THE BUILDERS'  
JOURNAL  
AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

*THE ART OF BUILDING.*

*IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze, for the man, too, who honestly plumbs a jamb. . . . .*

## An Architectural Causerie.

**The Misuse of Material.** THIS nineteenth century has been called by many names, and many qualities have been declared to be so characteristic of it, that it might be labelled and described by

century in a high degree, and that is the habit of misusing material. A large part of the production of the day is based upon this misuse, and the defect runs through manufactures of utility, those supposed to be things of beauty, those made by hand, and even in many cases through those productions of the cultivated brain and hand, known under the names of Art and Literature. If we walk the streets we see cement aping stone, cast-iron imitating qualities proper to wrought iron, or perhaps pretending that it is not iron at all, but something quite different; the walls above shop fronts apparently supported upon the edges of sheets of plate-glass, paint disguising the poverty of the woodwork of houses with the assistance of quantities of putty, or

ladies' dress is not free from the general defect—but here the pen must stop, nor dare to criticise, for, indeed, almost anything may be considered legitimate which increases the beauty of the fair sex. The reasons which prompt this misuse of material are two; the endeavour to produce a richer and more imposing effect than is warranted by the means at our disposal, and the determination to have novelty at any cost, congruity and seemliness being sacrificed without a pang. To point out an evil is easy, especially when it is so glaring as that under consideration; to discover the remedy is more difficult; yet a general return to greater simplicity of life would do much to set us in the right way. There are nations in which the sentiment for

ELGIN CATHEDRAL: SOUTH CHOIR AISLE, SHOWING CLERESTORY OF CHOIR.

them. For instance, it has been called a mechanical age, an age of invention; the liberation of men's minds and condition from every sort of trammels has been thought to have been accomplished, and has at least been attempted; though in the last few years the uneasy suspicion has arisen that after all the struggle it is but the form of tyranny that has changed. It is also the age of swift inter-communication, and of such publicity through the enterprise of journalism that the dislike which a few of us still have to our private affairs being made common property, and our little scandals served up as appetisers at every breakfast table, is almost resented by the mass of the public as being too "exclusive." But there is yet another quality which may be cited as characterising the

confounding brick, stone, or compo in one sticky mess. If one enters a house it is no better; the same confusion of qualities which should distinguish one class of manufactured articles from another strikes the eye, with the addition of strange forms of design in furniture, importing qualities quite unsuited to woodwork, and textiles in which the manufacturer has demanded from the designer something which it is impossible for the material to give satisfactorily. One goes aboard an Atlantic liner and is surrounded by a magnificence which suggests (no doubt, intentionally) absolute stability—marble walls—architectural forms such as would be in place in a palace, and decoration so conceived and executed that it is evident that any of the mishaps to which ships are subject must entirely ruin it. Even

Art rises to a passion, in which men will stint themselves of necessities that with the fruits of their privation they may become the happy possessors of something of beauty wherewith to glorify the bareness of their dwellings; the genius of the English nation is quite other, yet there was a time when English work was always solid and good, though it might lack the extreme grace and refinement which characterised the productions of more gifted nationalities. A considerable improvement has been effected in the last few years; is it past hoping for that the sterling English qualities may again become evident in English work, banishing the pretentiousness and imposture which so much surround us and make us to "walk in a vain show, heaping up riches?" S. S. G.

## On Reflection.

### Our New Volume.

WITH the present number, THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD enters on its ninth volume, and, in accordance with our announcements, it appears this week with certain fresh features which we hope our readers will regard as improvements. In the first place it will be noticed that a second double-page inset plate is given as a supplement; this, it is intended to make a regular feature of the journal. Then the "constant reader" will hardly fail to notice certain typographical changes which we think will be appreciated, not only as improving the appearance of the printed page, but as enabling the reader to see at a glance the subject matter of each paragraph. We have thought it advisable to extend somewhat the scope of our news columns. The building and engineering trades are so closely allied, and overlap at so many points, that a weekly column of "Engineering Notes" may form an acceptable feature in a journal devoted to the interests of architects and builders. The relations between employers and employed are matters in which all classes of our readers are more or less concerned. These matters we shall in future deal with under the heading "Masters and Men." As the questions which come under this category are often matters of keen controversy, a word as to our general attitude may be advisable. We hold no brief for employers or for employed; our business will be chiefly to chronicle events as

fairly and accurately as possible. We are in favour of all movements that make for industrial peace, and while we dissent from some recent developments of trade unionism, we are equally strongly opposed to a policy of "union smashing," whether avowed or concealed. Two other new features, which we think will be found of practical service to many, are the list of "Current Prices," which special pains will be taken to render reliable and up-to-date, and the diary of "Coming Events," in which will be found announcements of forthcoming meetings and other occurrences of interest to the architectural and building world. If our readers have anything to say with regard to these or any other features of the BUILDERS' JOURNAL AND ARCHITECTURAL RECORD, we shall be at all times glad to hear from them. Our wish is to meet the needs, as far as possible, of all classes of our readers, and though it may not be possible to adopt every suggestion made, the courtesy of a communication will be appreciated—none the less if it should chance to be in any degree critical.

### An Architectural Sculptor.

THE morning paper which gave us the names of the three new associates of the Royal Academy, told us also the sad news of the death of Mr. Harry Bates, at the comparatively early age of forty-nine. Although Mr. Bates had lately suffered a severe illness, he was thought to be in a fair way to complete recovery, and his death was sudden and unexpected. Mr. Bates, unlike the majority of the younger generation of sculptors, served a

long apprenticeship as an Architectural sculptor and decorator. He came to London in 1872, and, after studying at the Lambeth School of Art, became a student at the Royal Academy Schools, where, in 1883, he obtained the gold medal and £200 prize for sculpture. Subsequently, he pursued his studies in Paris. He, in common with such men as Gilbert and Onslow Ford, was an artist first and everything else afterwards; he was faithful to his ideals and fought bravely against the terrible difficulties which beset the career of a sculptor in this country. It is, therefore, sad to think that his life has been cut short before those hard struggles were ended, and at a time when brightened prospects promised in the near future. The Academy was always a good friend to the sculptor, and by allowing the erection of his statue of Lord Roberts in the courtyard in front of Burlington House conceded a privilege which we believe is almost without precedent. This noble statue, with its finely-designed pedestal, which will rank, perhaps, as Mr. Bates' greatest work, would otherwise have been overlooked, had not this opportunity for exhibition been allowed before it was transported to the site in Calcutta for which it was designed. Of his other works, his "Pandora" at the Tate Gallery is well-known; and the frieze at the Institute of Chartered Accountants will be remembered by architects, involving as it does principles in decorative sculpture which have been widely commended by theorists, although we do not find that the ideal has recommended itself at all widely to architects and sculptors. The large bronze bas-reliefs which many must have noticed in the doorway of a baker's shop in Kensington High Street, are early examples of the sculptor's art.

### London Nuisances.

WE are glad to see that the protests which have recently been reverberating through the correspondence columns of the daily press seems to have stimulated the vestry authorities to avail themselves of the powers which they hold to enforce an abatement of smoke in those cases where it constitutes a positive nuisance. The proprietors of the Criterion and Trocadero Restaurants and the Spaten Beer Buffet were each lately fined £10 apiece, at the instance of the Vestry of St. James, Westminster, for failing to comply with the notice of the Vestry ordering an abatement of the smoke belched forth by their several chimneys. It is hoped that the fines will stimulate the defendants in these cases in those efforts to consume their own smoke which they professed to be making; but such actions as these, directed against those who emit more smoke than their neighbours, will not contribute towards any substantial improvement of London's atmosphere. This can only be effected by some radical change in the heat-producing appliances throughout the metropolis. It has been computed that from November to March an average of 50,000 tons of coal is burned daily in London; this ejects into the air, under the usual conditions of combustion, 2500 tons of unburned coal or carbon in the form of smoke, with 1250 tons of sulphurous compounds. An ordinary fire-grate has an efficacy of from 5 to 10 per cent. only, and a range about 20 per cent. of the full capacity of the coal consumed. Coal gas, however, the use of which is gradually growing in popularity, yields some 90 or 95 per cent. of heat, and it is only its high price which prevents it from being a practical remedy for the "smoke nuisance." A writer in the "Morning Post" has however called attention to a recent German invention, the Dellwike gas. This gas, it appears, is easy to produce in large quantities at the price of about 3d. per 1000 cubic ft. It is nearly free from sulphur, and in combustion leaves only carbonic acid and water.

ELGIN CATHEDRAL: TURRETS OF EAST GABLE.

## ELGIN CATHEDRAL.

ELGIN CATHEDRAL: PLAN.

## ELGIN CATHEDRAL.

BY HENRY F. KERR, A.R.I.B.A.

THERE is nothing in the general appearance of the Vale of Moray to recall to the imagination the rough times of the Middle Ages. It is true that there are the remains of certain mediæval buildings; but these remains are few, and have to be sought for among their vastly outnumbering modern surroundings.

Strip of their ancient memories for many generations, they have had rather a hard time of it to survive, even in a ruinous condition, to our day. They are lonely remnants of the wild days when a man carried his life at the point of his sword. By-and-bye there arose such foundations as that of Elgin Cathedral, a casket of glorious fragments of Scottish Art from the twelfth to the fifteenth century.

Alas! it has suffered from the usage of the centuries that conceived it; but even if their hard buffetings often laid a grievous blow upon its walls, they also lay upon us a debt of gratitude, for something even finer often took the place of the earlier work that was destroyed.

What do we find as the record of its life? There was a fire, probably accidental, in 1270; and there is a tale of barbarity almost unparalleled in history—in 1390, when the fierce Wolf of Badenoch deliberately marched with his followers and set on fire one half of the town of Elgin. This was a case of unbridled revenge, and as it was executed in retaliation for the rebuke of the Bishop of Elgin—the Cathedral was specially marked out to be a victim for this nobleman's ignoble wrath.

The central tower, probably owing to bad building, collapsed in 1506, carrying to destruction with it probably a portion of the nave. Immediately, however, Bishop Forman commenced to rebuild the tower, which did not attain its full height (198ft.) until 1538.

Thirty years of comparative peace ensued, until the infamous order of the Regent Moray was given to strip the roofs of their leaden coverings in order to pay his soldiery; and it

is little to be wondered at that in 1637—nearly seventy years afterwards—during a gale the rafters of the choir were blown down.

All its life more or less beset with difficulties—now pecuniary, now depredatory—even in its ruined condition, fate still dealt unkindly with it. On Easter morning, 1710, the great central spire fell, burying with it in ruin the north transept and the nave. And what shall we say of later years? We are ever ready to make a catspaw of the reformers, but ruined as the noble building was on that Easter morning, yet much havoc has since been perpetrated by the cupidity of man, and his preference for a ready-made quarry when he can get it—cheap. Roughness did not stop at the middle ages. Indeed, it was more excusable then, and even although we bitterly mourn the careless, thoughtless, greedy actions of these miserable quarriers, we must be thankful that later better times have come. And doubtless, if we had lived in these times we might (had accident allowed it) been as eager quarriers as they.

The present remains consist of the ruins of a church which once could boast of a nave of five aisles and two western towers, north and south transepts, choir with side aisles, and an octagonal chapter house.

Although the Cathedral at Elgin was established in 1224, the See of Moray is much older. It certainly comes either second or third in point of foundation—i.e., either after St. Andrew's or Aberdeen. But there was no settled cathedral church of the diocese for a long while; the old Norman Church of Birnie (still existing), the Church of Kinnebar, and of Spynie—now entirely demolished—seemed alternately to serve the purpose.

The Church at Spynie was eventually, by the Pope's appointment, honoured as the Cathedral Church of the diocese. But in a few years it was represented that Spynie was a most inconvenient position, and in 1224 the Church of the Holy Trinity at Elgin was selected for this distinction.

If, as seems most likely, the south transept is a part of this early church, it must have been one of considerable importance and

dimensions. Although it may be difficult to imagine why there should be so large a church at Elgin, as these transepts would suggest, it is, I think, more difficult to imagine that this work is not earlier than 1224. It is true that the doorway abacus is circular, but that of the upper windows is square. The shafts are in all cases detached. It is probable, from the mere fact, perhaps, of the circular headed windows being over the pointed ones, that the lower ones more truly indicate the real date, and the upper ones were a mere hark back to an earlier phase; yet looking at the details, and more particularly looking at the masonry—which is entirely different from that of any other part of the building—it is borne in on the reluctant mind that notwithstanding the apparent improbability of this being the transept of a church at Elgin before it received the onerous burden of cathedral honours, it seems impossible that it owes its origin to a date subsequent to the foundation of the see there in 1224.

The north transept, of which the walls exist at a height of about 4ft., was evidently of similar design, and, judging by the masonry, was also of similar date.

The peculiar rubble masonry is observable both inside and outside of the transepts, and it is worthy of note, it is also found in the lower portion of the north wall of the choir—a most interesting portion of the ruins, of which more anon.

Andrew, the first bishop after 1224, was a man of influential family, and under his active rule not only was the ecclesiastical foundation considerably enlarged, but the church itself seems also to have been greatly extended. The nave may have been lengthened, but, at any rate, the west towers were added. They are 24ft. square and 84ft. high, as they stand.

By the existing weather moulds for the aisle roofs it is plain that the church was originally of three aisles, not five, as at present. Built-up windows in the west walls of the transepts also tell the same tale of the early church.

The arcade over the west door in the interior of the church is, I take it, of 1224 date, and it is of the same design as the clerestory

ELGIN CATHEDRAL: WEST FRONT.  
1224 TOWERS, 1270 DOORWAY, 15TH CENTURY WINDOW.

arcade in the interior of the south transept, except that the larger arches are pointed in place of being round.

Now turn to what is left of the north wall of the choir. In the clerestory we perceive that the lights are not all of the same design. Two perfect ones and the joint of a third are shorter than the others to the east. These short lights are, I believe, a fragment of the clerestory of Bishop Andrew's church erected immediately after 1224. The details are similar to the later lights, but not identical.

The second point is this, that the bays of the clerestory lights are not centred with the vaulting bays of the aisle. This might suggest that the aisle was of later date, but if we examine more closely we shall observe that, while this is partially true, it is not the whole truth.

If we closely inspect the masonry in the second bay, underneath the second pair of clerestory lights, we observe indications of some alteration, and if these are traced out, we discover something highly suggestive of a pointed window having been obliterated by later masonry. The head of the pointed arch will be noticed just breaking through at the apex of the wall rib in the vaulting, and indications of the building up of a high window are visible under this. Further observe that immediately east of this a heavy buttress is abruptly broken off above the vaulting, clearly showing some alteration; and there is thus clear evidence that (1) the aisle is later than the choir wall, and (2) that this wall was originally an outside wall and pierced by a window in the eastmost bay.

But this does not exhaust the indications of change. It cannot fail to be noticed that the wall of the choir above the vaulting is rough, and consequently has never been an outside surface, and the portion of the aisle here was doubtless vaulted. This may have formed the Sacristy of the 1224 church. How far east the 1224 church extended, we have no means of guessing, only unearthing the foundations could reveal it.

Subsequent to the accidental fire of 1270, the eastern portion of the choir and clerestory was built, and evidence is obtained from the broken buttress already alluded to and the small strip buttress one bay further east, that no aisle was then intended. The strip buttress goes down the wall face, and when the aisle was added a portion of it was covered up by the vaulting.

As we shall presently see, the choir did not long remain aisleless.

Let us for a moment return to the 1224 clerestory and the built-up window. Here we have the interior wall of the clerestory, where we can see the variation in the design already alluded to. But look below the clerestory, and faint indications will be observed of a built-up arcade, similar in general scheme to that over the west doorway and in the south transept.

Now, a most important point in this connection is that the centre of the window just discernible as built-up on the outside coincides with the most easterly large opening of this arcade, thus uniting the two obliterated early features—the one inside and the other outside.

Before passing from this portion of the building let us note the sudden drop of the level of the clerestory passage. The old level is 18in. above the later one. The later level is continuous round the east end, and the south wall of the choir.

I do not take it as a mere coincidence that the clerestory level as shown on the east side of the west towers is exactly 18in. above the choir clerestory, or exactly the same as the fragment of the 1224 clerestory we have just been describing. I deduce from that fact that the nave at the west towers was of 1224 date, and indeed the general evidence which we have already been considering, and an examination of the details will fully bear this out.

On the interior face of the north wall of the choir, and at its base, are evidences in the masonry of this being a wall of similar date (as similar masonry) to the transepts, i.e., of the church existing before 1224.

The two great responds, one on either side of the choir, were most probably united by an arch. But when the outer aisles were added, and the buttresses were cut off in their lower parts, and the necessary abutment thereby removed, this arch would be taken down. And at a later date the elaborate finials were erected as a unique crowning feature above the caps.

The north wall of the choir was solid, but the south wall was open to the south aisle.

Probably it was while the new choir was being erected in such magnificent fashion that it was decided to erect a separate chapter house, and consequently a north aisle to the choir with access across it. The chapter house, as we shall see, is of two dates, one subsequent to 1270, and one fifteenth century.

A near view at the clerestory level of the choir shows the very beautiful detail of this portion of the old cathedral. Observe the care with which even the loftiest portions of the turrets are treated, and even on the side which would be quite hidden if the roof were on the building. As a matter of design and detail it would be hard to instance any building that equalled this; none could excel it. There is grace of design, superb proportion, the utmost delicacy of detail, and, although there is ample ornament, there is, withal, a repose and restraint which makes the work most fascinating.

The general design of the choir clerestory can be made out from this view, and also that of the south choir aisle.

This aisle and the corresponding north aisle of the choir are of the same date, judging by the design and details, which are practically identical; but they must either have been rebuilt, or at least have had new windows inserted subsequent to the barbarous incendiarism of that royal marauder, the Wolf of Badenoch. The buttresses and the walls under the sill level are probably original.

The only fragments of the nave remaining are two windows, the jambs of a third one, and the inner doorway and wall of the south porch. The two windows appear, on a superficial view, to be the same. In dimensions they vary slightly. The general design is similar, except the circle in the window head, which in the eastern one is filled with four pear-shaped apertures, and in the western one with three only. But the detail of the tracery is very different; that one which now is almost denuded of its filling is of much more beautiful design, and is probably the older, the other being an inferior copy of much later days.

I am very sceptical about the skew which is built up above one of the windows:—

1. It is extremely steep in pitch—far steeper than even the main roof for example, and if continued up to the centre of the bay, would finish well above the level of the sills of the nave clerestory lights.

2. It certainly did not start where it is shown, for the wall head must have been (as clearly indicated by the weathering on the west tower) about 2ft. higher.

There is no doubt that the two windows partly entire had gables over them, but, judging by the weathering for aisle roof on the tower, and on the transept walls, gables did not probably surmount any other window.

By far the most interesting part of this fragment—and one of the most interesting in the whole building—is the jamb of the window

adjacent to these, and nearer the south porch. It is rather surprising to find work of such an early character on the outer aisle wall.

There is no doubt that the original church existing in 1224 had only three aisles to the nave. There can be little doubt that the nave and choir were either rebuilt, or extended after the transference of the See to Elgin, and from remains of weather moulds on the north tower, it is plain that then the church had only three aisles. But here we meet on the outside wall of a five-aisled church early detail. The most probable solution of the problem is that either owing to the destruction of part of the nave in 1270, or owing to abundance of funds—or both—it was resolved to extend the already famous building by greatly increasing its width, from three to five aisles, so that it must, when completed, have presented a magnificent appearance within and without.

The facts that the south porch is similar, and that both exhibit similar decoration to that of the eastern portion of the choir, lead us to conclude that these works were carried out at some time shortly subsequent to 1270. If our conjecture is true, the building must have been almost transformed from a beautiful but modest cathedral church to one of very exceptional effectiveness: for not only was the choir greatly extended with its aisles, but a chapter-house was built adjoining, and the nave increased to one of five aisles.

The western portal, we may truly say, is the finest in the land. One never tires of studying it. If you gaze at it with half-closed eyes you get the true feeling of its power and grandeur, while examining it more closely you are charmed with the richness and variety of its design. Although the west towers were added after 1224, and doubtless a new west doorway was then constructed, this one is clearly an incision in earlier work, and of 1270 date, another proof of the rich inpouring of funds at that period, which enabled the bishop to so glorify his church.

(To be continued.)

## THE ARCHITECTURAL ASSOCIATION.

### HOW STAINED-GLASS WINDOWS ARE MADE.

BY CHRISTOPHER WHALL.

AT the meeting of the Architectural Association, held last Friday, Mr. J. Fellowes Prynne presided. The following new members were elected: Mr. F. J. Palmer, Mr. J. H. Taylor and Mr. A. S. Vernon. A lecture and demonstration on "Stained Glass" was given by Mr. Christopher Whall. The lecture was illustrated by a number of specimens of work done by Mr. Whall's pupils at the Central School of Arts and Crafts in Regent Street, and by some of Mr. Whall's own cartoons. After asking permission to break through some of the traditions which ordinarily guide the debates of the Association, and give instead of a formal paper what he called a regular work-bench talk, Mr. Whall proceeded:—

I would like in the first place to ask two questions: What do you want to know about stained glass? And, why do you want to know? These are curious questions to ask perhaps, but I ask them because on the last occasion of my visit here, when Mr. Wilson gave his admirable paper on "Glass" generally, one who spoke with great weight and authority took exception to the line taken by the lecturer, and to the general drift and conclusion of his remarks. He said "he should not like to suggest that the roads they were pursuing under the sanction of almost everyone who had written on the subject were wrong. What they had heard was the view of a pessimist. He failed to see any evidence to justify this view. Surely sooner or later they would evolve something in the shape of invention, and themselves influence opinion. There was no need for discouragement." That was a

rather exaggerated criticism of what was itself rather exaggerated. I did not gather that there was anything in Mr. Wilson's attitude as a craftsman antagonistic to the ordinary curriculum which you go through in your offices under your architectural masters, or practice for yourself if you have started on your own account.

I think we may do something to-night to bring the two points of view somewhat closer together. But it does become a serious question to ask at the outset the reason why and the degree in which you should interest yourselves in the crafts. I am here to interest you, if I can, in one of them. So I will first show you briefly how it is practised, then how far it lies in your power to gain practical knowledge of it without sacrificing your career. By that time I hope we shall have got sufficiently in touch with one another for the rest of the meeting to take the form of question and answer and explanation.

Let me describe the actual production of a stained glass window. First of all the client wishes for a sketch. He wishes to see what you have in your mind appropriate to the situation of the window. The next step after making the small sketch is to reproduce it in the form of a full-sized cartoon. The cartoon should always be made by a craftsman—by a man who is intimately acquainted with all the processes of stained glass work—that is essential. The reason for this is that when these little sketches come to be translated, the whole finished work must be seen in

the mind's eye of the draughtsman, so that he may make the best use of his material. A mere draughtsman is not in a position to take up work of that kind. He may make a beautiful drawing, but if he has never touched the glass he does not know what its limitations are. He has never considered that to make a beautiful drawing for a canvas is altogether different from making a drawing to be cut up into small pieces with black lead between them. Therefore the drawing should be made by a practical man. The rule I adopt is to make as beautiful a drawing as I can, putting in as few working lines as possible—only those which indicate great masses of colour. After making the cartoon I set it with spray, so that it is indelible, and then draw over it with charcoal the remainder of the working lines. But I have conceived the whole in my own mind, so that I know at starting what I have to do.

The next thing is to make a tracing showing the leading lines only. The whole of the work is carried out by that tracing. First of all, the glass is laid upon it and cut to the pattern required, leaving it one-sixteenth inch short of the actual size, so as to allow for the core of the lead. The next step—a very important one—is the painting of the glass. The pieces of most importance—the head, hands, and anything that is elaborate in form—are laid down on the cartoon horizontally and traced with the pigment, which consists of oxide of iron with some flux which will melt it when put into the fire. After the pieces are

ELGIN CATHEDRAL: EAST END.

R.I.B.A. PRIZE AWARDS: SILVER MEDAL FOR MEASURED DRAWINGS. MOULDINGS ON NORTH PORCH, ST. PAUL'S CATHEDRAL. DRAWN BY HENRY ERNEST KIRBY.

all traced, they are waxed up and placed on a glass plate which has light behind it. For the waxing process you need a saucepan of wax; a slip of glass is dipped into it, so that the spots of wax are conveyed to every corner of the glass. There is one practice, almost exclusively my own, which I think very useful; that is the making of a sketch to scale in the material itself. This is to guide the craftsman by giving an indication of the appearance of the finished work. Of course that is a great deal of trouble to take; for years I did make a small sketch of that sort, though I do not do so now in one case out of ten.

Now we are ready for the actual painting. An opaque pigment is laid on in "mat" as it is called, that is with an even surface, answering much the same purpose as a ground in mezzotint, a ground brought to a perfectly even and smooth consistency, and then lightened with various tools, chiefly hog's-hair brushes worn down to the stump. One way in which this shading is done is by stippling, in which the glass is worked in a succession of spots; by this means you can lay a very perfect ground, supposing it is your object to get a very delicate tint. One can take just as much shade off as one wishes, in fact, in this way, a perfectly finished shaded drawing might be worked up, supposing it could be kept wet long enough.

The next process is the firing. The pieces are taken off the plate, the wax is chipped away from the edges, the work is laid on trays which go into the kiln; there it is subjected to intense heat, which softens the glass sufficiently to allow the pigment to penetrate into it. Here, of course, crops up an immensely important question with regard to stained glass—the question of permanency. On this I would only say that as a general rule I believe all the controversy about the use of this or that pigment is a mistake, and that the whole question depends upon whether the work is sufficiently fired or not. Those who fire high make sure that their work is to be permanent at the expense of losing a great deal of the painting by the way. Work that is fired in this way must be painted twice as dark as it is to be when finished. It is necessary to allow a very wide margin for what the kiln will do in the way of undoing the work, and perhaps a second painting may be needed, so that you may add what has been lost in the

fire. If you are fortunate enough to secure that without losing it again, your window is finished, with the exception of what is called the "yellow stain." The virtue of stained glass does not consist in anything put on the surface, except the shading; the virtue consists in the colour of the glass itself, which is coloured throughout its whole bulk. There is this one exception of yellow. In the fifteenth century it was discovered that there was a perfect pigment by means of which stained glass of any light colour could be brought to any depth. You can paint on the glass what will become any colour from primrose up to ruby by the action of the fire. This pigment takes a very low degree of heat, and yet the stain is perfectly permanent. The danger is that one is tempted to overdo it; it is wise to be reticent in its use, so as to avoid making the window look bilious.

That brings to my mind the use of white glass. The pigment in which we shade is rather warm in colour. The most satisfactory of all pigments as a working material is that which approaches most nearly to the colour of red lead; the purer you get it the redder it is. It is so unsatisfactory as a colour upon glass to paint your window in a hot red-brown that you may get out of the difficulty by using the greyer pigments which fire away much more; or you may use a greyish glass as your highest white. That seems to me a disastrous thing; we have lately had a run of windows painted in this way, with their highest white a greenish grey. If this is done you lose the pearly white which is the glory of the old stained glass. White glass is essential for the obtaining of good effect; to use anything else as your highest light is giving up the game to a great extent.

After the window has been painted and fired, it has to be leaded out. The whole thing is laid down upon the bench and put together like a child's puzzle; the lead is put round it, the pieces are kept together by horse-shoe nails, then the joints are fixed together by solder. Finally the whole is cemented; this makes the window hard and stiff, and also waterproof.

Such is the process of making a window, as far as I have been able to describe it. Now there are several practical questions which appeal to you as architects. How much do you require to know about this sort of thing in order to be able to direct it? I do not think you want to know anything about it which would take a very enormous slice out of your career in order to learn it. In order to show you that such is the case I have brought here some specimens of work done by my pupils in the School of Arts and Crafts in Regent Street. That is a craft school, not a school for theoretical design. Therefore everything here, except the designing, has been done by the pupil himself. Those who previously

have been merely educated to paint the thing from the cartoon are here required to learn, or, at any rate, to fumble through, the processes of cutting and leading and painting the work. The pupil is required to know enough of his material to be able to deal with it in a practical sense. It cannot but have a good influence upon a man when he is painting on a material to know, at any rate in an amateur sense, what the material will do and how it is to be dealt with.

I think that is very much an answer to the question often raised, how far it is possible for an architect, with all the demands upon his time and the exigencies of his training, to take up any of the crafts to a useful end. If it was demanded that an architect should take up a craft so as to be master of it, it seems to me that in these days that would probably be impracticable. But there is a great deal to be learnt in a short time; the mere touch of the stuff gives you a fresh view of it; you do not then feel the same in regard to it as when it was to you merely a book illustration. I am sure this familiarity has a vital influence upon the design of those who practice the craft, because it is not architects alone who direct these things with less knowledge than one could wish; it is also those who carry out the work. Stained glass windows are almost universally produced with labour so divided that not one of those engaged on a portion of the work could have done the whole work himself. It must be a good move that those who produce the thing should be able, on occasion, to produce the whole of it. At the Arts and Crafts School we endeavour to make the pupils masters of their craft, so that they can, if necessary, lead the piece of work up as well as paint it.

An interesting discussion followed, and Mr. Whall replied at length to the questions asked. Our report of these subsequent proceedings is held over till next week.

## FIRE PREVENTION.

### A NEW SYSTEM OF FIRE TESTS.

THE British Fire Prevention Committee, which was founded by Mr. Edwin O. Sachs, the well-known architect, shortly after the Cripplegate Fire of November, 1897, has just taken a new and important step towards the realisation of its objects. This is the opening of a testing station, where materials and systems of construction may be submitted to independent and scientific tests with a view to ascertaining the exact measure of their fire-resisting capacity. Nothing of this kind on so large a scale has hitherto been attempted; a few independent tests have been

R.I.B.A. PRIZE AWARDS: SILVER MEDAL FOR MEASURED DRAWINGS. PLAN OF NORTH PORCH, ST. PAUL'S CATHEDRAL. DRAWN BY HENRY ERNEST KIRBY.

made in America, and a number of individual makers of fire-resisting specialties in this country and elsewhere have carried out tests on their own account. But this is the first testing station that has been established where the procedure is absolutely unbiassed and scientific. The arrangements of the testing station are in the hands of an executive committee, which includes a number of eminent architects, surveyors, and engineers. The tests are to include investigations into the fire-resisting qualities of ordinary methods of construction as well as of special systems. The maker of a fire-resisting system of construction who wishes to have it tested and hall-marked, so to speak, by the Committee, can do so by paying the exact cost of the test. The Committee will record with tables and diagrams the bare facts of the test, without any comparisons or expressions of opinion; the Committee's object being not to propound theories, but to ascertain facts.

The methods by which this object is sought to be accomplished were demonstrated to a number of press representatives at an experimental test, conducted at the testing station, on Jan. 31st. The station comprises two houses, standing in their own grounds, near Regent's Park, and backing on to Regent's Canal. The principal building is used for committee rooms and laboratory purposes, and in the gardens at the back have been erected three brick huts, each 10ft. square. Here the larger tests are conducted. The fuel used is gas, which is made on the spot. The gas producer is worked by a steam boiler, and the gas passes through a main gas pipe of 18in. diameter into smaller pipes, which convey it to the brick huts. By this means the temperature can be regulated as desired. The temperatures are recorded by two of Professor Roberts-Austen's pyrometers, placed in the house and electrically connected with the testing chambers. On the occasion of this experimental test an ordinary solid joist floor, protected with iron below, had been built over one of the testing chambers, and was subjected to a heat of 1300 deg. Fahr. The arrangements were in the hands of Mr. Sachs, the chairman, and a sub-committee of the executive, comprising Mr. Frederick R. Farrow, F.R.I.B.A., Mr. Max Clarke, A.R.I.B.A., and Mr. Robert Mond, M.A., F.R.S.E. The experiment on this occasion was, of course, of no particular scientific importance, being merely designed to show the kind of work it is intended to carry out at the station. It may be interesting, therefore, to give a few notes of another experimental test that had been carried out a few days previously:—

The object under investigation was an ordinary pugged floor which would meet with the requirements of the Building Act, the specification being drafted by Mr. Woodthorpe, M.A., F.R.I.B.A., District Surveyor to the City of London (Northern Division). Three variations of pugging were used with wood joists. The floor was built in the ordinary way over the testing chamber, and had been given six weeks to dry. The test applied was a fire test of an hour's duration, at temperatures varying from 1800 to 2300 degrees Fahrenheit, followed by the application of water under 40lb. pressure from a manual engine for 1min. 30sec. No load was put on the floor nor had it to withstand the shocks of falling weights. The temperatures in the chamber were in this case solely recorded by Professor Roberts-Austen's pyrometers (No. 47 and No. 48), each working from two thermo-junctions and registering automatically.

An effort is made in these tests to reproduce, as far as possible, the actual conditions of a real conflagration. To this end the floors are sometimes loaded, or weights are dropped upon them, and water is applied under varying pressures. It will thus be seen that every effort is made to render the tests not only independent and scientific, but of real practical value to all who are concerned in the construction of buildings.

## R.I.B.A.

### PUBLIC BATHS AND WASH- HOUSES.

By A. HESSELL TILTMAN, F.R.I.B.A.

AT the meeting of the Royal Institute of British Architects on Monday evening, the President, Professor Aitchison, R.A., presided. It was announced that the Council had decided to submit to the Queen the name of Mr. G. F. Bodley as a fit recipient of the Royal Gold Medal, 1899.—A paper by Mr. A. Hessel Tiltman, on "Public Baths and Washhouses," was read by the secretary, Mr. W. J. Locke. Mr. Tiltman opened his paper by an expression of his personal views upon the ordinances which should govern the arrangement of baths and washhouses in the future, and their influence upon the arrangement and details of their various departments. The Baths and Washhouses Act, 1846, was passed "to encourage the establishment of public baths and washhouses. The municipal duty, however, of providing facilities for the cleansing of the bodies and linen of the poor had not been adequately performed. Statistics showed that only a small proportion of the class for which these establishments were chiefly intended availed themselves of the opportunities offered. The reasons for this partial failure, the author considered were—First, that the initial distribution and classification of the establishments were frequently at fault; secondly, sufficient effort was not made to educate the masses as to the necessity and benefits of the bathing habit. The bathing community to be catered for consisted of the middle class, the working class, and the very poor. A great initial blunder was committed in associating these in large proportions for all purposes of swimming, bathing, and washing, in almost every establishment. The remedy lay in the practical adoption of some system of

**Central and Branch Establishments,** classified and distributed to suit the special needs of each district. Ablutionary baths and public wash-houses should be decentralised and located at much more frequent intervals throughout those districts requiring them, forming a series of branch establishments; whilst swimming baths should constitute centralised establishments at one or more points, equally dividing up the whole district. The author then enumerated the requirements of the suggested establishments. The central establishment should be the chief and most attractive. The branch establishments should consist of two types:—(1) Baths and wash-houses; (2) People's baths. Either type could be put upon the site of from two to four small houses in a by street, which would be neither costly nor difficult to acquire. In extending the provision of baths and wash-houses, the authorities should consider the advisability of doing so in the direction of branch rather than central establishments. The author had visited and inspected a very large number of baths and washhouses throughout the United Kingdom, and on the Continent. A committee of medical and other experts in New York, after careful investigation, had reported their preference for the arrangement and administration of the new form of German and Austrian "People's Baths." The distinguishing features and hygienic advantages having been fully explained, the author went on to describe the plan and arrangement of each of the three classes of typical establishments advocated by him.

#### General Arrangements.

The central establishment site should have a superficial area of from 30,000 to 40,000 square feet, be in a prominent position, and easily accessible from all parts of the town or parish. It should admit of the perfect drainage of all portions of the establishment without necessitating an expensive treatment of levels of the building generally. Much saving may be effected by having only a small frontage towards the main thoroughfare.

A good site may often thus be secured, carrying with it sometimes sufficient frontages to back streets, where minor entrances may be provided. In baths carried out for the Islington Vestry, the author had adopted the quadrangular system to such a site as that described with excellent results. The water supply must be abundant, pure, and soft. There should be storage for some 15,000 to 20,000 gallons; ponds of very large size are not advisable. It is better to increase their number rather than their dimensions when the latter exceed 90ft. by 30ft. Five is a useful number for central establishments; two for each of the sexes, and a fifth or small pond to be used alternately for both sexes, principally as a teaching pond. In England swimming baths were usually closed during six months of the year; but, with adequate warming and other arrangements, as in Germany, where, though much colder, swimming baths were open all the year round, swimming clubs would gladly use them throughout the winter months. The arrangement of one of the swimming baths during the winter months for public entertainment purposes was next considered, and the best means of meeting the County Council requirements in the matter of exits, &c. The location of hot-air baths, laundry, boiler-house and engine rooms, apartments for superintendent and engineer, &c., having been indicated, the author went on to deal with the details affecting the various departments, viz., swimming baths for both sexes, douche or cleansing rooms, slipper and rain-douche baths, hot-air baths, the establishment working department, boiler-house, engine room, accumulator room, receiving room, washhouse, drying room, folding and distributing store rooms, mess room, engineer's workshop, and the administrative department.

#### Swimming Baths.

A defect requiring correction in English swimming baths was the insufficiency of dressing-box accommodation in proportion to the superficial area of pond surface. The almost universal arrangement of placing the dressing-boxes down two sides, and possibly one end of the hall, must be improved upon. This might be done by adopting the Continental method of placing an equal proportion of the dressing-boxes upon the gallery floor, or by arranging them in a series of transeptal bays upon one or both sides of the bath. The pond should be rectangular in shape, and in the proportion generally of length to width as 3 to 1. Steps to the water should be of wood, and made removable. An open self-draining channel, close to the top of the pond and running continuously round it, serves as a scum overflow and spitting trough, and a suitable height above the water-line an iron or copper safety rail should run all round the pond for the use of tired swimmers. At the shallow end a portion of this rail is usually converted into a spray pipe, extending the whole width of the pond. By raising or depressing the direction of the perforations in this, a useful and pleasant means of freshening and clearing the top surface of the water is obtained. Further points considered in this connection were the depth and temperature of the water gangways round the ponds, flooring materials, dressing-boxes and their fittings. An important feature of the swimming bath should be the douche or cleansing room. This is almost unknown in this country in connection with swimming baths; but it is a universal provision of the German baths, and used by every bather as a matter of necessary routine, it being understood that before entering the swimming pond he should, out of consideration for his fellow bathers, undergo a thorough cleansing process.

#### Hot-Air Baths.

These should be upon the lines of the improved form of the Anglicised Turkish Bath, consisting of three rooms, viz., the tepidarium, 140deg. Fahr.; the calidarium, 180deg.; and the laconicum, 250deg.; together with a combined cooling and dressing room, and a shampooing and douche room. For the second-class hot-air baths the author recommended the

system suggested in Metcalfe's "Sanitus Sanitatum et Omnia Sanitas," which consists of a combination of hot-air rooms of the Turkish bath with a system of warmed lavatories, in lieu of the shampooing process and plunge bath. This modification of the Turkish bath, for ordinary purposes of ablution, would be perfectly effective, less provocative of colds, and more economical than the ordinary warm slipper bath.

#### Public Washhouses.

In considering the second part of his subject, "Public Washhouses," the author said that their present arrangement required complete overhauling. Full details of a small installation were given as an indication of the line modification should take. The following rooms were described and illustrated: Public wash-houses, mangling room, waiting hall, cloak and bonnet room, crèche, ticket office. Reverting to bathing establishments, the author explained that the smaller type of his branch establishments, viz., people's baths, was intended to meet, in the cheapest and simplest manner, the needs of the very poor for cleansing facilities. It consisted of very small establishments of rain-douche baths, built at very frequent intervals, in the poor and populous districts, after the manner of the Germans and Austrians. These establishments could be made so small and compact as to permit of their erection under our streets, in a manner similar to our underground lavatories.

#### Architectural Treatment.

Finally, the author touched upon construction and architectural treatment. Construction should be of such a character as to resist the action of water in every form, whether from carelessness or from the necessities of frequent cleansing. It should be easily kept clean, free from vermin, and especially so with respect to the transfer of contagious matter. As to external Architecture, the design of the building should clearly express its purpose, quite apart from all questions of style. It should appear exactly what it is, and not ape the dignity and expression of the modern town hall. In the treatment of the natural outcome of the plans, there are infinite opportunities for original and distinctive work. The paper was illustrated by a large collection of plans of baths in England and on the Continent, including the Kennington Road Baths, Hornsey Road Baths, Tibberton Square Baths, River and Public Baths at Hamburg, and "People's Baths" at Hamburg and Vienna.

#### The Discussion.

Mr. W. Emerson, in a few sentences, proposed a vote of thanks to Mr. Tiltman for his able and interesting paper.—This was seconded by Mr. H. L. Florence, who remarked that he had no doubt the system of the douche would be much to the advantage of the populace generally, if they could be induced to take kindly to the novelty. He did not quite agree with the suggestion that York stone should be used for the landings round the baths, being of opinion that slate was both pleasanter and more easily cleaned.—Mr. A. T. Bolton referred to the difficulty of minimising the noise that came from a swimming bath. He thought the noise arose largely from the excessive amount of glass in the roof. Every splash was echoed from the glass roof. He suggested that if the amount of glass could be restricted, the inconvenience arising from this cause would be greatly diminished.—Mr. Saxon Snell said that anyone who had had the privilege of going over the new swimming bath at Shoreditch would feel that a very great stride had been made towards the ideal. With regard to small bath establishments, he thought great economy might be effected by using them alternately for men and women; this would be quite practicable, because women generally bathed in the morning and men in the evening. He quite agreed that many small establishments were to be preferred to a few large ones.

Professor Aitchison, in putting the vote of thanks to the meeting, expressed the hope that slipper baths "and other abominations" would be done away with as soon as possible.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### APPROXIMATE ESTIMATES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly give me some information with regard to the customary prices per cubic foot for (1) middle class dwelling houses, (2) hotels, (3) churches, (4) schools, (5) warehouses, (6) hospitals. Should dimensions be taken from bottom of concrete, or from ground line?—Faithfully yours, Cardiff. "CUBE."

The cost of building is rising rapidly just now at the rate of about 5 per cent. every three months. At present the prices are approximately, per cubic foot: (1) middle class dwellings 8½d., (2) hotels 10d., (3) churches 1s. to 2s., according to elaboration, (4) schools 7d., (5) warehouses 6d. to 8d., (6) hospitals 9d. to 1s. Dimensions should be taken from bottom of concrete to half way of roof.

### GWILT'S ENCYCLOPÆDIA OF ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you kindly favour me with the date, price, and publisher's name of Gwilt's "Encyclopædia of Architecture"? Also please say if it is a book of instruction or for reference.—Yours truly, A. B. Clifton.

Gwilt's "Encyclopædia of Architecture" is published by Messrs. Longmans, Green, and Co., and costs 52s. 6d. A discount bookseller will supply you with it for less. There was an edition issued in 1891, and we believe this was the last. The 1888 edition is, however, recommended to students by the R.I.B.A., and you might obtain a secondhand copy from Messrs. Batsford, High Holborn, London. The book, which runs to nearly 1500 pages, constitutes a concise but comprehensive survey of all subjects pertaining to Architecture, both theory and practice. It is much more than a book of reference, and should be possessed by every architectural student.

### REMOVING PAINT AND WHITE-WASH FROM BRICKWORK.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly elicit from your correspondents the best mode of removing paint and whitewash from red brick exterior, to restore to original colour? T. T. High Wycombe.

To restore to its original colour a red brick exterior which has been coated with paint or whitewash is, to all intents and purposes, an impossibility. But possibly something less than complete restoration will suffice. "Whitewash" is a vague term, and may mean anything from limewash—bound with tallow or oil—to distemper. If limewash, the brickwork is well nigh past hope, as nothing less than scraping every inch of the surface will remove it; a stiff wire scratch-brush would be useful. If distemper, wash off the coating as far as possible in the ordinary manner, then go over the work carefully and thoroughly with stiff bass dandies, using plenty of clean water. To remove paint, make up a "pickle" of freshly-burned unslaked lime and ordinary washing soda, in the proportion of 3 to 1, with sufficient water to make a creamy liquid. Apply this—whilst still hot, and using worthless brushes for the purpose—to the surface of the paint, and continue the application until the paint is dissolved. Follow on with plenty of clean water, applied with dandies, and when the brickwork is as clean as it can be got, go over

it again with a solution of weak acid—sulphuric or acetic (ordinary vinegar will do) in sufficient quantity to give the liquid a slight acid taste—in order to neutralise any alkali still left in the pores of the bricks. Then give another wash with clean water, and the work is ready for any further treatment. It would probably be found desirable to rake the joints, colour the brickwork, and then to repoint the whole exterior. The colouring is done with Venetian red, toned to colour required with Spanish brown, 2lb. of dry colour being stirred into from 1 to 1½ gallons of water, and ½lb. of white copperas being added to this quantity in order to "set" it.

### BOOKS ON ARCHITECTURE AND HERALDRY.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Would you please to be good enough to tell me through the Enquiries column which you consider the very best book to get, at a moderate price, in order to acquire a general knowledge of Architecture, also for Heraldry. I have seen Statham's "Architecture" and Cusson's "Heraldry" often mentioned. What do you think of them? Thanking you in anticipation,—Yours truly, Glasgow. W. REID.

Both the books you mention can be recommended. For further books that would serve as introductions to the study of Architecture see an answer to a correspondent on p. 319 in the BUILDERS' JOURNAL for December 21st, 1898. Another good book on Heraldry is Bentell and Aveling's "Heraldry: Ancient and Modern." Some articles on the subject are in hand for publication in our columns.

on the two brackets springing from the sill. It is intended to be framed out of 2in. stuff, with 1½in. cross rails and 1½in. panelling; the roof of ½in. oak shingles. The back should be hinged to give access for cleaning. Either teak or pitch-pine would look well, to be finished by oiling and varnishing.

**A Road-Makers' Exhibition.**—At the Building Trades Exhibition, to be held at the Agricultural Hall from April 26th to May 6th, a section of special interest to surveyors and sanitary engineers will be that organised by The Surveyor. The exhibits will relate to road-making methods and appliances, and, judging from the programme we have seen, these subjects will be illustrated in a very comprehensive manner. In connection with the Exhibition arrangements are to be made for meetings at which papers of interest to municipal engineers, members of local bodies, and others, will be read and discussed.

## Keystones.

**Mr. Ruskin** is eighty years old to-day.

**Plaistow's new Mission Church** of St. Thomas has been opened.

**The Local Government Board** hold more than 1000 public inquiries every year, and sanction loans for about £9,000,000.

**St. Luke's, Dublin**, is about to be closed for repairs and improvements. The roof is found to be in a very bad condition.

**Stafford Workhouse** is to be enlarged at a cost of about £2000. At the last meeting of the Board of Guardians it was decided to have plans prepared.

**A monument** erected in the Cathedral of Carthage to the memory of Cardinal Lavigerie, a former Archbishop of Carthage, was unveiled last Sunday week.

**Mr. Fred. Mitchell**, architect and surveyor, has removed to more commodious offices on the ground floor at 9, Upper Fountaine Street, Albion Street, Leeds.

**Perth and District Tramway Company, Limited**, have obtained permission from the Perth Police Commission to use the electric traction on their lines.

**A monument** in memory of Mr. Edward Stanhope, M.P., was unveiled last Thursday at Horncastle. The memorial is 32ft. high, and was erected by public subscription.

**Battersea Polytechnic** was opened in 1894, but the great hall, which formed part of the original scheme, has only just been erected. This was opened by Mr. Arthur Balfour last Friday.

**The Parish Church at Great Hampden**, Bucks, wherein John Hampden is buried, is to undergo a much-needed restoration. Of the £2000 required to preserve the ancient building considerably over half has been raised.

**A handsome pedestal**, provided by Mr. Charles Wertheimer for Bernini's bust of Cromwell, has been erected in the House of Commons; the memorial stands at the foot of the stairs leading to the Committee Room passage.

**Munificent Gift to Liverpool.**—It is announced that a Liverpool gentleman, whose name has not transpired, has bought a plot of land near the Custom House with the intention of erecting buildings to cost £20,000, chiefly for the use of sea-going people.

**New Market at Aberavon.**—In the recent competition for a new market at Aberavon, South Wales, twenty-two sets of designs were sent in, the ones selected being those of Mr. Frank S. Biram, of St. Helens, who has been appointed to carry out the work.

**A New Mission Church**, to accommodate 300 worshippers, has been erected at Graiseley, Wolverhampton. It has cost about £1000, including furniture and fittings. The builder is Mr. F. Skett, of Wolverhampton, and the architect, Mr. F. T. Beck, also of Wolverhampton.

**A light railway scheme**, promoted by the Penzance, Newlyn, and West Cornwall Light Railway Company, has received the approval of the Light Railway Commissioners. The object is to construct a line, to cost £150,000, to connect Penzance with the Land's End district.

**The Boadicea Statue.**—At the meeting of the London County Council on January 31st it was agreed to expend £1500 in the provision of a granite pedestal on the wall of the Victoria Embankment on which to erect the Boadicea statue group presented by Mr. J. I. Thorneycroft to the Council.

**A new pulpit** has been erected in St. Andrew's Church, Avonmouth, as a memorial to the Rev. David Wright, the first vicar of Stoke Bishop. It is substantially built of Bath stone with an elaborately carved border, and has sculptured figures in three of the panels, and an inscription in the fourth. The pulpit is from the design of Mr. Wood Bethell, of London, and it has been executed by Messrs. Hems, of Exeter.

**A municipal lodging-house** has just been opened in East North Street, Aberdeen. The building has cost £16,500. Accommodation is provided for men only, and the bedrooms, or cubicles, altogether number 252. The premises are well equipped, and fitted throughout with electric light.

**Three New A.R.A.'s.**—At a general assembly of Academicians and Associates, held on January 31st at the Royal Academy of Arts, Messrs. Arthur S. Cope, Alfred East (painters), and W. Goscombe John (sculptor) were elected Associates. Mons. Jules Breton was elected an honorary foreign Academician.

**A New Street for Cambridge** is proposed from the Great Bridge to Northampton Street. An excellent scheme has been prepared by Mr. Edwin Bays, architect, of London and Cambridge, by which persons in the neighbourhood of Bridge Street can obtain ready means of access to the Backs or Madingley Road. We hope the Corporation will adopt this scheme.

**Dangerous Structures.**—The following buildings or parts thereof have been reported to the Public Health Department as dangerous: 52, Fenchurch Street (stonework on third floor windows); 49, King William Street (studio on the top of the building); 30, Farringdon Street, and 16, Bear Alley, Farringdon Street (telephone pole on the roof); and 26, New Bridge Street (chimney-pot).

**The Improved Electric Glow Lamp Company Limited** were awarded a silver medal at the late Turin Exhibition for the excellence and efficiency of their lamps. The jury, in their report, stated that the gold medal would have been awarded to the Company if they had not been of the opinion that the price of the lamp, owing to the heavy duty, was too high for the Italian market.

**A new lighthouse** is to be erected at Barn Ness, on the Haddingtonshire coast, near Innerwick. The lighthouse is to stand 100ft. high, the district being a very low-lying one, and accommodation is also to be provided for lighthouse-keepers' houses and stores. The light will be a group, flashing three flashes in quick succession every half-minute. The beam of light of each of the flashes will be 78,000 candle-power.

**Water as a Motive Power.**—The Highland Water Power Company is applying to Parliament in the coming session for a Bill which has for its object the development of industries in the North of Scotland by means of water power. Another new enterprise in which water power is to be employed is the establishment of factories at Geneva for the production of carbide of calcium by utilising the enormous water powers of the Giffre River at Geneva.

**A Reconstructed Music Hall.**—The Bedford Music Hall, in High Street, Camden Town, has been entirely rebuilt during the past six months, and is to be opened very shortly. The auditorium has a depth of 65ft. and clear width of 56ft. There are no columns to obstruct the view of the stage, and some elegant features mark the Louis Quatorze embellishments. A sliding roof will assist ventilation, and the lighting is by electricity, with a reserve of both gas and oil.

**The Proposed Free Library at Wolverhampton**, which is to be erected as a memorial of the Diamond Jubilee, will cost about £14,000. The lowest tender for the work considerably exceeds the original estimate, and the subscriptions in hand or promised fall considerably short of the required amount. At a meeting of subscribers it was decided to make a further appeal for contributions. The accepted designs for the new building are by Mr. H. T. Hare, of London.

**Sculpture for South Africa.**—Mr. Tweed, the sculptor, is preparing a series of panels representing Major Wilson's last stand at the Shangani River. These are to be placed amid the ruins of Zimbabwe, in South Africa. The panels are 14ft. long by 7ft. high, and give a vivid representation of Wilson with his men leaving camp. Another important piece of work Mr. Tweed has in hand is a statue of Mr. Rhodes, 12ft. high, which is to be erected in Bulawayo.

**The Manchester Sewage Problem** seems now finally on its way towards solution. On last Wednesday the Manchester City Council authorised the Rivers Committee to take all necessary measures for preparing the plans and estimates necessary to effect the scheme recommended by the experts. The bacterial system is the scheme approved of, with double contact beds. The committee have secured the services of Mr. Baldwin Latham to prepare the plans and estimates.

**Haverfordwest Infirmary** has been reopened, after undergoing extensive alterations and additions. A storey has been added to the centre block of the building, and the extra space thus provided has been devoted to an operating theatre, which has a good overhead light, and is reached by a hospital lift; three bedrooms, a large sitting room, and two bathrooms, &c., for the staff. The new portion of the infirmary is estimated to have cost about £1000, and other alterations have cost another £200.

**A remarkable model railway** was exhibited at a recent conversation at the Royal Institution. By the system shown, it is claimed to be possible to attain a speed of 200 miles an hour. This is done by a system of inclined planes, which are automatically brought into existence by lifting up the rails by means of hydraulic pressure, as the carriage passes along them. The hydraulic pressure is applied by rams acting vertically up the pillars which support the carriage like a double pannier on a donkey's back is balanced on either side of the rail.

**The Expansive Force of Water.**—The pedestal of the memorial to the Emperor Alexander II., in the Kremlin, at Moscow, has become cracked. It appears that for convenience of polishing the outer face, the granite block was bored through its centre. Before the pedestal was placed in position, this hole was plugged up at the ends with cement, and filled in with hot sand in the middle of its length. The damp, however, appears to have penetrated in spite of these precautions, and with the first frost the expansive force of the freezing water cracked the huge mass from top to bottom. It is feared that the pedestal will have to be renewed at a cost of some £5000.

**A new picture**, intended for the decoration of the Royal Exchange, has been completed by Mr. Stanhope Forbes, A.R.A. The picture, which was commissioned by the Sun Insurance Company, represents the banks of the Thames during the Great Fire of London, when the riverside citizens moved their belongings to boats and barges, out of reach of the flames. It is an immense canvas, the lower part of which is crowded with figures of fugitive men and women, some already in the boats and others hastening down the stone steps leading to the water. High up on the steep bank are gabled houses, burning fiercely, and a great cloud of purplish smoke drifts across the river and obscures the sky.

**London Water Supply.**—In the course of his evidence before Lord Llandaff's Water Commission, Sir A. Binnie gave his opinion on the Lea as a source of supply. Looking to the future demand upon the East London Company and the probable increase of population, the Lea was, he said, for all practical purposes, exhausted. To make new reservoirs would be only waste of money. So near were they to the end of the possible supply from the Lea that it would be better to go to some other source of supply. He had come to the conclusion that in every dry season for many years to come the East London Company would have to be assisted by the Thames, even though there was no increase in the population. Colonel Lockwood, the Chairman of the East London Waterworks Company, in the course of his examination, admitted that his Company was unable to keep up a constant supply to its customers without calling upon other companies for assistance. But they were unwilling to sell their undertaking to the London County Council, whom they regarded as the Jack Cades of the nineteenth century.

## Correspondence.

### THE HULL LIBRARY COMPETITION: A WORD TO COMPETITORS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—The present mode of forwarding designs, without motto or distinguishing mark, has some disadvantages, as I have experienced in this instance. With my plans another competitor's report has been returned. They all bear the same number, put on by the same hand.

I have complained to the Town Clerk, but he repudiates all responsibility, and declares the alteration "was certainly not made by anyone in my office." It is too bad that competitors should be the victims of such carelessness. May I ask, with your kind indulgence, the competitor (who has mine) to exchange reports with me?—Yours faithfully,

A. H. GOODALL.

14, Market Street, Nottingham.

### LONDON DOORWAYS: A CORRECTION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—With reference to the article published under the heading of "London Doorways" in your issue of January 25th, I had thought that it was well known to most architectural students that Mr. Halsey Ricardo was the author of the very original design of the house in Great George Street, and not Mr. Leonard Stokes. If my memory serves me it is not a residential house as stated, but used as offices. With reference to the doorway in Great Titchfield Street, this is not an addition, but was built at the same time as the rest of the house, and took a rather more elaborate form than the rest of the building because the sculpture was a special donation to it. The architect is Mr. Beresford Pite.—Yours faithfully,

T. FRANK GREEN.

St. John's Wood, N.W.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I regret that I committed an inaccuracy in saying that I believed Mr. Leonard Stokes to be the architect of No. 8, Great George Street. I was aware that the house was let in offices, but did not mention the fact as I was dealing with the entrance doorway and not the internal arrangements.—Yours faithfully,

RUPERT C. AUSTIN.

London, W.C.

[Our thanks are due to Mr. Green and also to W. G. (London, S.W.) for kindly pointing out these inaccuracies. We much regret that they should have occurred.—ED.]

### THE REGISTRATION OF PLUMBERS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I think the present time is premature for the registration by law of men—connected with the building trade—to carry out any duties whatever relating to sanitation. I contend it would be far better that:

(a) Urban and Rural district councils throughout the United Kingdom shall be compelled to adopt the model by-laws or such like.

(b) All work in connection with the same should be enforced by law.

(c) The officers, for the future, of the said sanitary laws should be persons qualified by examination, also they should be solely appointed, and their salaries paid wholly by the Government.

Without the above (a, b, c) how can good results be expected in this age of competition?

—Yours truly,

S. F.

Crediton.

A Presbyterian Church to seat 700 is to be erected at Inverness. Plans of the edifice were prepared by Messrs. Ross and Macbeth, architects, Inverness. At the back will be situated a vestry and a small hall.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

February 8th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

### An Ugly Bridge.

REFERENCE has been made more than once in our columns to the efforts that are being made by architects to secure a revision of the architectural treatment of the new Vauxhall Bridge, which, if erected according to the design that has been accepted by the London County Council, will be an offence to everyone of any artistic sensibility. Mr. H. Heathcote Statham, in a letter to the "Times," essays the difficult task of arousing the interest of the general public in the question. He points out how differently these things are done in France. The French Government are now constructing a new bridge over the Seine at the Champs Elysées, the "Pont Alexandre III." The engineering structure is by two engineers of the "Pont et Chaussées" service, M. Résal and M. Alby; but with them are associated two well-known and accomplished architects, M. Victor Cousin and M. Cassien-Bernard, who are jointly responsible with the engineers for the general design of the bridge and jointly credited with it. The sculptural decorations and its approaches are to be executed by several of the most eminent French sculptors of the day; and even such a minor detail as the design for the lamp standards has been entrusted to one of the ablest of the younger French sculptors, M. Gauquié, whose "Clairon Monument" formed a central object in last year's Salon. That is what they do in Paris. In London, says Mr. Statham, the designs are left in the hands of an engineer who has never studied design in the architectural sense at all, and of any nameless person whom he may hire to do hack-work on the design.

Sir A. Binnie As might be supposed, Sir A. Binnie is not quite of Mr. Statham's opinion. In fact, he went so far as to declare, in reply to a "Pall Mall Gazette" interviewer, that the new bridge will be one of the handsomest over the river. It seems to have been by a gradual process of evolution that the present design came into being. Sir A. Binnie stated that when the construction of the bridge was first resolved upon the Committee of the Institute of British Architects submitted to the committee of the County Council certain suggestions and sketch designs. The engineer was then instructed to prepare designs. Before that he had already prepared about a dozen. At first it was intended to build a steel bridge, with masonry piers, but the consensus of opinion in the Council was in favour of a masonry design, so Sir A. Binnie went forth to study the best masonry bridges on the Continent. He came home primed with ideas, and prepared his design, which he then submitted to Messrs. Waterhouse and Monckton, representing the Art Committee of the R.I.B.A. These gentlemen, said Sir Alexander, were exceedingly pleased with the design, though they made certain suggestions in regard to it.

The suggestions were carried out in part—not entirely—but they related to matters of quite minor importance. It is probably here that the difference between Sir A. Binnie and his critics comes in. From the further remarks he made on matters of detail, it seems not unlikely that some of the points the County Council's engineer considers to be mere matters of taste, and of very little consequence are just those which his architectural critics regard as of vital importance.

Sir Edward J. Poynter's Opinion.

THE President of the Royal Academy says ditto to Mr. Statham. Writing in the "Times," he expresses the pleasure with which he has read Mr. Statham's letter. "What he says," writes Sir Edward Poynter, "has wanted saying for a long time. Of all the forms of folly which desolate our great City the hopeless attempt to make a work of engineering pose as architecture has, perhaps, most to answer for. If there is a genuine desire to make the bridge a handsome structure let money be spent on it, and let it be an architectural work, with an engineer, if necessary, to see to the solidity of its structure and foundations, or let us make no pretence in the matter, and resign ourselves to the plain hideousness of the girder or iron tube on the cheap; but I decline to believe that we are so poor as to make this a necessity."

A Colossal Monument. THE torso, of which an illustration is here given, is a study for the colossal figure of the Crucified Christ, which Messrs. Harry Hems and Sons have been commissioned by Lord Aldenham of Aldenham to execute for the high altar screen at St. Albans Cathedral. The stone from which the figure is to be

MODEL OF TORSO FOR HIGH ALTAR SCREEN ST. ALBANS ABBEY.

carved is a huge block of yellow magnesium limestone, raised in Messrs. Lindley and Sons' quarries at Mansfield, weighing 9 tons 18 cwt., and containing 165 cubic feet. This is the largest stone ever delivered in Exeter; by some it is believed to be the largest stone ever quarried in England.

### In Praise of British Art.

PROFESSOR VON TSCHUDI, Director of the National Gallery in Berlin, has just been paying this country a handsome tribute by talking of "the present overwhelming influence of England upon the development of Continental Art." Professor von Tschudi ascribes the uninterrupted continuity of the growth of taste and Art in Great Britain to the fact that our social distinctions have not experienced the breakdown and chaos created by the French Revolution. Artists in this country have always had private patrons of wealth and discrimination to encourage them to the highest efforts; and with the help of the patron painters have painted their best. Professor von Tschudi does not believe in the heterogeneous mass called "the public." The heterogeneous mass has, since the French Revolution, influenced Art in France; but in England "the clergy and polite society have, in a sense, been the only begetters of the artist and his work." Whatever the degree of truth there may be in these theories, it is gratifying to our national pride to find that so eminent a foreign critic is so strong an admirer of the British school.

### Wanted an Architect.

As long ago as last October the London County Council issued advertisements for the appointment of architect to the Council, the position being rendered vacant by the retirement of Mr. Blashill, who has passed the age limit. None of the candidates who then applied had, in the opinion of the General Purposes Committee, the necessary qualifications for so important a position; and, as we stated last week, the Council had to ask Mr. Blashill to retain his position for a while, which that gentleman consented to do. The Council has now decided, on the recommendation of the General Purposes Committee, again to issue advertisements for the appointment, and to increase the salary attached to the office from £1500 to £2000 a year. It is hoped by thus raising the salary to receive applications from gentlemen in the architectural profession from among whom the committee may feel justified in making a selection. The salary is to carry with it no pension rights. The enhanced salary does not seem extravagant seeing that during the last ten years the work of the architect's department has much increased.

### Public v. Private Slaughter-Houses.

THE London County Council has declined to undertake the establishment of municipal slaughter-houses, as recommended by the Public Health Committee. At the meeting of the Council on January 31st the question was introduced by a resolution submitted by the Public Health Committee that, as a first step towards ensuring the proper inspection of meat, private slaughter-houses should cease to exist in London, and that butchers should in substitution be afforded such facilities as are necessary for the killing of animals in public slaughter-houses to be erected by the Council. The question was scarcely discussed on its merits; various side issues intervened, and the Council shelved the whole matter by the simple expedient of deciding to proceed with the "next business." Whereat the butchers rejoice, and sanitarians lament.

### Abattoirs on the Continent.

It is an open question whether the establishment of municipal abattoirs would be inimical to the interests of the butchers. But looking at the matter from the point of view of the public health and convenience, it is to be regretted that this country, which has so often taken the lead in sanitary matters, should in this matter be content to lag behind most Continental nations. A series of articles in this journal recently described the public abattoirs of Paris, and all over the Continent the system is becoming more and more general. Mr. Thomas Blashill, the architect to the London County Council, has recently visited a number of municipal slaughterhouses in Germany, and in an interesting report to the Council he points out the admirable character

of the arrangements that are made for health and cleanliness. It is significant that in many places the butchers themselves prefer the public system, as it saves them trouble and expense.

### "Improvements" in Florence.

A NUMBER of English artists and people of artistic sensibilities have been endeavouring to check the wholesale destruction of ancient buildings in Florence. Their action in the matter has won the thanks of the Italian Society for the Protection of Ancient Florence, but it has drawn criticism from others, on the ground that those who live in England have no right to interfere with other countries, while they allow similar acts of vandalism to be perpetrated at home. To this *tu quoque* Sir Edward J. Poynter replies in a long and interesting letter in last Saturday's Times. He points out the wide difference in their relation to Art between two such cities as London and Florence. Moreover he contends that he and his friends would gladly stop acts of vandalism in London if they could.

### The Home of Art.

SIR EDWARD writes of the lovely city on the Arno with the enthusiasm which she inspires in all artistic souls: "Florence," he says, "has until recently existed almost intact from the times when the work of the artisan and builder took everywhere and instinctively a more or less artistic form, but nowhere with such high and precious distinction as in this favoured city; when every street had the dignity and even grandeur that comes of a sense of proportion and style, and there was hardly a house of importance that was not adorned with some distinctive and characteristic feature—often a gem of decorative workmanship from the studio of a great artist, and such as only a Florentine of the Renaissance could produce; so that the whole city bore the impress of their serious Art. No pains or expense were too great for the citizens of Florence to lavish on their beloved city. And Florence is not only a gem in itself, but with its limpid atmosphere and its exquisite surroundings—its mountains, its villas, and its gardens—it is in a setting unsurpassed by any city of the world. It is hard to say whether to wander through its streets and public places, among its palaces and churches, or to look down from the hills around on its domes and towers, its river and bridges (its unique Ponte Vecchio), is the greater exaltation to the spirit. No one need wonder that with these attractions Florence should be a centre of such interest to the cultivated mind of whatever nationality that a cry of protest arises against the unskilled and thoughtless meddling which, in the name of science and progress, would deprive it of its unique character."

### What the New Street will do.

AN interesting article in this month's "Contemporary Review" deals with the subject of London Improvements. The writer is Mr. Shaw-Lefevre, L.C.C. Speaking of the new street which the County Council are to construct between Holborn and the Strand, the writer says:—"There can be no doubt that the new street will be one of the greatest improvements ever effected in London. It will make a splendid new artery between the North and South of London, and the wide sweep of the crescent will produce a most striking architectural effect. The widening of the Strand for some distance to 120ft. will also be a great feature. The Church of St. Mary-le-Strand, with its exquisite classical steeple, will stand out in the centre of the widened street, making a dignified approach to the City. If I am right in supposing that most valuable buildings will be erected on the new frontages, it is clear that the scheme, both in demolition and building, will afford employment for labour on a very large scale. The labouring people will also be greatly benefited by the clearing away of the unsanitary slums through which the new street will pass, and by the erection of new houses for them on the best sanitary principles at no great distance."

### Moving Pavements.

THE latest thing in locomotion is the moving pavement. This is not a rival of the bicycle or the motor-car, but if you are content to travel at the rate of three or four miles an hour, the moving pavement furnishes an easy and agreeable means of transport. Upon a platform raised somewhat above the street level two wooden tracks run side by side, one at the rate of three, the other at the rate of five miles an hour. The paths themselves are built of planks of short length, so ingeniously jointed together as to enable a sharp curve to be taken; and these planks rest upon iron rails, to which motion is imparted by revolving wheels below. The system was tried last week at St. Ouen, on the Seine, and it is to be employed at the Paris Exhibition next year to transport visitors from point to point.

### A Judge's Opinion of Builders.

JUDGE LUSHINGTON's experiences of builders have not been of the happiest. But that fact hardly justifies the sweeping generalisation with which, if he is correctly reported, he recently condemned the whole trade. The case was that of Davis v. Day, in which an architect sued a builder for slander. Judge Lushington said "the case was a most sordid one. Perhaps his view of matters might be regarded as a hard one, but he did not think builders should be considered by ordinary standards. He did not think he ever sat at that court without having malpractices of builders brought before him." Perhaps a wider acquaintance with builders would convince Judge Lushington that his remark about "ordinary standards" is as unfair as it is unjudicial.

### Street Advertisements.

WE refer elsewhere to the architects' memorial addressed to the London County Council on the subject of illuminated advertisements. This has induced a correspondent of the Times, who writes from Lincoln's Inn, to call attention to another favourite method of disfiguring our streets; this is the practice of advertising by means of huge gilt letters hung across the front of buildings without regard to architectural lines. "These abominations," writes the correspondent, "the worst of which are written in text hand with a French flourish sprawling diagonally over the façade, are an eyesore at all times, and go far to mar the pleasure of a walk in the streets of London. If the County Council can be induced seriously to take up this matter they will earn our gratitude no less than by abolishing or mitigating the evil of illuminated signs." So they would; but not the gratitude of the tradesman, who feels that he must advertise or perish.

### The L.S.B. and its Architect.

A QUESTION of some interest to architects is at present engaging the attention of the London School Board. The Works Committee of the Board has called on Mr. H. Bradfield, assistant architect for repairs, to send in his resignation. This he has refused to do, and the Board, after discussing the matter in full conclave, has declined to enforce the dismissal, and referred the matter back to the Committee for further consideration. The circumstances which led to this rather curious position of affairs are these: Five years ago Mr. Bradfield reconstructed the drainage at the Boards' Brentwood Industrial School. Last summer an outbreak of illness occurred at the school, and Mr. Bradfield was sent down to report on the drainage and sanitary arrangements. He reported that no alterations were required. The medical officer was not satisfied, and therefore the Board sent down Mr. Peacock, their sanitary surveyor, who reported serious defects in the drainage. Mr. G. A. P. Cuxson, F.S.I., A.R.I.B.A., who was called in to make an independent inquiry, confirmed Mr. Peacock's report; hence the Works Committee's demand for Mr. Bradfield's resignation. That gentleman, in support of his refusal to resign, produced further expert evidence, viz., that of Professor Corfield, who stated that the drainage and sanitary arrangements had been well planned and carried out.

## Professional Practice.

**Aberdeen.**—Plans of a large house to be erected presently at Kildrummy for Mr. James Ogston, of Norwood and Kildrummy, have been prepared by Mr. A. Marshall Mackenzie, A.R.S.A., architect, Aberdeen. The new mansion is to be built of cream-coloured freestone, quarried on the spot. It will be in the Tudor style of Architecture, and in several respects will thus harmonise with the old castle, near the ruins of which it is to be built. The new house will have mullioned and transomed windows, numerous gables and projecting oriel windows, and lofty chimney stalks. The whole building is to be lighted by electricity, and a dam will be formed to intercept water as a motive power for driving the dynamos. New stabling also will be erected, as well as a new lodge at the entrance-gate.

**Blackhead.**—A new lighthouse and fog-signal station is being erected by the Northern Lighthouse Commissioners at Blackhead, about three miles north of Portpatrick Harbour, on the Wigtownshire coast of the Irish Channel, and it is now in an advanced stage, having reached a height of 42ft., to which has still to be added 3ft., of granite and the lantern. It is built with blue whinstone, and the facings are of grey granite and red sandstone. The flat iron roofs of the various buildings will be covered with Val de Travers and concrete. Mr. William Waddell, has charge of the contract for Messrs. John Adam and Son, of Glasgow.

**Bristol.**—The Crown Inn, Staple Hill, of which a perspective view and plan are here given, is to be erected at Staple Hill, near Bristol. The materials used will be Cattybrook red facings and Ham Hill stone dressings on ground floor, with tile hanging plaster and timber to the upper floor; roofs to be covered with red Broseley tiles. The bar and fittings throughout will be of pitch pine. Messrs. Walter S. Paul and James, of Bristol, A.R.I.B.A., are the architects.

**Dublin.**—New National Schools, to accommodate 500 scholars, are being erected in Lower Sherrard Street. The new building will consist of a single story, so that all the rooms are on one floor. The walls are constructed of breeze concrete; the dressings of the openings and the plinth, course-quoins, &c., are of brick, red facing brick being used on all exposed portions. The intervening space will be covered with pebble dashing, which will form an agreeable contrast to the brickwork surrounding it. Internally the roofs will be open to half their height, the timber principals being exposed and stained. The lower part of the walls will be lined with wainscot, the upper portion being plastered. Due provision has been made for efficient sanitary fittings and for ventilation and heating. An ornamental turret will surmount the main roof over the centre of the building; this will serve as an outlet ventilator for extracting the vitiated air from the various class-rooms. The contractor for the whole work is Mr. E. Farquharson, of Jones's Road, and the architect Mr. W. M. Mitchell, E.H.A., of Leinster Street, under whose superintendence the building is being erected.

**London, S.W.**—The London County Council have given their consent to the formation of a new street, 50ft. wide, and nearly a quarter of a mile long, starting close to St. Paul's Schools at West Kensington, and terminating opposite the house of the late Sir E. Burne-Jones. The street will be known as Fitzgeorge Avenue, and will be occupied on both sides of its entire length by blocks of residential flats. The contract for the whole operation is being carried out by Mr. Henry Lovatt, from the designs of Mr. Delissa Joseph, F.R.I.B.A.

**Westminster.**—The Institution of Mechanical Engineers' new building at Storey's Gate, Westminster, will be opened to-morrow

for a meeting of the Institution, but we understand the formal opening will not take place for some time. It adjoins the new premises of Her Majesty's Office of Works, which it rather overshadows by its wide and lofty portico. The building is in the Renaissance style, and the architect is Mr. Basil Slade. It has taken about three years to erect, and is reported to have cost £30,000. It stands just inside St. James's Park, on a grand open site, and is within a few hundred yards of the Institution of Civil Engineers. The exterior is of dressed Portland stone and red brick. Over the main entrance is a handsome portico with Corinthian columns. The door is approached by a short flight of steps. The interior is lavishly adorned, and supplied with modern comforts. The chief wood employed is Austrian oak. The tea and smoking room is very ornate, marbles being displayed in the greatest profusion. The most noticeable wall decoration is Mexican onyx panels. The pilasters are of coloured marble with caps and bases of statuary marble. A few feet above the level of the street is a spacious lecture theatre, which occupies the height of two floors. A grand oak staircase, with elaborately carved balusters, Persian-red walls, and a dado, leads to

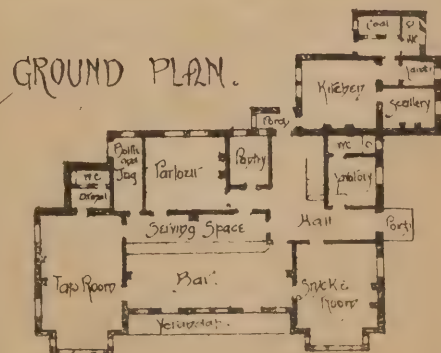

the library, the secretary's office, and the reading room. The library, which occupies almost the whole of one floor, and is of fine proportions, will contain unrivalled stores of publications dealing with mechanical engineering. There are the latest mechanical devices in the building, electric clocks, electric lights, and an electric lift, and the newest apparatus for bringing in pure air. There is also a large room for the storage of past and present records. Throughout the whole building is a perfect arrangement of voice tubes and telephones, securing communication between every part of it, and there are also separate lifts for passengers and goods, and one from the refreshment department to the several floors. All the lighting and power used on the premises is electrical. The Plenum system of ventilation has been adopted. All the air will be drawn from St. James's Park, and after being washed by passing through mats over which a constant stream of water is kept flowing, and warmed over a radiation coil, it will be distributed throughout the building. Powerful electric fans suck in the air and drive it out when vitiated, and these are so arranged that the whole atmosphere of the various rooms can be changed every few minutes. Altogether the new house of the Institution of Mechanical Engineers will be one of the most comfortable and completely equipped of similar buildings.

**Wolverhampton.**—The Building Committee of the new Wesleyan Chapel, Darlington Street, Wolverhampton, have selected the plans of Mr. Arthur Marshall, of Nottingham, who is also the architect of the new Wolverhampton Workhouse. The sitting accommodation will be 1250. The total cost is £9000.

## Views and Reviews.

### FOR THE ARTIST AND CRAFTSMAN.

In the February number of the "Architectural Review" Mr. Philip A. Robson writes of St. David's in a manner that will probably make many of his readers determine to spend a summer holiday in this secluded spot, which has the happy and unique distinction of being a cathedral city that has no railway station. Mr. Walter Millard, in a well-illustrated article, gives the reader a good idea of the character and scope of the work of Gilbert Scott the younger. Mr. H. B. Walters brings to a conclusion his interesting studies of the Architectural remains of Cyprus, and

THE CROWN INN, STAPLE HILL, NEAR BRISTOL,  
WALTER S. PAUL AND JAMES, ARCHITECTS.

Mr. A. E. Street contributes a well-written appreciation of George Price Boyce. The curiously interesting question of the authorship of "John Thorpe's Book of Drawings," now in the Soane Museum, is discussed with much acumen by Mr. J. A. Gotch, who comes to no uncertain conclusion; if the draughtsman was not John Thorpe, he was—well, another man of the same name. The magazine is produced in the sumptuous style its readers have learned to expect, but perhaps the feature which many will chiefly appreciate is the photogravure plate illustrating David

Street; this forms the fifth of the series of drawings of "Disappearing London"—a series which promises to be not merely of passing interest, but of permanent value.

### A CONTRIBUTION TO CHAOS.

A volume from the pen of Count Leo Tolstoy, the Russian philosopher and novelist, will necessarily attract a wide interest; and his latest book, "What is Art?" will win an especial attention both from the challenge indicated in its daring title, and from the fact that the author has elsewhere told us it must, perforce, be the last considerable work to which destiny has ordained he shall ever set his hand. The scope of this book prompts the surmise that the author would consider it to be not only his last but his greatest achievement. It is likely, however, that posterity may decide otherwise. Leo Tolstoy has from time to time brought under the eyes of the world many of its gravest social problems and its most incomprehensible enigmas, illumined and transformed by the searching light of that wide-reaching generous humanity which constitutes the central impulse of all his teachings, but these principles cannot reveal to us the true path through those realms of controversy in which the enquirer after the abstract nature of Art so commonly finds himself involved.

That the attitude of antagonism to the generally accepted tenets of Art which is promised by the title of the book, is indeed fulfilled in its pages, but alas, not only must the principles and the conclusions deduced appear throughout wholly repugnant to the executant artist of all denominations, both individually and in bulk, but they constitute a daring and vigorous ratification of precisely those two most intolerable beliefs of the untutored and unthinking critic, who holds as good Art just only that thing which may hap to touch or vibrate his own sympathies, who would estimate all Art by the test of his own moral bias, setting the ethical value of a picture or a poem before the æsthetic; and who would, in short, acknowledge nothing to be Art which does not awaken some tender memory or illustrate in some way the articles of his religious belief. There is not surely a more pernicious, as there is no commoner, fallacy than this one. Here is an analogy that will point the absurdity. Upon the same principle of reasoning any one would be entitled to insist that an apple was not an apple because he did not like the taste of it, or because he believed it wrong to eat of the fruit.

It is perhaps true to say, however, that Tolstoy's book hardly lends itself to so rude and summary a method of dismissal as this. There is scope for speculation of an absorbing and entrancing interest in the consideration of the question how far, and to what degree, and latent impulse of worship is essential to great Art. None can seriously deny the chastening and perfecting influence of this impulse upon Art, and Count Tolstoy has much to say in amplification and illustration of it; but he will be considered by most people who are familiar with this idea to have pressed his conclusions beyond the limits which unprejudiced discretion would impose. In a grand enthusiasm he has been led to identify all worship too closely with Christianity. Thus, while he makes use of the word "worship" with the same wide significance which we find accorded to it in the pages of Mr. Ruskin; instancing it in a particular picture of a lifeboat hastening in a heavy storm to the relief of a wrecked steamer, and in the pictures of Millet and others, "which represent the hard-working peasant with respect and love," his warped point of view fails to perceive this same quality in the melting, chastening beauty, of the Greek sculptures. This is how Count Tolstoy would have us regard the ancient Greeks: "A small semi-savage slave holding people who lived 2000 years ago, who imitated the human figure extremely well, and erected buildings pleasant to look at," while elsewhere he refers to the "rude, savage, and for us often meaningless works of ancient Greeks." This method recalls passages from the writings of Mr. Max.

Nordau. But Count Tolstoy has many similar heresies, notably upon the subject of music, to offer us in establishment of his central texts, which may be summarised thus in his own words: "Great works of Art are only great because they are accessible and comprehensible to everyone," and "A good and lofty work of Art may be incomprehensible, but not to simple, unperturbed peasant labourers (all that is highest is understood by them)—it may be, and often is, unintelligible to erudite, perverted people, destitute of religion."

"What is Art?" By Leo Tolstoy. Translated from the Russian by Aylmer Maude, with an English preface by the author. Brotherhood Publishing Company.

## Under Discussion.

### EDINBURGH ARCHITECTURAL SOCIETY.

Wednesday, the 1st inst., was the opening night of the session. Mr. A. Lorne Campbell, the new president, opened the meeting with a short address. In reviewing the very healthy state of the Society, he touched on the recent successes in the R.I.B.A. Scholarship Competitions attained by members and recent winners in the Society's measured work and prize competitions. Mr. W. A. Mellon had won the Soane, Mr. J. Hervey Rutherford the Pugin, and Mr. J. T. Stewart the Owen-Jones, while Mr. R. Traquair had been third in the Pugin. Mr. J. Edwin Forbes then read a paper on the Abbeys of the Stewartry of Kirkcudbright, which touched on Glenluce, Sweetheart, and Dundrennan Abbeys, Includin College, and Caerlaverock Castle. The paper was profusely illustrated with lantern slides, in connection with which the Society's new plant made a successful debut.

### MINERAL OILS.

At the monthly meeting of the Leeds Association of Engineers, Mr. B. Holgate, F.G.S., gave a paper on "Mineral Oils." What are known as mineral oils, he said, were really of animal or vegetable origin. This was demonstrated by the hydro-carbons in their composition. From time immemorial paraffin had been known. It was found in every quarter of the globe, and was not confined to any particular strata of the earth's surface. In 1859, when this oil was first struck in Pennsylvania, it first became an article of commerce. Mr. Holgate described the various processes by which foreign ingredients are eliminated, and the methods of distillation and testing. If intended for lubrication, mineral oil should always be blended with animal or vegetable oil, the proportion and quality of each depending on the kind of machinery lubricated. Referring to the Act of Parliament by which the flash point of lamp oil was raised, the author said that, however high the flash point, without proper care oil lamps would necessarily be a source of danger. To ensure safety, it was essential to have the proper size and quality of wick.—A discussion followed.

### BUILDING DIFFICULTIES.

The usual meeting of the Glasgow and West of Scotland Technical College Architectural Craftsman Society was held at the rooms 204, George Street, on Friday 3rd inst., Mr. W. H. Baxter, vice-president, in the chair. There was a good attendance. A discussion was opened by Mr. Isaac Low on "Building Deficiencies." The author treated the subject principally from a craftsman's point of view, and in a manner to raise discussion, his headings and remarks being of such a practical nature as to call forth the concurrence and criticism of the other members, who, by each taking up the points which applied particularly to his vocation, whether as architect, measurer, clerk of works, or joiner, enabled the members to consider the question from many standpoints, and so get the greatest practical value from this exchange of ideas. Among the many heads for discussion given by Mr. Low may be mentioned—insufficiency of plans, defects in

design, an architect's responsibility, cheap work, technical training of all craftsmen as well as architects, impossible mouldings, specifications, &c. The brisk continuance of the discussion taken part in by many of the members was ample evidence of the good selection, and the engrossing interest, of the points so carefully given by Mr. Low.

### THE GRANITE OF DARTMOOR.

At Torquay Natural History Society on January 30th Mr. A. Somervail lectured on Dartmoor granite. Geologists at one time believed that granite was the oldest of all rocks, and that it was the foundation upon which all other rocks rested. But this idea was no longer entertained, and it was known that granite did not necessarily form the foundation of other rocks at all. It was of all ages, some being very ancient, and some very modern. In this country there were granites as old as the earliest rocks, and some comparatively new. Dartmoor granite was an igneous rock of plutonic origin that had been forced to the surface in a molten state, and had gradually cooled to its present solid condition. Chemical analysis showed it was mainly composed of silica, no less than 69.64 per cent. of it being of that substance. The remainder was made up as follows:—Alumina, 17.35 per cent.; iron, 1.73; calcium, 1.40; magnesia, 0.21; potash, 4.08; soda, 3.51; water, 1.09. Its mineral composition was:—Felspar, 60 per cent.; quartz, 25 per cent.; schorl, 10 per cent.; and mica, 5 per cent. There were many varieties of granite on Dartmoor both as regarded mineral composition and colour. A large part of the lecture was devoted to consideration of the age of the Dartmoor granite. This, the lecturer considered, was somewhere between that of the Devonian and Culm formations and that of the Permian group, although it could only be approximately fixed. The Dartmoor granite had always been a problem to geologists, and it so remained in many respects.

### ARCHITECTURAL PHOTOGRAPHY.

An illustrated lecture on "Architectural Photography," the joint production of Messrs. Edward G. and Fred E. Turney and E. I. Grove, was given recently at the Devonport Camera Club.—Mr. E. G. Turney read the lecture.—At the outset it was insisted that interiors are not more difficult to photograph than the general run of subjects, provided certain rules are observed. Backed or other antihalation plates are an absolute necessity. The camera should have a swing back fitted with a spirit level, so that it may be adjusted in a perfectly vertical position. Nothing looks worse than columns, which should be parallel, converging either at the tops or at the bases. If, however, columns do not appear quite vertical, the fault must not of necessity be attributed to the camera, for in many cathedrals, especially at Salisbury, the columns have been thrust out of the perpendicular by the weight of roofs and towers. A rapid rectilinear lens is almost, but not quite, a necessity. If a single lens be used, it should not include too wide an angle, otherwise curvilinear distortion would result. On the question of exposure it was suggested that the average exposure in fairly lighted cathedral interiors when using a plate of medium rapidity, and an aperture of F 20 is about twenty seconds. It is better to err, if at all, on the side of over-exposure. An under-exposed negative of an interior is an abomination. If visitors stand for any length of time in the view, the best plan is to hold the focussing cloth or a hat close to the lens, but not touching it. Capping the lens or closing the shutter might cause a double image. The slipping of the tripod on polished stone floors is easily prevented by the use of pieces of cork or india-rubber on the spikes. The plates used by the lecturers were Castle, Paget XXX., and Ilford special rapid. The results obtained on the latter were generally such as to encourage the use of fast plates for interior work, as the saving of one-third the exposure is of considerable value if many views are taken. The lecture was admirably illustrated with about ninety lantern slides.

## MEDIÆVAL CHURCHES.

The fourth sessional meeting of the East of Scotland Engineering Association was held last Wednesday at 5, St. Andrew Square, Edinburgh. Mr. J. D. Gibson was in the chair. The Chairman referred to the appointment of Mr. John Young, president of the Association, as borough surveyor for the town of Ayr, and expressed the congratulations of the Association together with their regret at losing Mr. Young. Mr. H. F. Kerr, A.R.I.B.A., then delivered a lecture on "Some Great Mediæval Churches and their Construction." He said the great churches of mediæval times had been admired both by the practical and the artistic mind. The former had room to ponder the scientific skill with which these early builders covered vast spaces with great vaults, the whole supported on a minimum of solid piers; the artist revelled in the equally marvellous manner in which every feature—and every feature was a constructional item—was treated so as to fully satisfy the imagination; the result being universal admiration and respect. The division of these churches, almost invariably cruciform in plan,

into aisles covered with vaults was fully entered into, and the difficulties met with in early vaults of barrel pattern, and the solutions of these were pointed out. The aim of the early builders was to light the nave by windows above the great arcade and beneath the stone ceiling, without rendering precarious the stability of the fabric. The development to this end was traced from barrel vault, through ground vault, to rib vault and pointed vault. The construction, the features, and the decoration of these buildings were fully indicated by chronological diagrams and views, about eighty lantern slides being shown.

## THE BACTERIAL TREATMENT OF SEWAGE.

The third of the Cantor lectures on the bacterial treatment of sewage was delivered by Dr. Rideal at the Society of Arts on Jan. 30th. The lecturer devoted much attention to the peculiarities and mode of life of the various organisms, anærobic and ærobic, which under given conditions carry out the

complicated methods of sewage purification. These methods, Dr. Rideal pointed out, depend on an orderly natural sequence in the bacterial changes, and he noted that any mixing or confusing in the orderly artificial interference, or any attempt to work distinct actions simultaneously in the same receptacle, would lead to uncertainty in the results. The one-acre filter at Barking was instanced as only one part of a process which includes also the cost and complication of a preliminary precipitation and a subsequent transport of the sludge to the mouth of the Thames. The natural process now suggested, on the other hand, consisted, first, in a liquefaction of the insoluble matter, and a modification of the dissolved matter in a closed space, mainly by anærobic bacteria; secondly, in an oxidation by land, or more cheaply and regularly, by a smaller bacterial area like a coke or ballast bed. After giving instances of the importance of the process of hydrolysis or liquefaction without air, Dr. Rideal explained the difference between the two classes of microbes. He then discussed the chemical changes, gaseous and otherwise, occurring in a septic tank.

## COMING EVENTS.

## WEDNESDAY, FEB. 8.

Edinburgh Architectural Association.—T. A. Croall, F.S.A., Scot., on "Some Words about Edinburgh Architecture." 8 p.m.

Liverpool Engineering Society.—W. H. Preece, C.B., F.R.S., on "Electricity at the General Post Office." 8 p.m.

St. Paul's Ecclesiastical Society (Chapter House, St. Paul's).—Philip M. Johnson on "Low Side Windows." Illustrated by Lantern Views. 7.30 p.m.

Sanitary Institute.—Discussion on "The Supply of Water to London by the Welsh Scheme." Opened by R. E. Middleton, M.I.C.E., M.I.M.E. Sir Douglas Galton in the chair. 8 p.m.

Society of Arts.—James Swinburne on "Nernet's Electric Lamp." 8 p.m. Wilton P. Rux on "Leadless Glasses." 8.30 p.m.

## THURSDAY, FEB. 9.

Institute of Electrical Engineers.—Continued discussion on: (1) "Rules for the Regulation of the Wiring of Premises for Connection to Public Supply Mains," by J. Pigg. (2) "The Regulation of Wiring Rules," by C. H. Worthingham. (3) "The Institution Wiring Rules," by R. E. Crompton. If time permits, a paper will be read on "Electric Traction by Surface Contracts," by Miles Walker. 8 p.m.

Institution of Mechanical Engineers.—Annual General Meeting (1). Fifth Report of the Alloys Research Committee: Steel. By Sir William C. Roberts-Austin, K.C.B., D.C.L., F.R.S. 7.30 p.m.

Society of Antiquaries.—Meeting at 8.30 p.m.

Society of Arts.—Meeting of Indian Section at 4.30 p.m.

## FRIDAY, FEB. 10.

Birmingham Architectural Association.—Beresford Pite, F.R.I.B.A., on "Ancient and Modern Buildings in Palestine."

Institution of Junior Engineers.—Joint Meeting with the Architectural Discussion Section, at the Westminster Palace Hotel, Victoria Street. J. H. Pearson on "Factory Design." 8 p.m.

Institution of Mechanical Engineers.—Annual General Meeting (2). William Powrie on "Machinery for Book and General Printing." Harry G. V. Oldham on "Evaporative Condensers." 7.30 p.m.

Royal Institution.—Professor H. S. Hele-Shaw on "The Motion of a Perfect Liquid," illustrated by experiments. 9 p.m.

## SATURDAY, FEB. 11.

Edinburgh Architectural Association.—Visit to Cable Power Station, Tollcross.

London and Provincial Builders' Foremen's Association.—Annual Dinner, Anderson's Hotel, Fleet-street. 6.30 p.m.

Royal Institution.—The Right Hon. Lord Rayleigh on "The Mechanical Properties of Bodies." I. 3 p.m.

South Kensington Museum (Lecture Theatre).—J. H. Pollen, M.A., on "Furniture." I. 3.30 p.m.

## MONDAY, FEB. 13.

Bristol Society of Architects.—Arthur Lee, on "Marble Decoration."

Carpenter's Hall Lectures.—Basil Mott, on "Building an Underground Railway." Sir Arthur Arnold in the chair. 8 p.m.

Society of Arts.—Ordinary Meeting at 8 p.m.

## TUESDAY, FEB. 14.

Auctioneers' Institute of the United Kingdom.—E. J. Vaughan on "Ejectment of Tenants without Legal Process." 7.45 p.m.

Perth Architectural Association.—William Watson on "The Progress of Sanitary Science." 8 p.m.

Shalford Society of Architects and Surveyors.—P. Marshall, F.S.I., on "Surveying."

## WEDNESDAY, FEB. 15.

Edinburgh Architectural Association.—J. Connell on "Some Legal Points affecting Architects." 8 p.m.

Manchester Arts and Crafts Lectures.—H. A. Prothero, M.A., F.R.I.B.A., on "English Church Architecture." 8 p.m.

Society of Arts. Ordinary Meeting at 8 p.m.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BOLTON.—Accepted for the execution of sewerage works (two contracts) for the Little Hulton Urban District Council. Mr. C. C. Hooley, C.E., Council's Offices, Little Hulton.

No. 1.—J. and M. Hawley, Stoneclough. £2,312 12 1

No. 2.—W. Snape and Sons, Eccles. £286 5

HUDDERSFIELD.—For the erection of twelve houses, Calmads, for the Meltham Industrial Society Limited. Mr. J. Berry, architect, 9, Queen-street, Huddersfield:—

Masonry.—James Earnshaw & Son, Meltham

Joinery.—Garlick Bros., Meltham

Plumbing.—John W. Kaye, Meltham

Plastering and Staining.—James Wilkinson. £2,830

Painting.—Joseph Preston & Sons, Meltham

Concreting.—John Cooke, Little Royd

LEYTON.—For electric wire factory, Leyton. Mr. W. M. Hudson, architect:—

W. Shurmur ... £10,475 H. Brown ... £9,979

F. and F. H. Higgs ... 10,285 S. J. Scott ... 3,868

S. Goodall ... 10,147

LITTLE ILFORD (Essex).—For the erection of school buildings, &c., Bessborough-road, for the School Board. Mr. S. Jackson, architect, 65, Fenchurch-street, London, E.C.

Quantities by Mr. Walter Lawrence, 13, Hart-street, Bloomsbury, W.C.:

W. J. Maddison ... £24,807 Harris and Wardrop £21,295

Shelbourne and Co. ... 24,683 W. Shurmur ... 21,062

G. Sharpe ... 23,490 Perry and Co. ... 20,925

F. Britton ... 22,275 Gregar & Son, Strat-

Chessum and Sons ... 21,997 ford, E.C.\* ... 20,336

\* Provisionally accepted, but subject to approval of Education Department.

LONDON.—For the supply of gas engines, &c., required in connection with the electric lighting of the Victoria Embankment, for the London County Council:—

J. Taylor & Sons, Ltd. £3,457 Premier Gas Engine

Fielding & Platt, Ltd. 2,378 Co. Ltd. £2,260

Crossley Bros., Ltd. 2,300 Campbell Gas Engine

Safety Concentric Co. Ltd. 2,176

Wiring Co. Ltd. 2,230 J. E. H. Andrews and Co. Ltd. 1,900

LONDON.—For the supply of dynamo, &c., required in connection with the electric lighting of the Victoria Embankment, for the London Council:—

Electrical Co. Ltd. £26,877 0 Crompton and Co.

Safety Concentric Ltd. ... £4,919 0

Wiring Co. Ltd. ... 5,625 0 Mather & Platt Ltd. 4,000 0

Electric Construction Co. Ltd. ... 5,535 0 field ... 3,726 5

LONDON.—For building stabling and offices, Wicklow-street, Grays Inn-road, for Messrs. W. H. Greaves, Messrs. W. S. Croft and Kekwick, architects, 18, Outer Temple, Strand. Quantities supplied:—

McCormick and Sons £4,999 Patman and Fother-

Love and Co. ... 4,799 ingham ... £4,533

J. Jarvis and Sons ... 4,614 H. Wall and Co. ... 4,511

Chessum and Sons ... 4,575 J. Carmichael ... 4,497

George Neal ... 4,538 T. G. Sharpington ... 4,450

\* Accepted. Dearing and Son\* ... 4,433

ST. ANDREW'S (N.B.).—For the construction of a storage reservoir, for the Water Commissioners. Messrs. Belfrage and Carfrae, C.E., 1, Erskine-place, Edinburgh:—

J. Kirk ... £12,723 8 11 J. Kirkcaldy ... £2,960 5 0

Adam and Co. ... 12,634 0 0 J. and C. Hay ... 9,927 0 0

T. Munro ... 12,522 2 5 R. C. Brebner and

W. G. Fleet ... 12,047 12 1 Co. ... 9,452 0 0

J. Martin ... 11,965 15 3 R. Marshall ... 9,029 3 6

A. Brunton & Son ... 11,831 16 0 J. Angus ... 8,805 9 4

A. Fraser, jun. ... 11,243 18 7 G. Mackay & Son

G. Dick, jun. ... 10,796 0 0 Broughty Ferry\* 8,514 0 0

Kennedy ... 10,112 13 1 \*Accepted.

SHEFFIELD.—For the construction of roads, &c., Banner Cross Estate, for Mr. W. H. Greaves, Bagshawe. Mr. J. D. Townend, surveyor, Independent Buildings, Fargate, Sheffield:—

G. Webster ... £2,128 0 0 G. Eyre ... 1,131 16 3

B. Powell ... 1,920 0 0 F. Angus, Hills-

J. E. Nadin ... 1,324 16 10 borough\* ... 1,150 17 9

B. Roberts ... 1,276 14 10 \*Accepted.

TONBRIDGE.—For proposed boiler, chimney shaft, and flues, at the Tonbridge Union Workhouse, for the Tonbridge Board of Guardians. Mr. H. C. Lander, A.R.I.B.A., architect, Edingham House, Arundel-street, Strand, W.C.

Quantities by Mr. C. A. Jacques, 23, Dartmouth Park-avenue:—

W. Nall and Co. ... £723 13 3 K. C. Jarvis, Ton-

Strange and Sons ... 600 0 0 bridge\* ... £200 0 0

Cross and Co. ... 591 4 3 Myles and Warner ... 403 10 0

\* Accepted.

**CONTRACTS OPEN.****WILLESDEN DISTRICT COUNCIL.  
TO BUILDERS.**

The Willesden District Council are prepared to receive TENDERS for the EXTENSION of PUBLIC OFFICES in Dyne-road, Kilburn.

Plans and specification may be seen, and all further particulars obtained upon application to Mr. O. CLAUDE ROBSON, M.Inst.C.E., Engineer to the Council, Public Offices, Dyne-road, Kilburn, N.W.

Quantities, to be obtained from the Offices of the Council, will be supplied to competing builders upon the payment of £10 per copy, which sum will be returned upon receipt of a bona-fide Tender.

Tenders, endorsed "Public Offices," to be delivered at the Offices of the Council not later than FOUR p.m. on TUESDAY, FEBRUARY 14th, 1899.

The Council do not bind themselves to accept the lowest or any Tender.

By order.

STANLEY W. BALL,  
Public Offices, Clerk to the Council.  
Dyne-road, Kilburn, N.W.  
January 25th, 1899.

**HASTINGS UNION.****TO BUILDERS AND CONTRACTORS.**

The Guardians of the above Union hereby invite TENDERS for the ERECTION of NEW WORK-HOUSE BUILDINGS on land belonging to them in Cackle-street, Hastings.

Persons desirous of Tendering may inspect the Plans and Specifications at the Office of the Architects,

**BOWER & FLORENCE,**  
Polished Granite Manufacturers,  
**ABERDEEN, N.B.**

London Office: 64, FINSBURY PAVEMENT, E.C.  
Quarries: PETERHEAD, N.B.

Messrs. JEFFERY and SKILLER, No. 5, Havelock-road, Hastings, between the hours of TEN a.m. and FIVE p.m. Bills of quantities can be obtained from the Architects on receipt of a deposit of Five Pounds, which amount will be returned on a bona-fide Tender being delivered.

Sealed and endorsed Tenders to be sent to the undersigned at the Offices of the Guardians, 11, Wellington-square, Hastings, not later than TEN a.m. on THURSDAY, FEBRUARY 16th, 1899.

The Contractor whose Tender is accepted, and with whom a Contract is entered into, will be required to give Bond with Sureties to be approved by the Guardians for the due performance of the Contract.

Neither the lowest nor any Tender necessarily accepted.

By order,

ARTHUR R. INSKIPP,  
Clerk.

No. 11, Wellington-square, Hastings.  
January 19th, 1899.

## DESIGNING WINDOWS.

THE President of the Royal Institute of British Architects, in a recent address, stated:—"There is one feature we want badly, and that is a well designed large window; for there is great demand for these in the new public buildings, and we have nothing but the large Roman semicircular window of the baths, and the west-end perpendicular windows, which have little claim to beauty."

It seems that the professor abandons the idea of producing anything original, and invites the new blood in the younger members of the Profession to originate a new window. This has been attempted with varying success by nearly everyone who follows the Profession of Architecture. If we are to judge from one or two specimens that have actually been executed, it would be as well if the designers were to abandon the idea also. Octagonal windows do *not* look pretty, neither do inverted semicircular windows.

Though an element common to all Architecture, the window possesses a significance which can scarcely be surpassed by any other feature. As the channel for light, it has its function in bestowing health and cheerfulness on the inmates of a building; as an element

studied regularity of the fenestration has completely sacrificed internal light and convenience, and has been made the excuse for perpetrating many absurd arrangements.

To avoid these anomalies, windows ought to be fixed in position by the plan, having regard to the main divisions of the façade. The question of how to determine the width and number of apertures is important. Here physical conditions come into play. As the rays of light proceed in parallel lines from a window receiving light from an illuminated sky surface—and this view is practically correct—we may assume that the size and proportion of a window-opening will be the best guide to the size and proportion of a room that can be efficiently lighted by it. Thus, roughly, a long and narrow room, with a window at one end, will be best lighted by a tall, oblong opening; or, if the light is to be admitted along one side, two or more short windows will be sufficient. This conclusion will be apparent if we consider that a window of, say, rectangular shape admits a prism of light of a sectional area equal to the opening, and we assume a certain angle or obliquity to the rays. If we take the section of a window opening in a wall, and draw a line from its top edge of the assumed angle, and another parallel thereto from the cill or lower edge of the window, we represent the direction of

through a window is that derived from the sky; and secondly, that the principal portion of such light comes from the upper part of a window, that near the zenith; hence, that the higher the window, the more intense the light.

Light near the horizon is often obscured by fog or smoke or opposite buildings. Geometrically we may represent the available sky surface as half a hemisphere placed with its flat side to the window. We describe in other words, on the plan, a semicircle of any radius from the centre of the window on the outside, and from the same centre and with the same radius a semicircle on elevation. Between these semicircles we can imagine the quarter sphere of the sky. This may be divided into zones by horizontal semicircles from the zenith to the horizon, of a certain number of degrees each—say 10deg.; also, we can divide the same quarter sphere vertically by quadrants, the same number of degrees apart, and we can affix a value to each division or sector between these two sets of lines. In this manner it is easy to calculate the light entering a window in any direction, and also the amount of light shut out by any obstruction. As our readers know, this plan of considering light and obstruction is employed in estimating the amount of obstruction in light cases; but the system is of equal value in ascertaining the quantity of light from the illumined sky

SKETCH SHewing COMMON METHOD OF KEEPING  
WINDOWS DOWN FROM CEILING

SUGGESTION FOR KEEPING  
WINDOWS UP CLOSE TO CEILING.

of architectural design, it is a powerful means of expressing character. And yet, strange to say, it is one of those things which are left pretty much to the fancy or taste of the designer. Its two-fold purpose requires that it should be determined by both the plan and elevation of the building, but the ordinary process is to make its size depend on the appearance, as studied in elevation, as if it had little to do with the interior. A window is put here or there, made a little larger or smaller, higher or wider, as a single opening, or divided into lights, to suit the elevation or the amount of space at disposal. It is sometimes a question of filling up a space in width, sometimes a question of height. This one-sided mode of deciding by external elevation cannot be a satisfactory method, for we get in one room perhaps two or three windows, and in another room only one, quite irrespective of the area or size of the compartment. In one part they may be clustered together, as in one corner of a room, and the other corner left in darkness. We know these awkward and inconsistent distributions of windows often occur in public buildings in the Classical style, much to the discomfort and inconvenience of officials and clerks. Some of the rooms of the War and Foreign offices suffer from this uneven distribution of light; and we may recall to mind many a modern municipal building in which the

such a prism of light entering a room. Extending these lines to the floor level, the latter becomes a horizontal plane, and will show how much of the floor will be illuminated directly by the window. The higher the window head the farther the rays of light will extend into the room, and a good idea will be obtained of the length the room ought to be from the window. Also, the nearer the window opening is to the floor the greater will be the extent of illuminated area, and the less there will be of a dark or unilluminated corner under the window. For practical purposes we may assume the angle of the light rays to be 45 deg. above the horizon, so that if the window-head is, say, 12ft. above the floor-level, the prism of light will extend the same distance into the room.

A simple geometrical construction of this kind will enable the architect to proportion the proper height and width of his window apertures, without having recourse to any calculations, such as are met with in treatises. The rule is easy, and can be quickly applied by drawing lines on the section to the angle at which the light is supposed to enter, or in making the depth of room from the outer wall not much more than the height of the window. It may be remembered for all practical purposes that in this dull climate of ours, when the sun so seldom shines directly on a window, the effective portion of the illumination received

which enters a given form of window, and it is for this purpose that we refer to it now.

It is shown by all authorities on light that the intensity of light from any part of such a sphere is proportional to the sine of the angle of altitude above the centre of window at the bottom. At the zenith, for example, we may call the intensity 1000; while at a point lower down, say, at an angle of 30deg. from the zenith, the same area will be represented by 866, and at an angle of 45deg. by the figure 707. Along the lower zones the intensity of light declines till at the horizon it is nothing. It is also worthy of notice that the intensity of light received from the portion of the sky or sphere above an angle of 45deg. is equal to that of the surface below it, though their respective areas are very unequal as measured on the sphere. If architects bore in mind this fact, they would see the necessity of placing their windows high in the room instead of low down; also, when light is essential, preferring clerestory to wall openings in some cases. Thus a long horizontal opening below the ceiling gives the best light, but such an aperture would not always be desirable.

The form and proportion of the window apertures are essential. A great deal may depend upon the style and destination of the building; but we now confine our attention to the principles, physical or geometrical, which should guide the architect in giving a form

and proportion to his windows, irrespective of the consideration of style. For agreeable proportion as applied to a plain rectangular window opening, we may take the windows of Somerset House, which are two squares in height, or two to one. Palladio generally used a double square, and this proportion is generally followed by the Italian architects. Examples are found in Chambers' "Treatise on the Decorative Part of Civil Architecture," and also in Gwilt's "Encyclopedia." But inflexible rules are useless, simply for this reason—that more light may be necessary in one room than another, and we have the differences of position, obstructions by opposite buildings, and other circumstances to consider in each case. The most desirable proportion for an aperture should be regulated by the size and shape of the room; thus, if it is a long room, and the window or windows are at one end, they should be tall, so that the light through their upper portions may penetrate well into the room. With regard to the size of the window, one good rule is to find the cube of the room in feet, and the square root of the product will give the area of the opening in feet, which may be given to one or more windows as required.

We do not place much confidence, however, in any rule which must be arbitrary, and therefore cannot apply to both bright and dull outlooks or to varied degrees of light; it is far more reasonable to consider the amount of illumined sky-surface before a given window or front of windows in the manner just

described, and to proportion the apertures to the actual amount of light available under a normal condition of sky. Thus, in darkened thoroughfares the windows ought to be high, and tolerably wide, so that as much of the zenith light may be secured as possible, and further, projecting pediments, balconies, and cornices should be avoided or reduced. It is better to err on the side of too much than too little light, so that the erection of buildings opposite may not seriously darken the rooms. The heads or upper portions of the windows are often darkened by traceried heads, and painted glass; hence the importance of making all decorative windows larger in area than is absolutely necessary for light, or than those which are plain and merely filled in with transparent glass. We very often see this rule neglected. Semi-circular heads are filled with carving in stone or terra-cotta modelling, or mullions carry perforated tracery, so that the most efficient part of the window is lost or the light is reduced to a considerable extent. A strong objection to the ornamental headed window is that the actual light aperture is necessarily low in the room to give space for the sculptured tympanum or tracery.

Another architectural arrangement ought to be noticed, quite as objectionable. In elevations of façades there is often a full membered entablature at the summit, and this, for the sake of construction, is generally placed so that the upper member or cornice is below the roof plate, the consequence of which is that the whole depth of entablature occupies a considerable space down the wall below the ceiling level, and the windows have to be placed low in consequence, their heads being beneath the soffit of entablature, with a blank space of walling over inside. We have here a serious impediment to effective lighting by windows, as the windows are too low to admit the best light, and the projection of entablature above obstructs the rays directly overhead. The difficulty is often met by omitting the lower members of entablature, and placing the cornice as high as possible. If there is a parapet and balustrade to act as a counter-weight to the cornice, the latter may be placed above the plate-level of roof, so that plenty of headroom is obtained for the upper windows. One way of getting over the difficulty is by the dormer, but the dormer arrangement is expensive. A frieze may often be perforated to admit light under the ceiling in addition to windows. The effect of wide piers between windows in one room is that dark shadows are cast; therefore it is an advantage to group windows together, rather than to separate them by wide spaces of wall.

The decorative treatment of windows is too large a subject to deal with in this article. In Eastern countries the window was small and unimportant as an architectural feature; its development has been simultaneous with the necessary enlargement of the aperture. The growth of Mediæval Architecture is largely identified with the increase of the

light aperture, as the student of Gothic tracery will at once recognise in comparing Early Romanesque or Norman with Late Perpendicular. But the ordinary window, with its accompaniments, is a product mainly of the Italian Renaissance. At first a mere aperture for light in a wall, it soon began to develop in size and significance. We have, first, the architrave and pediment as a frame, as we see at the Farnese Palace, Rome; the Reform Club, Pall Mall; and Somerset House; then we have the lighter palatial styles of Venice in such palaces as the Vandramini, and the Pesaro, or the well

known library of St. Mark's, where two orders inclose arcades and openings of considerable area, with a range of panel lights in the upper frieze; with the evident intention of obviating the dark blank space above the main arcade of windows. In these and other instances the solids are reduced to a minimum, the wall disappears, and attention is concentrated instead on the orders of columns which form the piers and the horizontal lines or arcades. The process has been similar to the growth of window tracery; at first there was only an opening—a mere group of lancets—which in time began to be placed nearer together till mere mullions intervened, and at length "plate" was exchanged for "bar" tracery.

Messrs. Matthews and Yates, Ltd., of Cyclone Works, Swinton, Manchester, have just secured a contract from the Admiralty for the supply and erection of washing and drying plant for the R.N. Swimming Bath, Portland. This firm have a speciality in laundry drying plant which has found especial favour in the eyes of our Naval Authorities, and is being very extensively used by them in their numerous stations. We understand they are just completing a similar contract for the R.N. Hospital, Great Yarmouth.

Improvements at Scarborough.—The Corporation of Scarborough have applied to the Local Government Board for a Provisional Order for the extension from August, 1899, to August, 1902, of the time for the completion of the new Marine Drive round the base of the Castle Hill. The drive will cost about £100,000, and will connect the South Foreshore with the Clarence Drive on the North shore. The progress of the work has been seriously interfered with owing to the difficulty experienced in building the wall at Coffee Pot Rock. At this point the sea washes up to the line of the proposed road. It has, therefore, been decided to modify the original plans, and build the wall about 30ft. nearer the cliff. Another projected improvement is the conversion of St. Nicholas House and grounds, which have been bought for £33,000, into municipal offices and public pleasure grounds.

## Masters and Men.

**The Bolton Engineers** decided, at a meeting held on January 27th, to give notice for an advance of two shillings per week wages, but to postpone definite action for a month. It was reported that the masters would favourably consider the matter.

**A Lock-out averted at Norwich.**—A dispute has arisen in Norwich with reference to the laying of Broseley tiles. The masters insisted on their right to let out tiling to merchants who supply the tiles; the men on the other hand contended that the laying of tiles was bricklayers' work and not slaters. Through the friendly mediation of Messrs. Boardman and Son the masters have conceded the men's point, and a lock-out has been averted.

**Labour Disputes in Aberdeen.**—The building trade in Aberdeen is in a disturbed state at present, owing to agitations for advances in wages on the part of the painters and also of the joiners. The former demand an increase from 7½d. to 8½d. per hour, together with certain alterations of the rules with regard to overtime, holidays, and apprentices. At a recent meeting of the Masters' Association it was unanimously decided not to accede to the men's demands. A strike is therefore imminent. The demand of the joiners is for an increase of ½d. per hour. They also have been met with a refusal, and as a consequence went out on strike on Feb. 1st. More than 600 men are involved in this dispute. The executive of the Scottish Building Trades' Federation has unanimously resolved to support the master-joiners in resisting the men's demands.

**The Masters Builders' Association.**—The twenty-first annual conference of the National Association of Master Builders of Great Britain and Ireland was held at Bradford on Jan. 31st. The retiring president, Mr. J. E. Jones, moved the adoption of the report. He said the Council had had a great deal to do during the past six months. First of all there was the Federation scheme. At their last half-yearly meeting the absolute need of federation had been realised, and the scheme had been carried to completion. The relationship of the association to the operatives had been somewhat unsettled lately, and the association had received numerous notices of increase of wages and alteration of rules to come into force in the spring. During the past six months there had been no serious strikes, for it was unusual in the building trade to go out on strike in the winter months. But the aggressive attitudes adopted by some of the trade unions, particularly in reference to freedom of management on the part of employers, had become no longer bearable. No doubt the Council would be called upon to enjoin the Federation to adopt some policy which would effectively check these aggressive measures. — Alderman W. Holdsworth, of Bradford, was elected president of the association for the ensuing year. — Considerable discussion took place as to the power of the standing committee. It was eventually decided "That all cases of emergency arising between the full meetings of the Council shall be dealt with by the Standing Committee." — On the motion of Mr. W. Cunliffe it was unanimously resolved that the executive should do all they could to secure the formation of a foremen's union, and insist upon the foremen joining it and being liberated from the operatives' union. A donation of ten guineas was voted to the Free Labour Association, and the question of the plasterers' dispute was then considered in private. — The result of this discussion is stated below.

**The Plasterers' Strike.**—The prospects of peace are a little more hopeful than they were a week ago. At the meeting of the National Association of Master Builders, held at Bradford on Jan. 31st, it was unanimously

decided to call on the Plasterers' Union for an assurance that they in future abstain from the objectionable practices set out in the printed circular of Jan. 10. The practices in question were those referred to in last week's BUILDERS' JOURNAL. It would appear, however, that the masters have since modified their demands, confining them to the two most serious points in dispute—the persistent attempt to coerce foremen into membership and the restrictions on apprenticeship. This is an important move in the direction of conciliation. The Master Builders' communication has been referred by the officials of the Plasterers' Association to their executive council. Nothing further is likely to be done until the result of the men's ballot on the question of foremen is made known.

**Conciliation and Arbitration.**—The annual meeting of the Board of Conciliation and Arbitration for the manufactured iron and steel trade of the north of England was held at Newcastle-on-Tyne on January 30th. Mr. W. Whitwell (president) in the chair. Mr. J. R. Winpenny (joint secretary) read the annual report of the standing committee, which stated that the number of firms in membership with the board was nine. The average number of operative subscribing members during the half-year had been 4081. The president, in moving the adoption of the report, said that the board was not standing still. Three large and important works were about to join the organisation. It looked as if the board would again become the powerful organisation that it once was in the North. The members had confidence in one another, and he did not remember a single instance in which there had been anything in the nature of misrepresentation on either side of the table as regarded facts or difficulties. Mr. E. T. Trow (joint secretary), in seconding the motion, said the operatives had confidence in the board, and they had always met with courtesy from the employers' representatives.

## Builders' Notes.

**A New Market** is to be built on the site of the old Portman Market, in Marylebone, which is within an easy reach of the Paddington terminus. The new market, the plans of which have already been approved, will have all the modern conveniences required for the disposal of meat, fish, vegetables, and general provisions, and there will also be a hay market and coal offices. It is anticipated that the building will be opened for business in about six months.

**The New Kew Bridge.**—Mr. Easton Gibb, of Skipton, the contractor who has undertaken the task of building the new Kew Bridge, is erecting workshops close by Kew Green, and very shortly definite operations will be commenced for the construction of the temporary bridge, which is to be built to the west of the present structure, and will serve until the new one is completed. The cost of the new bridge, including the temporary one, is £150,000.

**The Rebuilding of Highgate Archway,** which is being carried out by the London County Council, does not proceed very rapidly, owing, it is said, to the difficulty experienced in getting material, especially steel. For two months the work has had to be entirely suspended on that account. The gas and water mains going over the viaduct are to be specially constructed of light steel, and the bridge girders are also of steel. The work is again proceeding, however, and by the end of this year it is probable that the structure will be sufficiently advanced to allow of traffic going over it. The new bridge is to have a clear span of 120ft., and the width of the roadway over it will be 40ft., 16ft. of which will be appropriated for footways. It will be 62ft. above Archway Road. The estimated cost of rebuilding is £28,000.

**Master Painters of Scotland.**—The annual meeting of the Association of Master Painters of Scotland was held at Dundee on January 27th. The annual report showed that the membership is at present about 300; the past year has been on the whole a good one for the trade, and no serious disputes have occurred between employers and employed. — Mr. William Brown, of Dundee, was elected president for the coming year. — Mr. T. Delgaty Durn read a paper on "The Technical Education of Painters," in the course of which he urged employers to encourage their apprentices to attend technical classes. — Mr. A. L. Gray read a paper in which he deprecated the system of scamping work—undertaking to do work for a certain sum, and giving it only about half the number of coats of paint or varnish stipulated. He considered that the acceptance of tenders at prices too low to allow of good work was largely responsible for this scamping. On the 28th, an exhibition was held of work sent in for competition by apprentices. The principal prize—the President's gold medal for general excellence—was gained by Joseph S. Robertson, an apprentice with Mr. Joseph Nicholson, of Dundee.

**What is a Scaffolding?**—At Marylebone County Court his Honour Judge Stonor delivered judgment on January 25th in the case of "Stack v. Coulsell Brothers." The applicant was injured on September 8th by the fall of a joist while he was working, and it was admitted that he was entitled to an award in his favour if the building upon which he was engaged was within the provisions of the Workmen's Compensation Act. The building where the accident happened was much lower than 30ft. in height, and on its floor there were at the time of the accident two pairs of trestles with two boards resting upon them as a temporary scaffold to enable the workmen to work at the roof or ceiling. To bring this case within Section 7 of the Act it must be shown that the building in which the accident occurred "was being constructed or repaired by means of a scaffolding." His Honour said, with reference to this point, he thought that the building now in course of erection was not being "constructed or repaired by means of a scaffolding," for he thought that the proper meaning of "a scaffolding," at all events for the present purpose, was that given in the Glossary of Architecture, viz., "a temporary erection of poles, planks, cords, etc., for the use of workmen in building walls or executing any work which they cannot otherwise reach," which is always secured and fixed, and not a temporary erection of two pairs of trestles with boards across them, unfixed, unsecured, and movable by the workman as occasion may require. There was strong argument in favour of attaching the meaning given by the architect's glossary to the word in the clause under consideration from its manifest restrictive intention and operation with regard to the building business. It began by first restricting such operation to buildings "30ft. in height," no doubt on account of the additional danger attending on buildings of that and greater height, and then proceeded further to restrict it to such buildings if they were "constructed or repaired by a scaffolding," no doubt also on account of the additional danger arising from the use of the same. Now, if this was to extend to every unfixed and movable erection of trestles, boards, ladders, &c., as contended on the part of the applicant, these words would be wholly nugatory, inasmuch as every building 30ft. high must be constructed by such means, at all events as to the roofs, ceilings, &c., and the words "constructed or repaired by a scaffolding" would have no effect, restrictive or otherwise, whatsoever. He therefore found for the respondents and dismissed the application.

**Street Works at Sheffield.**—The Highway and Sewerage Committee of the Sheffield Corporation have under consideration a large scheme for private street works. The work is to be done in sections, extending over a period of three years.

Engineering Notes.

**The Engineering Trade at Hull** seems to be in a bad way. At the annual meeting of Earle's Shipbuilding and Engineering Company on Friday the managing director stated that Hull, and especially his Company, had been made the cockpit for trades unionism with the result that they had had constant strikes and disputes. In three years by such disputes fifty-five weeks had been lost, and he suggested the Company should be voluntarily wound up, or remove its plant to some place where the men would be more willing to work. Several shareholders advised the winding-up of the Company if they were not better treated by the men in future.

**Electric Lighting at Sheffield.**—The question of the electric lighting of Sheffield, more particularly with regard to such public buildings as the Town Hall and the Police Offices, has been under consideration by the Lighting Sub-Committee of the Watch Committee of the Corporation. It has been decided that the vicinity of the Town Hall in Pinstone Street and New Surrey Street shall be lighted with electricity as soon as possible. In order to get a direct current for the supplying of electricity for lighting and mechanical purposes, the committee have ordered a motor at a cost of upwards of £1000, by which the current may be transferred from alternating to direct, and made available for use in the working of lifts and light machinery. The greater question of the electric lighting of the city generally has yet to be dealt with.

**Institution of Junior Engineers.**—Sir W. H. White, Director of Naval Construction, took the chair in his capacity of President at the fourteenth anniversary dinner of this Institution on January 28th at the Westminster Palace Hotel.—The President, in responding to the toast of "Naval Architecture," advised the Junior Engineer never to give way to the thought that he had come to the end of his power of improvement or of his capacity to learn. There were only a limited number of Islands in the world, but there was such a thing as Island-making. Africa had been made an island, and perhaps that was the reason why there was so much trouble about it. The great ambition of the United States was to make another island of what was now known as the South American Continent. What would happen when that was done? He did not know. He only knew that whenever the civil engineer made water communication possible, there the naval architect was able to provide the means of transport and trade. So he said to all other engineers: "Go on; the more the merrier."

**Harbour Works at Dieppe.**—Important new works are shortly to be put in hand, with a view to improving the entrance to the port of Dieppe. The cost of carrying out the project is expected to amount to about five million francs.

**Electric Tramways for Aberdeen.**—At a meeting of the Tramways Committee of the Aberdeen Town Council, on January 30th, the system of electric traction to be adopted on the Woodside route was considered. After discussion, the committee agreed to instruct Mr. Bell, electrical engineer, to bring up a report as to the mode of electric traction it was desirable to adopt, and the details regarding the work. It was agreed that cars similar to the "double-deckers" in Glasgow should be constructed for the Woodside route. The feeling of the committee was that the overhead system should be adopted.

**Wireless Telegraphs.**—At the South Foreland lighthouse, in the presence of representatives from the local district councils, some successful trials were made, on January 30th, under the supervision of Signor Marconi, of his system of telegraphing without wires between the East Goodwin lightship, twelve miles out at sea, and the lighthouse. The messages were received and recorded on the tape with absolute accuracy. The height of the pole used for transmission was 130ft., and Signor Marconi considered that by this a message could be sent to the French coast. The receiving wire on the lightship was run 80ft. up the mast. During the recent severe weather the system has worked perfectly, and the men on the ship have sent messages that have been transmitted to Ramsgate.

**A Remarkable Engineering Success** has been achieved at Gainsborough. Nearly two years ago Messrs. Timmins and Sons, of Runcorn, were carrying out the second borehole of the Gainsborough artesian well scheme. Through the accidental breaking of the rope used in boring, the contractor had the misfortune to lose the boring tool, weighing 35cwt., and being 30ft. in length, at a depth of 724ft. For two months the working staff were occupied in endeavouring to lift the tool, but without success. Further operations were decided on, and a few days ago the tool was successfully brought to the surface, together with several tons of soil. There is now every possibility of the artesian scheme being carried to a successful issue. The contractors are to be congratulated upon the persistency with which they have dealt with the difficulty, which at one time seemed almost insurmountable. £3000 has just been laid out in a new pumping plant for the No. 1 borehole, and a similar sum is to be expended in connection with the second boring.

Surveying and Sanitary Notes.

**A New Photo-theodolite** for photographic surveying has been invented by Mr. J. Bridges-Tree. The instrument has been adopted by the Indian Survey and Indian Meteorological Department, the United States Geological Survey, the French and other Governments.

**Proposed New Canal for Hull.**—A meeting of property owners along the Holderness drain within East Hull has been held to consider the question of forming a portion of the drain into a canal. It is not intended at present by the promoters to go beyond the eastern boundaries of the city; but, no doubt, if sufficient capital is forthcoming, the Holderness drain might, at a moderate outlay, be converted into a canal for the accommodation of small craft, and were the conversion within the city boundaries effected there would, it is expected, soon be established along the banks manufactories of various kinds. The plans of the proposed canal have been drawn by Mr. W. A. Gelder, architect (the Mayor). After considerable discussion, the consensus of opinion was that it was desirable the suggestion should, if possible, be carried into effect, and a committee was appointed to consider suggestions and report to a future meeting of the promoters.

**The Status of Sanitary Inspectors.**—The sixteenth annual dinner of the Sanitary Inspectors' Association was held last Friday evening at the Holborn Restaurant. Sir John Hutton, in proposing the toast of the evening, "The Sanitary Inspectors' Association," said that, as to the status of sanitary inspectors, they had time out of mind recorded the fact that their appointments were of too precarious a nature to give confidence and comfort. At present a sanitary inspector was appointed for a single year only, and if he did his duty it was very likely he would soon be dismissed. There were cases on record in which the want of fixity of tenure had demoralised sanitary inspectors. They must educate the public until they brought about an alteration in that respect. In regard to remuneration, too, an improvement was necessary. It was absurd to think that an inspector could be properly remunerated by a pittance of £75 or £100 a year. A commencing salary of £150, rising by annual increments to £250, would be only a reasonable payment. In conclusion, he denied that sanitary inspectors were the enemies of the people. They were the sanitary police, and as such they could not be bribed, and were worthy of their hire.

Property and Land Sales.

PERIODICAL SALES.

ESTABLISHED 1843.

MESSRS. H. E. FOSTER & CRANFIELD (successors to Marsh, Miller, and Co.) conduct PERIODICAL SALES of

REVERSIONS (Absolute and Contingent), LIFE INTERESTS and ANNUITIES, LIFE POLICIES, Shares and Debentures, Mortgage Debts and Bonds, and Kindred Interests,

on the FIRST and THIRD THURSDAYS in each month throughout the year, at the MART, Tokenhouse-yard, E.C.

The following are the appointments fixed for 1899:—

February 16th	June 1st	September 21st
March 2nd	June 15th	October 5th
March 16th	July 6th	October 19th
April 6th	July 20th	November 2nd
April 20th	August 3rd	November 16th
May 4th	August 17th	December 7th
May 18th	September 7th	December 21st

Offices, 6, Poultry, London, E.C. Telephone No. 999 Bank.

SURREY.—Choice BUILDING ESTATE.

—In a charming district, two miles from Horley station (L.B. and S.C. Ry.) under one hour from London and adjoining a village where are church, shops, and post-office; two miles from Roman Catholic Church.

FOR SALE, a compact and valuable FREEHOLD PROPERTY of 53 acres, with a frontage to the main Brighton road of 2000ft., and perfectly ripe for development, with residences of a good class. Prettily timbered. Gas and water mains along the frontage. Would be divided.

Plans and full particulars of the owner's agents, Messrs. GREEN and SIMES, Auctioneers and Estate Agents, Blenheim Mansions, Queen Anne's-gate, London, S.W.; or Mr. W. M. LEACH, Auctioneer and Estate Agent, Crawley, Sussex.

FAIRMILE PARK, near Cobham, Surrey.—A FREEHOLD BUILDING ESTATE of about 40 acres, with possession.

MESSRS. DRIVER and CO. have received instructions to offer to AUCTION at the MART, Tokenhouse-yard, Lothbury, NEXT SPRING (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairmile Station, and about a mile and a half from Cobham Station. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) possessing charming views over the intervening country to Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and will be included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of CHARLES JUPP, Esq., Solicitor, 48, Lime-street, E.C.; and of Messrs. DRIVER and Co., 23, Pall Mall, S.W.

By order of Trustees.—Preliminary Advertisement.—Freehold Building Estate, Streatham, near West Norwood Railway Station.

MESSRS. FIELD and SONS, and Messrs. WOLFORD and WILSHIN, who are jointly concerned, will SELL by AUCTION, at the MART, at an early date, a valuable FREEHOLD BUILDING ESTATE, known as High View Park, comprising 16a. 1r. 10p., lying immediately at the rear of and with approach from Leigham Court-road; also a contiguous Freehold Building Site of 2a. and 5p. in a new road intended to connect Canterbury-grove with Thurlby-road.

Particulars and plan, in due course, of Messrs. KINGSFORD, DORMAN, and Co., Solicitors, 23, Essex-street, Strand; of Messrs. WOLFORD and WILSHIN, Auctioneers, Anerley, S.E.; and of Messrs. FIELD and SONS, as above.

LEA VALLEY, PONDERS END, and BROXBORNE.—Freehold Wharf and Building Land, the latter with possession, some of which has been included in the schedule of the land required by the East London Waterworks Company.

MESSRS. NORTON, TRIST, and GILBERT will SELL by AUCTION, at the MART, Tokenhouse-yard, London, E.C., on TUESDAY, FEBRUARY 28th, 1899.

LOT 1.—8 acres 0 roods 11 perches of Land, with a frontage of 500ft. to the Lea and Stort Navigation Canal, also bounded on the north and east sides by the stream. This land is situate immediately opposite the Corticine Floor Covering Works, Ponders End, and is a fine site for the erection of a factory requiring waterside accommodation. It is in the occupation of Mr. Ives. This land has been scheduled to be acquired for the New Reservoir for which the East London Waterworks Company are applying for Parliamentary powers.

LOT 2.—14½ Acres of Freehold Building Land, with a frontage of 1080ft. to the road, close to Dobbs Weir, and within one and a half miles of Broxbourne Town and Station, now ripe for building purposes, possession of which can be given on completion of the purchase.

Particulars and conditions of Sale may be obtained from the Senior Official Receiver in Bankruptcy; of Messrs. CLARKE, RAWLINS, and Co., 66, Gresham House, London, E.C.; at the MART; and of the AUCTIONEERS, 70, Queen-street Cheapside, London, E.C.

To Land Syndicates, Building Societies, Capitalists, and others.

PINNER.—Important Freehold Building Estate of over 47 acres, with residence, known as Barrow Point, occupying a beautiful position close to the quaint old village of Pinner, within five minutes from the railway station on the Metropolitan line, and extending to within about ¾ of a mile of Pinner Station on the London and North-Western Railway, having easy access from the West-end and City. The whole ripe for immediate building operations, and admirably adapted for villa residences of a superior class.

MESSRS. FAREBROTHER, ELLIS, MEGERTON, BREACH, GALSWORTHY, and CO. beg to announce that the above valuable PROPERTY, which they recently offered for Sale by Auction, may now be treated for privately.

No. 29, Fleet Street, Temple Bar, and 18, Old Broad Street, E.C.

HONOR OAK.—Important Sale of FREEHOLD BUILDING LAND, forming an appreciable portion of one of the most salubrious and rapidly-increasing suburbs of the City of London, with numerous railway facilities to all parts of the metropolis, and presenting admirable sites for the erection of private Residences.

MESSRS. FAREBROTHER, ELLIS, MEGERTON, BREACH, GALSWORTHY, and CO. are prepared to SELL the few REMAINING LOTS of the above FREEHOLD BUILDING ESTATE, by Private Contract.

No. 29, Fleet-street, Temple-bar, and 18, Old Broad-street, E.C.

## An Architectural Causerie.

### A Plea for a Unity of the Arts.

THE period of undebased Italian Art in Architecture ran

from about the middle of the twelfth century to the early part of the fifteenth century. It was during this period that the elemental Lombardic Gothics developed into the loveliness and grandeur of the pure Gothic, as can be seen in the few examples left us, unspoiled by the ruinous touch of centuries. An examination into the causes which underlie this splendid revival would, of necessity, be a long one; but, were the investigation conducted in an unbiassed critical spirit, the manner of the growth of this particular beauty in Architecture could be traced to what we would call "The Unity of the Arts." Architecture in the thirteenth and fourteenth centuries—in Italy at all events—stood, in relation to the great masses of the people, as music stands to us at the present. When we say "the people," we mean those—as that part of the people of to-day—who take at least an intelligent interest in what we now call the "Arts and Crafts." This designation, by the way, gives a momentary proof of the disunion of the Arts and the Crafts in our own minds. Such a condition of intellectual appreciation brought about a state of things which made of the people a community of architects. That is, not of necessity architects in actual pursuance of a practice, but architects in sympathy, and the excellence of their appreciation. An intellectual standpoint such as this, taken by a people with regard to their national Art, did, of course, act irresistibly as a deterrent to weak or futile expression. Also, it voiced a strong matter of fact, and severe criticism, beating down remorselessly that part of the practising community wanting in the conception of originality and beauty. This, in time, set up such a high standard of excellence for the architect, that many saw their inadequacy and inefficiency with regard to the conception of a great building. Some of them devoted themselves to the small tributary streams of art which flowed with absolute certainty towards the great river of national Art—Architecture, constituting the national Art thereby, a dependent upon each of their individual efforts for its amplification. Nor was this all; for the lesser arts governed their artistic demands by the needs of the national Art, forming between them no mere "working alliance," but perfect amity of thought and unity of spirit. Here we have a very rough and necessarily incomplete exposition of the principal causes which made Italian Architecture a byword for beauty in the period we have named. It is so briefly stated as to be scarcely an outline even, but it traces the main powerful influences at work which brought about that end. Let us consider the condition of the average mind in reference to Architecture to-day. We take the average, for it is here that the bulk of opinion lies, and it would be obviously unfair to judge by the few intellectual æsthetics at the head of things. We do not think that there are many who would

wish to combat the assertion that Architecture to-day is certainly not regarded as a national art. In the ranks of the cultured practitioners themselves we have encountered profitless discussions, of interminable length and irritability, as to whether "Architecture is a Profession or an Art," or "the necessity of making Architecture a close Profession." Discussions such as these would seem to come from minds unconvinced of the nobleness of their art, and unenlightened as to the splendour of its past; nor do they see that the exclusiveness they would claim for it would act as an effective bar to that unity which we

solely dependent upon itself, its own individual impetus, and without the smallest connection with neighbouring art influences, that is, direct influences. We find all these lesser arts, which, in the thirteenth and fourteenth centuries, were tributary to the great natural stream, running independently, without aim or end in view. Nay, even completely out of sympathy with each other, which state of existence may rapidly develop into an active antagonism. Yet the strangeness of it is, that the innate excellence of each is of an advancing high order, and it cannot but be thought how lasting a mark

ELGIN CATHEDRAL. INTERIOR OF CHOIR. (See page 19.)

have seen was the cause of the Italian revival in the thirteenth century. Exclusiveness is one of the most pitiable signs of decadency in art. It speaks of removal from the open field of competitive expansion, and seems to give up its claim to power as a fighting force, or, if you would have it another way, as a regenerative influence. Little thought, however, need be expended upon such arguments; for, upon the very statement of them, we can distinctly see our side; but we have mentioned them as illustrative of the spirit reigning amongst us to-day. Again, although we cannot but look with satisfaction upon the progress attained in recent years by the "minor arts,"—the name is not our own—there can be little doubt that each exists

would be left upon Art generally were they diverted into a main current of action. There is a class of industry in Art designated as the "Allied Arts." We do not declaim against the name as false, for it is painfully true; but again it is apparent how far away is the ideal of a great unity of artistic effort when such a name is accepted. It is not that there is opposition to the unity of our ideal; but that the idea of such a unity is not even contemplated as possible under the present conditions of social existence. We do not wish to enter into a discussion of social possibilities, for such a question can be decided only by the combined and expressed will of the interested public generally. Our aim is rather to point out what has been

achieved in the past and by what means. We will not even venture to draw conclusions or a moral from such knowledge; that is left for the Art influences to resolve themselves. We cannot exercise pressure upon an awakening consciousness of latent artistic effort; but we may indicate like a vane arrow truthfully which way the wind blows. As Dr. Caird said, in one of his University addresses delivered at Glasgow, "It is in the province of the higher education to bring the mind, by the exercise of its own independent efforts, to the knowledge, not of the net results of inquiry on any subject, but of the principles on which they depend." It is in the province of higher criticism to represent each separate and limited department, not as a whole in itself, but in its organic relation with the other branches of knowledge; and if this principle is followed out consistently in its entirety, we shall not be far removed from "A Unity of the Arts."

"**The Wayfarer**" on the **Austere** and the **Florid in Architecture.**

"THERE are two kinds of Architecture," said the Wayfarer. "One kind may be classed under the heading of Austere Architecture, and the other might, perhaps, be termed the Florid. One may sometimes encroach upon another, but, broadly speaking, these two kinds cover all the styles of Architecture that have given the grace to a nation's life. In districts such as the one I shall be wandering through during the next three weeks the Architecture will be of the austere character." "Well, but how would you define the one from the other?" I interrupted. "Oh, that's rather difficult, but perhaps I can explain by a reference to the spirit which moves the builders. The one type of men," said the Wayfarer, pausing a moment to watch the movements of an earthworm in the ploughed field in front of us, "go to their work in a frame of mind which is more discriminating, more foreseeing of the result, select and use their materials with a care and restraint that the men who build in the florid manner fail to understand. The results strike an observer as simple masses decorated here and there, as if the men felt it necessary to relieve their restrained emotions by an outburst of luxuriant decoration. These builders stand in somewhat the same relation to building as the ascetic nature does to a society. I am particularly struck," continued the Wayfarer, thoughtfully, "with the changes that take place in the growth of an Architecture. After the experimental comes the restrained, the stiff, and perhaps a little unnatural kind of work, and then comes the flowering, the bursting of all those forces which up to that time had been kept well in check. These later men, the builders of the florid through an ardent love of life, are unable to pick and choose, but must, perforce, bring their work to its perfection by an unrestrained realisation of their power. The building, less architectural, begins to lose its form amid the riot of fancy and wealth of detail, of pleasure in the parts. The eyes are attracted to the lesser rather than to the general form. Speaking for myself," said the Wayfarer modestly and with that hesitancy of speech he assumed with such effect at times, "my predilections favour the austere; others hardly as wise but more joyful have decided preferences for the florid." Here the Wayfarer stopped as abruptly as he had begun, stepped into the ploughed field, and rapidly took himself across the public pathway which separated the field into two parts. I remained on the stile watching until his long and loose form disappeared into the wood at the further side of the field.

## On Reflection.

### A National Tribute.

MR. RUSKIN's eightieth birthday which, as briefly stated in our previous issue, fell upon last Wednesday, has not been allowed to pass unnoticed. Among the many letters of congratulation and open unaffected expressions of recognition and indebtedness for the noble ideals and inspired messages with which Mr. Ruskin has enriched our literature, and purified a materialistic and health-perverted age, none surely will be more acceptable, in the twilight of his declining years, than the address presented to him on behalf of the various Ruskin Societies existing in England. It is significant of the wide assimilation of Mr. Ruskin's lessons that this address has been signed by most of the members of the Royal Academy. The almost affectionate fervour of this address is such as would have prohibited its publication in the daily press, were it not that the sentiments expressed therein must awaken the sympathetic accord of all thoughtful people, whatever their opinion of the practical value of Mr. Ruskin's theories, or their susceptibility to his spiritual and emotional passages. All denominations, without distinction, must revere this great mind—this noble nature. His is a type that, whatever the motive may be that inspires its activity, must in all ages to the end of time command the ultimate veneration and devotion of clean, unsophisticated humanity. Not only has Mr. Ruskin urged an aim in life, and an ideal, which shall rise high above the coarse rule of expediency and custom, and a loftier ambition than the attainment of power and adulation, but he has sustained these ideals in his person and exemplified them in his own living. He has not only written his convictions and his theories, he has taught them by the magic of his personality and the skill of his own hand; he has subsidised schools, he has set his purse at the service of such of his students as seemed best able to benefit by foreign study, he has given away his fortune to advance the cause to which he is devoted, and it was only the other day that the volume of letters and diary excerpts relating to the pre-Raphaelites, published by George Allen, revealed how indebted the "brotherhood" was, not only to the master's encouragement and championship, but to his liberality. No reward of popular recognition or public honours ever had place in Mr. Ruskin's scheme of a ripe and perfect destiny; but he has known the bitterness of seeing the cold irresponsible acceptance of his most single-hearted labours, and it is pleasant to know that he has lived to see the leaves of the laurel entwined in that Crown of Wild Olives of which he has told us, and of which he, first of all men, is assuredly the wearer.

### The R.I.B.A. Prize-Winners.

A WRITER in the February issue of "Architectural Association Notes" calls attention to the frequency with which the prizes offered by the R.I.B.A. are won by members of the Association. Thus, during the last ten years a member of the Association has won the Essay Prize three times out of the six occasions on which it has been awarded; the Measured Drawing Prize, five times out of ten; the Soane Medallion, three times out of seven; the Pugin Studentship, five times out of nine; the Owen Jones Studentship, three times out of seven; the Tite Prize, four times out of nine; and the Grissell Prize twice out of seven. Of the subsidiary prizes, a large percentage also have gone to members of the Architectural Association. The remaining prizewinners have, for the most part, been Scotchmen, who are notorious both for the frequency with

which they appear on the prize lists and the excellence and personal force of the work with which they win their distinctions. This year the Edinburgh Association has been congratulating itself on the fact that three of its members have taken the three most coveted of the Institute Prizes, namely, the Soane, Owen Jones, and Pugin, while yet a fourth has been awarded a special prize in the last-mentioned competition. Mr. Fulton, whose work may be considered to have won first distinction in the late exhibition at the rooms of the R.I.B.A., hails from Glasgow, in fact, the discriminating connoisseurs of architectural draughtsmanship can ascribe his habitat and the scene of his early training to that city, by virtue of some special quality in his work.

### An Architect's Memorial.

It is to architects that the first legislative steps dealing with public advertisements will probably be due, for we cannot doubt that the memorial circulated at the instance of the Society for Checking the Abuses of Public Advertising, signed by 400 architects, and presented to the London County Council by Dr. Longstaff, will be instrumental in securing powers for the Council under which they may control the monstrous impositions of advertising patentees and agents. It is inconsistent with the discretionary powers the Council already hold for beautifying and adding dignity to the City, that the subject of public advertisements should be outside its jurisdiction; and the suppression by an appeal to Government on the part of the St. Martin's-in-the-Fields Vestry, of that ingenious advertising speculator who sought to make the architectural monuments of the metropolis screens for magic lantern advertising slides, indicates that the supreme authorities are not insensible to the impertinent encroachments of private advertisers upon what are undoubtedly the rights of citizenship. The magic-lantern operator who began to specialise on the Nelson Column with dancing coloured pictures glorifying beef tea and feeding bottles, assumed more than that share in a public memorial which he held only in common with every other citizen. Although no right of prospect can be established at Law, the only reason why an offence to the eyes is not recognised as a nuisance along with outrages to the senses of hearing and smell, is that it has been left to this latter end of the nineteenth century, with its wealth of scientific discovery and mechanical invention, to devise methods of annoyance by light and colour which can rival the ordinary offences of discordant noise and noxious smell. The memorial called the attention of the Council in particular to the illuminated advertisements which have multiplied so greatly during the past two years. As regards ordinary advertisement notices, the suggestions made in the memorial may be summarised as follows:—(a) A limit of height to be prescribed, above which there should be no exhibition of letters or other speaking emblems. (b) A limit to the size of letters in any position. (c) A rule that the space occupied by advertisement placards or letters should not exceed a certain ratio to the size of the building to which they are affixed. We confess a certain regret that the memorial does not lay more stress upon the advertisement hoardings which deform a large part of the beautiful counties lying round London, where both high road and railroad are lined with these abominations.

The memorial of Archbishop Benson, in Canterbury Cathedral, has been promised for completion by July 8th, and the unveiling has been fixed for that date.

ELGIN CATHEDRAL. CHAPTER HOUSE  
STALLS.

## ELGIN CATHEDRAL.

BY HENRY F. KERE, A.R.I.B.A.

*(Continued from page 5.)*

THE window over the west doorway is inserted in the first quarter of the fifteenth century. Messrs. McGibbon and Ross point out that the coat of arms on one side of the arch is probably that of Bishop Columba Dunbar, who ruled over the see from 1425-1435. Together with almost all the work of this wonderful building, this window is designed with rare and charming gracefulness.

Considerable alterations had evidently been made at this end at a late period, and also to the inner member and tympanum of the west doorway. From the inside we see the evidence not only of style but of masonry. And in the side walls of the tower, the arches and brackets are also of late date, very similar to the work which we shall now see in the chapter-house.

Of the chapter-house the masonry of all the bays, except the south, has had new windows of less size inserted. The original buttresses and walls were evidently retained. Judging by the design of the buttresses, which are strongly suggestive of the choir ones, and also taking into account the detail of the string mould under the window sills which recalls that under the great eastern windows, these buttresses and walls were erected just after 1270 or thereabouts.

Whether the chapter-house had been injured by the royal ruffian, already mentioned, in 1390, or otherwise, it seems that it was either Bishop David Stewart, or Bishop Andrew Stewart who remodelled it to the excellent form left to us.

The walls were thickened by being corbelled inwards, the corbel course of a most luxurious character. The central pillar is of exceeding chasteness of proportion, and fitly performs its part in carrying aloft the beautiful vault.

The bishop's stall is in the centre of the north wall, and on either side are two cusped panels supported on carved corbels, of kindred design with those we saw on the tower walls near the west doorway.

We get a better idea of the interior of the chapter-house doorway as we leave.

At our left hand is the fragment of a shaft and a cap, both of elegant design, but what part of the building they graced I am unable to conjecture.

I have indicated in the following paragraphs what I conceive to be the chronological sequence of the remains.

1st. Existing previous to 1224 the south and

north transepts, and part at least of the north wall of the choir.

2nd. Of date immediately subsequent to the foundation of the cathedral here, part of the clerestory of the north wall of the choir, the west towers and arcade over the west door, and the fragments of the clerestory of the nave adhering to the towers.

3rd. Of date probably subsequent to the fire of 1270, the choir, the shell of the chapter-house, and in the nave the south porch and the adjacent window jamb indicative of the nave being then of five aisles, and the west door.

4th. Following the year of the destructive fire of 1390 the rebuilding of the choir aisles.

5th. Probably during the Bishopric of Columba Dunbar (1425-1435), the west window of the nave, and perhaps the westmost window of the two remaining nave aisle lights.

6th. The chapter-house new windows and corbelled out walls, the central pillar and vaulting, date from 1482-1501.

Glasgow, Aberdeen, and Elgin are the only Scottish Cathedrals which had the western towers. The west towers of Elgin measure in their ruinous state about 85ft. from the floor of the church. They were capped it appears with wooden spires. Elgin had the more usual feature of a central tower over the crossing, also capped by a wooden spire. The latest spire is reported to have been 198ft. high, and was probably of somewhat similar design to that of Glasgow, which measures 219ft. high from the floor of the nave.

We have not many chapter-houses remaining in Scotland. Evidently in the majority of cases the chapter-house occupied the position of one of the choir aisles—for example, at Dunblane, Dunkeld, and in the first building of Elgin. Glasgow and Elgin have detached chapter-houses, the former square, the latter octagonal.

Iona and St. Andrews followed the more usual English fashion of having the chapter-house entered from a cloister, either on the north or south side of the church.

There is no Scottish Cathedral except Elgin with five aisles to the nave. St. Giles (Edinburgh), Manchester, and Oxford Cathedrals have chapels or extra aisles more or less developed. Chichester, however, in this respect is very like Elgin, although of smaller dimensions.

THE  
ARCHITECTURAL ASSOCIATION.HOW STAINED GLASS WINDOWS  
ARE MADE.*(Continued from page 6.)*

AT the conclusion of Mr. Christopher Whall's lecture on "Stained Glass," reported in last week's BUILDERS' JOURNAL, the Chairman, Mr. G. H. Fellowes Prynn, expressed the opinion that the informality of Mr. Whall's address was not in the least detrimental to its interest. If there was one subject upon which architects knew very little it was glass painting. Over and over again one saw tremendous ignorance displayed by architects who were supposed to supervise the work. This arose simply from the fact that they had not grasped the craftsman's side of the work. The architect was not altogether to blame, because so many of the glass firms were simply firms, not draughtsmen; the men who were able to make the best sketches were not able to carry out the actual design. It was the wish of architects to study the crafts as crafts; it was opportunity they lacked, and one of the things the Architectural Association was trying to do for its members was to enable them to get a more thorough knowledge of the crafts with which they had to deal. Architects wanted to be very much more in touch with the actual craftsman than they were. In glass working there was very much that must appeal to the architect, owing to the artistic nature of the craft. But it was rather puzzling to observe the different methods of glass workers. One glass artist would tell you that he would not use stippling on any account; one would depend very much for his effects upon his painting on the glass; another would prefer to use greens as whites, thinking the whites too glaring; while others would do just the reverse of these things. With all due deference to Mr. Whall, he should be sorry to condemn the use of green as altogether wrong, though he fully appreciated the value of getting true whites. He thought the working up of small sketches in the actual glass, as suggested by the lecturer, was a capital plan, as it would give the architect and his client a better idea of what the window would be.

ELGIN CATHEDRAL. NORTH DOORWAY.

INCISION OF 1270 DOORWAY INTO 1224 WORK.

Mr. Francis Bond said that, though he had never designed or made a stained glass window, he had had opportunities of seeing much of the best of the old stained glass. He sympathised strongly with Mr. Whall on the subject of green glass. Wherever he went he saw nowadays the substitution of green for the beautiful pearly white. At Mansfield College, Oxford, for instance, the windows were filled with glass from Burne-Jones' cartoons, but all the backgrounds were this abominable green. He could not imagine how this green had crept into the windows. At the end of the twelfth and the beginning of the thirteenth century, when the glass workers did not know how to produce pure white glass, they were obliged to put up with a horny white—a sort of pea-soup green. But as the making of glass improved the use of green was given up.

#### Ancient and Modern Work.

We should copy the perfection of the fifteenth century glass rather than go back to the archaic work of the twelfth. It was a delightful thing to see a window that was nearly all pearly white; many of our ancient churches had been disfigured by this green glass. Mr. Bond proceeded to speak of some of the later specimens of French glass at Rouen and elsewhere. With these he was extremely disappointed, there seemed to be far too much colour in the windows. In the fifteenth century in England we had pearly white glass with as little colour as could possibly be got into the window—a little bunch of red on one side perhaps, and blue on the other—that was the kind of window he should like to see revived. Another point suggested by his observation of French windows was that it was a mistake to have whole scenes represented in stained glass windows—of course there was plenty of precedent for it, but the whole thing was wrong. To try and copy the conditions of a glass painting in stained glass was quite a mistake.

#### Architect and Craftsman.

Mr. H. W. Pratt thought it was questionable how far a knowledge of the craft was serviceable to the architect, if he was not going to carry it out in a practical way. He might acquire a certain amount of information that might be of some use to him in designing geometrical work; but he (Mr. Pratt) thought the architect's sphere in stained glass work was practically limited to the subjects to be introduced, and the scheme of colour. At a craft school, where elementary work only was gone through, the colour question hardly entered into the teaching. He understood that most of these classes were for young fellows who were going to be brought up to the trade. It was a matter of consequence to the architect that any windows to be put into a building under his direction should not counteract the architectural treatment of the window; and in that respect it would be well if the architect and stained glass designer could work together. But he could not see how the architect would be helped by being trained in a craft school, seeing that he was not to have very much to do with the actual carrying out of the work. In respect to carpentry and masonry, where drawings and details had to be prepared for execution, it was desirable that the architect should have a knowledge of the actual construction; but stained glass work stood on a different basis. To get a knowledge of colour and design was more important than a knowledge of the actual craft of lead work.

#### Painted or Stained Glass.

Mr. Francis Hooper remarked that Mr. Whall had told them more about painted than about stained glass. Referring to the samples of work, he was glad to learn that these were by the pupils, because they seemed open to criticism at many points. Was it not possible to draw in such a way that the lead should represent the design? He believed it used to be specified that two-thirds of the glass was to be white. White glass seemed to be rather a reasonable background, inasmuch as most windows were intended for the admission of light. Beautiful effects were often obtained without any painting at all.

Mr. Flower asked how the objectionable

practice of wiring might be avoided. Would it be possible to have an extra thickness of glass outside, or to strengthen the glass itself so that it might safely stand alone? He would also like to ask how wide the leads might go, because in much work some of the effect seemed to be due to the width of the leads. Adverting to the question of green or white backgrounds, he referred to the windows in the ante-chapel at New College and to those at Holy Trinity Church, York, as examples of beautiful work containing a large proportion of pure white. The green phase seemed to have come in with the windows of Burne-Jones at Oxford; he hoped that it was a passing fashion, and that they would get back to the white.

#### Questions about Colour.

Mr. D. T. Fyfe asked for some information on the limitations of colour as applied to stained glass. Would Mr. Whall give a few remarks as to his theory of colour?

Mr. M. Garbutt said that the need for allowing light to pass through the windows should not be forgotten. Therefore pure white should be used rather than green, and for the deepest dark something far removed from black. The artist who did not use white, limited his palette very much. Many stained windows would be quite satisfactory if all the painting were struck out. He quite agreed that architects ought to understand more of the craft; to pretend to superintend work, of which they knew nothing, seemed to him the height of bumpiness. The man who had just an amateur knowledge was likely to do much better than one who was entirely ignorant.

Mr. T. J. Lucas asked, how many colours should be introduced into one window. If one colour was found, when the window was put together, to be unsatisfactory, how could it be altered?

#### A Bad System.

Mr. Christopher Whall replied at length to the points raised in the discussion. One must not, he said, cast blame upon anyone for the state of any particular art. We were all more or less the victims of a phase of feeling that preceded us, and took the form of a great deal of false teaching. For instance, the Gothic revival was to a large extent a theoretical and academic thing, and, unfortunately, it produced on an enormous scale a very defective system of art education—the entire disassociation of art from the crafts, which was embodied in the system known as the South Kensington system. One of the things resulting from this was the subdivision of labour which resulted in the practices of the stained glass firms, so that it required a certain amount of artistic heroism to pick up the whole of the craft. We were all the victims of that system, and it was useless to discuss who was most responsible for what was—it might be hoped—a state of things that was passing. He was glad to see so general an agreement with his remarks about white glass. He would not, however, discard the use of the greeny white; he only pleaded that, in the highest light of the window, pure white should find a place. As to whole scenes being painted on a window, the feeling seemed to be becoming more and more general that this was not wise. But it was not a thing on which to lay down hard and fast rules; if the worker observed the limitations of his craft they would sufficiently neutralise the realism of the thing to make it an appropriate form of decoration.

#### The Craftsman's Qualifications.

The stained glass craftsman ought to be to a great extent in wish and feeling an architect himself. He should look at the position and say: "I have not an open field to work in; I have only that particular field." A craftsman, who was also a designer, was almost certain to work in sympathy with the work of his brother craftsman, the architect. As to the streaky and cloudy effects, concerning which a question had been asked, Mr. Whall said that a good deal of cloudiness of old glass was caused by the corrosion of the surface due to age; this could not be, and ought

not to be, imitated. But there were streaky glasses made so partly on purpose, partly by accident. When the glass was made in pots it was, of course, coloured by the admixture of powders—oxides of various metals. As one got towards the bottom of the pot, more and more of the powder was left, and the glass worked up more and more in streaks. That was a valuable resource; the craftsman looked for those streaky bits and on occasion got beautiful effects by their use. On the question of stained versus painted glass, there were all sorts of opinions. Some purists held that no mat should be put on at all; and there was very much to be said for this plan. If one had a large amount of money and time to spend in obtaining the best possible specimens of glass, he could conceive that one might dispense with painting. But, generally speaking, some painting was needed to avoid the enormous labour of getting a satisfactory mosaic with the pieces of glass themselves; the very slightest film would bring the colours into a harmony that could not otherwise be obtained. On the other hand, there was a great danger of over-painting the glass. The rule was always to get to the clear glass for the high lights; in large portions the mat should be brushed clean away. The glass would not look glassy if it were filmed all over.

#### Leading and Wiring.

As to the use of the lead, there were certain things one must lead; where there was a difference of colour a lead must be put between; but to lead up every little part—as in the thirteenth century, when glass was cut by heat only—would involve limiting the design to a very great extent. He had always found it a good rule—since leading emphasised everything to which it was applied—to distribute it fairly and evenly over the whole of the picture. With regard to protecting the windows by wire, he hated the wire, but it must be remembered that there are such things as boys—and stones. He had put a wire guard outside a window in a public school, but ingenious youth managed to put its football through both guard and window. The alternative was putting a sheet of heavy glass outside, but the effect was very disagreeable from the outside.

#### The Choice of Colour.

One could, of course, use any thickness of lead, but half an inch was practically large enough for anything. It was very difficult to say anything about colour that would be practically useful. He liked the plan of using many varieties of one colour; in the great east window in Gloucester Cathedral—a magnificent specimen of fourteenth century work—though it was all in red and blue, there were hardly two pieces of blue alike. He did not limit his palette as to the range of colours; if he liked a thing he used it, but, of course, it required a great deal of discretion to be able to use a wide range of colour effectively. Domestic work should be limited to the quieter colours mainly, but in a large dignified building unrestricted freedom might be used in the choice of colour. He had been asked: "How does one alter mistakes?" He wished he knew. Some beautiful effects were got by doubling the glass, especially in the case of purple, which was not so well made nowadays as in earlier times. But, of course, this doubling made the work very expensive. In conclusion, Mr. Whall reverted to the question of the architect's position in reference to the craft. It seemed to him, he said, that a simile from music may be very much to the purpose. No composer had ever conducted an orchestra as a composer only. All the great composers were practical performers; that did not imply that they could play all the instruments of the orchestra. Students of music were required, in addition to their piano or organ studies, to take up the study of one or more of the orchestral instruments, the assumption being that such a study would give them a sympathy with the whole, and enable them the more wisely to direct the orchestra. So the architect might reasonably say: "If I learn one of the crafts fairly well, I shall be more in sympathy with the whole and better able to direct them to a good end."

## REDECORATION OF FISHMONGERS' HALL.

IN the course of last year the Court of the Fishmongers' Company decided to re-decorate their great hall with the entrance and main staircase leading to it. Mr. Crace was invited to assist the Company's surveyor, Mr. H. Chatfield Clarke, in reporting upon the treatment desirable; and their joint report was adopted by the Court. The works decided upon were carried out during the autumn, and completed before Christmas. The previously existing decorations were executed thirty years ago under the direction of Owen Jones; and some of the work then done remains in the reception rooms adjoining the Hall.

The building itself was erected in 1831 from the designs of H. Roberts, and is in the rather cold "Greek" character affected at that time. The late Sir Gilbert Scott, who was articleed to Mr. Roberts, took some part in supervising the erection. It was an instruction of the Court to Mr. Chatfield Clarke and Mr. Crace that the architectural detail and character should in nowise be disturbed. This has been strictly adhered to; but a much warmer and more "hospitable" result than before has been attained by the colouring, of which the following is a brief description.

The square entrance hall has a flat coffered ceiling divided by flat beams, and walls divided by pilasters, has the wall spaces of a lively Pompeian red, the pilasters, frieze and cornice being of a vellum tint, relieved in the frieze by a moderate amount of ornament executed in dull yellow and chocolate-brown. The pavement here, as also in the adjoining staircase corridor, is of marble mosaic, laid out on a simple geometric scheme in mixed shades of white, with bands of black, light red, grey, and yellow.

The corridor in question and the lower story of the grand staircase, to which it is open on one side, have also red as the ground colour of the walls; at the top a frieze is painted in light ornament upon the red ground, interrupted at intervals by panels or medallions, with dark grounds. Below, a dado of simple Pompeian character is worked on a darker tone of red. The large piers at intervals are in light colour, with bronze and gold enrichments; and the ceiling is vellum white with grey-blue panels, and some relief of bronze and gold in the mouldings. The doors and other work here and throughout are of oak, once French polished, but now bared of polish, brought to a natural surface of quiet tone, and wax rubbed, the mouldings being gilt.

In the grand staircase the red is continued up to the gilt string course on the first floor level, the niche in which Walworth's statue is placed being gilt, as also are the metal balustrades throughout. Above this level the walls are panelled as well as being broken by scagliola pilasters and columns, by two doorways, and by a large triple window. In the panels are full-length portraits, the panels and margins being in two low tones of green, divided by mouldings in gold and vellum. The ceiling here is also goffered in square panels, now in quiet, light blue, with gilt centre flowers; and the enrichments of the cross-beams, mouldings, &c., as also of the cornice and architrave, are mainly in bronze and gold. There is a rich maroon ground in the frieze, intended for inscription.

The triple window of three equal lights (originally filled with ground glass and coloured margins) is now glazed with beaded glass, of which the design is expressive of the sea fisheries, the general ground being white, ornamented with sea plants, fish, and festoons of nets, while the borders are formed entirely of seaweeds and crustaceans, all carefully drawn from nature. In the centre of the middle light are the Company's arms and supporters, while on either side are the arms of the former companies of Stock-fishmongers and Salt-fishmongers, which were united in the existing Company in 1535.

The Great Hall, with five windows on the east front, has its ceiling, which rises

on a low elliptic section, also divided into rectangular panels with bold flowers in the centre. These are divided into groups by bold bands of Greek guilloche ornaments, which have been solidly gilt with good effect, as have also the centre flowers, the panels being light blue, and the mass of the ceiling margins and framework being broken white. The deep cornice and frieze are in light tones, with the enrichments boldly gilt, and a dull red background to the scroll of the frieze. The scagliola pilasters remain, and the walls are painted in low-toned green as a ground for the pictures, whilst between the bronze and gold capitals of the pilasters, and close under the frieze, are ranged the interesting series of old carved and gilt shields which

## NOTES ON EDINBURGH ARCHITECTURE.\*

BY THOMAS ALLAN CROAL, F.S.A. (Scot.)

WHILE I must not discuss the weary question of a site for the Usher Hall, I have to notice that, as regards the site chosen, the report by Mr. Waterhouse deals with the two points which I had in my mind when settling the subject of this paper. I am to speak of the "Placing of Buildings," and of the exits and entrances of public places. Now what does Mr. Waterhouse say about Atholl Crescent? After admitting that

ELGIN CATHEDRAL. INTERIOR OF CHAPTER HOUSE. (See page 19.)

commemorate the arms of the Prime Wardens from early in the seventeenth century. The woodwork here, as elsewhere, is of wainscot, now freed from polish and with the mouldings gilt; and a dado of similar wainscot panelling has now been added to connect the rest. A good effect is obtained by making the walls of the Music Gallery of a dull red. It is to be regretted that the old inharmonious and ill-designed heraldic windows of the two end clerestory lights have been allowed to remain with the new decoration, with which they are necessarily discordant. The electric lighting has been carried out by Messrs. Verity, of Regent Street, and the whole of the decorative works by Messrs. Crace, of Wigmore Street.

it "presents, in some respects, an attractive site," Mr. Waterhouse proceeds to say, "I think I need hardly point out that the north is the worst possible aspect for a beautiful work of Architecture." He then speaks to this effect that it would be difficult for the public to approach the hall, and that if the hall is made capable of holding an audience of nearly 4000 persons, "that would be a serious disadvantage." First, then, with regard to the placing of buildings. In what way will "a beautiful piece of Architecture" (to use Mr. Waterhouse's words) be best

\* A paper read before the Edinburgh Architectural Association on Feb. 8th.

placed so that its beauties may be fully appreciated? And, second to that, what illustrations in the way of teaching and warning has Edinburgh to give us? The formula is very short—"Place it in the sunlight." Or, if more is required, let me quote Mr. Waterhouse again: "It should be more or less surrounded by lawns and trees, as nothing, in my humble judgment, so much enhances the enjoyment of fine Architecture as the softening influence of neighbouring vegetation." "Placed in the sun," and "surrounded by lawns and trees"—how many buildings in Edinburgh answer to those two requirements? Doubtless the demand for trees and lawns is, within a city, a counsel of perfection. The space is often not available, and in many places trees and lawns will not grow. But in Edinburgh we have had space enough, and, although Lord Cockburn long ago laid it down as an axiom that there was nothing an Edinburgh architect or builder hated so much as a tree, yet they will grow if we give them a chance. "Placed in the sun." Is not this the secret of the beauty to the eye presented by the General Register House? The suavity of tone of that building grows year by year—it is a thing of beauty and remains a joy for ever. No doubt part of this is due to the grace of line and dignity of detail in the building itself. But much is due to the site—that is to say, that the front and principal feature basks in the sun—the building is best seen on its own proper front. Here, no doubt, the lawns and trees are necessarily absent. But let us take another instance, from the same architect, and ask ourselves whether the north side of Charlotte Square—that group of houses which Edinburgh architects and Edinburgh taste have declared they "will not willingly let die"—not even for the Usher Hall!—whether this range of houses does not owe some of its charm to the combination of a sunny frontage and "the softening influence of neighbouring vegetation?"

#### The "Right" and the "Possible."

In seeking further into this matter, we must not be unmindful of the aphorism Mr. Ruskin puts in the forefront of his "Seven Lamps of Architecture." He gives, as the rubric for his initial paragraph, the following:—"Aphorism I. We may always know what is right, but not always what is possible." He then speaks of the consideration of the "doubtful, and in some sort, inexplicable relations of capability, chance, resistance, and convenience as preceding, or even superseding, the determination of what is absolutely desirable and just," and says it is no wonder that "sometimes the too cold calculation of our powers should reconcile us too easily to our shortcomings." Seventy years ago Mr. John Britton collaborated with Mr. Thos. S. Shepherd to produce their well-known series of views of Edinburgh. The "critical" illustrations promised in the introduction deal only with praise, and the views, with a perverseness to my mind almost criminal, show many of the north fronts in a blaze of sunshine, while one building, which evermore basks in what sun we have, has its front thrown into shadow! Several buildings—as instances, the University and the Physician's Hall, formerly on the site of the Commercial Bank—have the sun on them such as we could only see about four a.m. at midsummer, and so we must believe that seventy years ago we were much earlier risers than now, for the streets are in each case thronged with fashionably dressed ladies. They might, of course, be going to "morning concerts!" I have in my possession two works on Architecture professing to say something about choice of site, one published about 1730 and the other about 1830. In the latter book, except an exclamation to be quoted later as to the burning of London, I find nothing germane to my subject. In Mr. Robert Morris' somewhat pedantic lectures on Architecture, delivered before the Society of Arts in 1730-34, a very few words are to be found in connection with my subject.

#### The Scott Monument.

What are the buildings in Edinburgh which suffer in effect because of their position as

regards sunlight? Will you be surprised if I name first the Scott Monument? That it is an ornament to Princes' Street; that it is in itself a choice bit of work; that it is a notable memorial to a notable man, and appropriate in design for such a man—all these things may be freely granted by all. But they do not touch the present complaint, which is that the structure is so placed that it is not seen at its best in front. I have viewed the monument under all circumstances—morning, noon, evening, and midnight, and from all sides, and the conclusion is that from the front it looks least admirable of all! There was a time when for a few months I went to business at 4 a.m., and though that is nearly forty years ago, I have the most vivid and delightful memory of how the Scott Monument looked in the full moon with the city lying deep in the virgin snow. From the North Bridge it is needless to look at details, and as the Monument stands "four-square to every wind that blows," the fault I now point to was not then discernible. It was then simply a rarely beautiful sight, one of many seeming marble palaces set, for the time, "in pictures of silver." The best view of the Scott Monument is to be had in the late afternoon from the south-west, and even at this point we must go from detail to general. If then the present site was—in Mr. Ruskin's words—the best possible, it can only be a living regret that the "right" and the "possible" fell so far asunder.

#### What Might Have Been.

If I am asked "where would I have put it," I might decline to answer, for "This Sixty Years Since" the site was chosen, and what is done cannot be undone. But I might make one suggestion. Suppose the (then) mean houses in Princes' Street, from St. Andrew Street to St. David Street had been removed, and a crescent-shaped row had been built, the Scott Monument might have been placed in the semi-circle, where it would have looked its best, facing the sun, and thus *best seen by those passing in front of it*. By such a course, another objection recently brought to my notice would have been obviated. I had recently through my hands, in preparation for the press, a work on a notable era in Scottish history by a most enthusiastic American, a man well learned in Scott and Scotland. He asked, in a chapter dealing with Edinburgh, why Scott was placed with his back to the Old Town he knew and loved so well, and his face to the New Town and the triflers of to-day? I am not able to say whether this complaint will ever see the light in print, but I said to the writer "You would not propose to turn the statue round now would you?" and his reply was an emphatic "I would turn it round to-morrow if I had the power."

#### Other Ill-chosen Sites.

Let me proceed to point out a few additional cases. There is the University, so hemmed in on its front and its sunny side that it can never be seen, and with only its plain and grimy north side laid open to view. You have to go inside to see its best front!—in this perhaps it resembles Trinity College, Dublin, where such an Irishism is more at home than with us. There is Heriot's Hospital, which has had its front door at the back all my lifetime, but which formerly was entered from the north. There is the Royal Infirmary, but the position of the administrative front is here perhaps excusable, because the pavilions must have the sunny side. There is the Museum of Science and Art, carefully provided on the wings with a heavy cornice to keep off the sun that never shines and the heat that never comes, and in the centre an open glass front to the cold north! Supposing the last case to have been inevitable—the only "possible" and therefore, in spite of Ruskin, "right"—why are the new University Buildings and the Students' Union found now repeating the same error? For it may be accepted as axiomatic that the best view of any building should be obtained from *its own proper front*, while it is almost true that the vast majority of our public buildings are worst seen when we stand directly in front of them. And

then so few are "true all round," like that sailor's tartan waistcoat, or like Heriot's Hospital, which has a complete front each way. If we take Fettes College, it is so grandly placed that the slight "sluminess" of its rear view does not offend. But how many buildings do we see whose back elevations, although on the sunny side, are of such bald style as only to show a deformity? Professor Blackie described the aspect of Barclay Church from the south as like "a herd of elephants and rhinoceros, with their hind-quarters towards you." But some of our buildings show not even the natural contours of a rhinoceros.

#### R. L. Stevenson's Protest.

It is perhaps notable that such of our critics as notice the subject often dwell upon the error made in laying out the earlier New Town. In the "Picturesque Notes" of R. L. Stevenson is found the following:—"If he (the architect) had so chosen, every street upon the northern slope might have been a noble terrace, and commanded an extensive and beautiful view. But the space has been too closely built; many of the houses front the wrong way, intent, like the Man with the Muck Rake, on what is not worth observation, and standing discourteously back-foremost in the ranks; and, in a word, it is only from attic windows or here and there at a crossing that you can get a look beyond the city," &c. Now Stevenson has elsewhere in the same volume dilated on the surprises of the views from streets and houses in Edinburgh—I refer to the chapter where the words occur "you look down an alley and see ships tacking for the Baltic" and although the sentences are not exactly contradictory, they are sufficiently at variance to embolden one to criticise the first quotation.

#### A Dismal Street.

If the northern slope of the New Town had been laid out in a series of Queen Streets, would matters have been improved? Is not Queen Street so deadly dull and damp and cold, that (although it fulfils Stevenson's demand in not "fronting the wrong way") its only effect on Ruskin was to make him count how many windows it had the same! Here was the man with the muck-rake indeed, who only saw the dark side of the matter, and did not raise his head to the grand northern outlook. Contrast it to-day with Abercromby Place, whose fine frontage basks in the sun, and whose attic windows must enjoy all the grandeur of scenery on which Stevenson dwells. It is quite as plain, architecturally, as Queen Street, yet ask "the man in the street" about the two, and listen to the praise of the one and the disparagement of the other. Or take Moray Place, and that group of squares and streets, and contrast the feelings of those living in houses on the south side, fulfilling as these do R. L. Stevenson's idea of facing the grandeur of the Highland view, with those "fronting the wrong way," but having sunshine on their doorsteps—a sunshine Stevenson thinks "not worth observation." I fear that Cockburn's dream that "after many years," and at "the cost of building more than half of the New Town" over again, these evils might be cured, cannot be realised. I read the other day in Mr. Goodwin's book of a man who said, "Heaven be praised London was burnt;" and as it has taken 200 years for people to start on that revival of Architecture which is the feature of London in the past twenty years, I do not ask to have Edinburgh burned—"My soul, that would be a bleeze," as Bailie Nicol Jarvie said—but without this I fear the older New Town must remain, with its dark, damp Queen Street and the south sides of Northumberland Street and the rest. The point meets one at every turn in Edinburgh that the badly-placed building, however fine architecturally, loses in estimation as against even an inferior building in a better position. Contrast the Heriot Watt College with the Museum of Science and Art opposite it and already referred to. Contrast the Commercial Bank in George Street with the Bank of Scotland there. Contrast Mr. Waterhouse's red sandstone building for the Prudential Insurance Co. with the structures now

in progress for the Scottish Equitable and the Standard Insurance Companies. I am not asking any comparison or giving any opinion on the architectural merits of these buildings. All I point to is that those with the sunny frontage fill the eye and satisfy the eye in a manner to which the opposite buildings cannot attain. In every view we can take of the question we reach the conclusion that Princes' Street—although it is, or, perhaps, because it is, as the Glasgow man said, "a street wi' yae side"—embodies the perfection of conditions for prominent town Architecture. The varied aspects of the houses there may present features now and again which make the judicious grieve; but what a grand terrace it is, and how completely does it control the life and heighten the picturesque fame of our city! So far from joining with those who would have made our northern slope a series of Queen Streets, I would rather have it—if change were yet possible—a range of terraces with no south side houses. This may seem a dream indeed, but if the present condition of Queen Street and Heriot Row be examined and contrasted, not merely from the street Architecture point of view, but from the popular and residential point, there will be found a strong body of opinion in favour of what is here suggested. As regards the adverse effect of shadow, contrast the two sides of York Place, where on the shady side the unique example of Adam's work, St. George's Chapel, almost escapes notice, its characteristic features and quaint details being almost unknown. I do not plead for an absolute south front in every case, and I may illustrate this by what seems to have been a possibility which the designers of our rectangular New Town threw away. I refer to "Gabriel's Road." The line of this road can still be traced on the maps, stretching diagonally across from the Register House on the south-east to Glenogle Road on the north-west. We trace it first in the passenger roadway bounding the Café Royal and the triangular space west of the original Register House, then we catch its

these may perhaps be pleaded in defence of building the two rows of houses. But the ground was cheap—or should have been cheap then—and the only loss would have been that Heriot's hospital might have been somewhat the poorer to-day, while there would have been the threefold advantage of a lesser death-rate—for all authorities say "show me your population per acre and I will tell your death-rate"—better gradients for our horses and our hearts!—and the possibility of saving us from the absurdly antiquated cable tramway! Might we not also, by

am dealing specially with the placing of buildings, it is with great pleasure I find, from a recent speech of the Lord Provost, that neither the Commander-in-Chief nor the War Secretary is satisfied with the latest building within the Castle. What their objection may be I know not, but mine is that, as these buildings fall into the outline as viewed from the north, they intrude upon and spoil what was formerly a most lovely and perfect contour. The Castle at that point was to my mind a kind of inspiration in form, affecting the mind with an idea of perfection just as

R.I.B.A. PRIZE AWARDS: THE TITE MEDAL AND 5 GUINEAS. DESIGN FOR A ROYAL MAUSOLEUM. CROSS SECTION. BY ALEX. M'INNES GARDNER.

memory in that right of way we have through the Royal Bank grounds, then we see it in the stunted and sloping lines of some of the back gardens in Duke Street—very probably also in that dispute as to the ground which gave Abercrombie Place its crescent shape—and so through Silver Mills to Henderson Row, where after a detour we actually pick up the name "Gabriel's Road" at its northern end. One result of the rectangular plan was to give us the steepness of Duke Street and Hanover Street and Howe Street. If the line of Gabriel's Road had been chosen rather, giving sweeping lines and easier gradients, with sunny level terraces branching off, might not our new town have been very different to-day? One advantage of the double streets we have perhaps in wide roads, and the expense of

following natural curves and getting rid of right angles, have done better with our trees, and enjoyed, to a greater extent, in our streets "the softening influence of neighbouring vegetation."

In a question of the placing of buildings, the effect of a little distance and a wider view often compensates somewhat for the absence of a well-lit frontage. This applies, of course, rather to a range of buildings than to the individual structures composing it, and perhaps the finest illustration of it the world has to show is found in that "ridgy back heaved to the sky," on which the image of Scott is so unhappily made to turn his back. We should be very jealous of any interference either with the mass, the line, or the detail of that wonderful and unique spectacle. As I

that grandly-shaped hill Craig-Dhu, as seen from Kingussie, fills the mind with a sense of beauty from its mere outline. And now comes this new structure, obtruding like a snag-tooth in the mouth of a pretty woman, or like the warts and horns on the snout of a rhinoceros. How it is to be mended I know not, unless some further building is set in between the new and the higher houses so as to restore something of that natural grace, the "dying fall" of the previously existing outline. On the direct profile from the north even the new guard-house stands apart and spoils the general effect, but as this is only seen from one point, and the spectator can get rid of the feeling by a slight shift of ground the defect is not serious, and we may be glad of the nice new structure, even with

the solecism of flanking the drawbridge with loopholed walls for defence and then providing a wide and defenceless cart entrance along-side!

#### A Case for Vigilance.

Time will not permit me to follow the details of the Old Town ridge "all the steep slope down," but I would say, let us watch every movement very narrowly, so that no more "buck-teeth" may grow up, and that no more good teeth may be broken out to spoil this grand outline. There are, or were, some fears for St. Giles' "Imperial Crown" being dimmed or dwarfed by the new buildings of the City Chambers, and the North Bridge building outlines must be jealously watched by the Association. But it is satisfactory to know that this attitude of the Architectural Association, and the higher regard in civic minds to questions of the beauty and dignity of Edinburgh, combine to give us some assurance that what is done will prove to be, as Ruskin might say, acts of virtue, and not acts of vice and shame.

#### The Ground Line.

There is just one other point in regard to the placing of buildings to which I would draw attention—that of raising them from the ground line. I find Cockburn saying of the Royal Institution that "the building, though pleasing, is not what it ought to have been. It should have been set on a higher table." Strictly speaking, Cockburn is no doubt right. But, although the building has the usual Edinburgh fault of having its front with the worst aspect—especially as it faces a slope!—and it is true that a Grecian temple has its best site upon an eminence, yet I think the Royal Institution justifies itself, even on the low "table" from which it rises, and to this result the fact that it stands high above the adjoining valley, although not high above the street, no doubt materially contributes, as probably does also the "influence of neighbouring vegetation." If the Royal Institution, and the National Gallery behind it, escape censure, this can only be because they happen to fall into a wholly unique and picturesque grouping, and that any necessity to assert their proper classic dignity is negated by their surroundings. The most fortunately placed building in Edinburgh, as regards the "table" on which it stands, is probably Heriot's Hospital, and there are so few notable sites like this that one would almost have hoped that one of them—say the Cattle Market, or St. James's Square (swept and garnished), or the disputed Castle Terrace—should have been secured for Mr. Usher's gift.

#### Advice to Architects.

What, you will say, do I propose as the conclusion of the whole matter? Well! I would almost say to an architect, study site and frontage rather than style. Our robust secretary for Scotland said the other day at Dundee that he would rather have a bad law well administered than the best law ill administered. Perhaps this has to be taken with a grain of salt, yet it has salt in itself. I would rather live in a plain house so situated that everyone coming to the front door would say "how charming this house is," than live in the most brilliant achievement of the architect, so placed that the remark would be "a nice house, but what a pity it is so badly placed;" or, "why was not the entrance at the other side?" If it is said, "how can this be applied when a design is wanted for a building on the dark side of a street?" My answer might be, "that is not my business," and the architect must see to it, and here some of the words of Morris, already quoted might be recalled, where he says "the first care . . . is the justly appropriating the design to the situation. Might it not be wise, for example, on a north front, to avoid cornices and verandahs for the sun that never comes, and to let all details be broad and grand in those elevations where lesser beauties would be thrown away? Try so to suit style to an inevitable site that no one will remark that the house is on the shady side!"

A public statue to Dr. Berry is proposed for erection in Wolverhampton.

## ORNAMENT.

By PROFESSOR BANISTER FLETCHER.

A LECTURE on "Ornament" was delivered at the Carpenters' Hall, London Wall, on February 6th, by Professor Banister Fletcher. Mr. Joseph Preston, Master of the Carpenters' Company, presided. The Professor said it was always of practical value as well as pleasing to endeavour to find out the origin of one's subject, and he thought it might safely be said that the origin of ornament was due to two causes, geometrical forms and natural foliage and flowers. Firstly to deal with the earlier cause, the geometrical; at least it was believed to be the earlier, for it was difficult to disagree with the German Professor Meyer of the School of Applied Art at Karlsruhe, who said "Geometrical ornament is the primordial or oldest of the elements of decoration. The implements of savages, and the tattooing of the Indians prove this. The seam, with the thread running slantwise from one piece to the other, may have been the original for the zigzag line; and the woven work of warp and woof (of every kind), the original for reticulated patterns; and the plaited hair that of the plaited band."

#### Geometrical Ornament.

Perhaps the most pleasing of the geometrical styles was the "Fret," which never seemed to tire the eye. Now this ornament, though apparently complicated, was in reality most simple. The next example from geometrical origin was the bead or astragal, a small semi-circular moulding, so called from its resemblance to a row of knuckle-bones placed side by side. The origin was the necklace of the woman. The next simple form of arrangement was the arrangement in squares. The formation of the apparently difficult band ornament, the "Guilloche," a series of interlaced ornaments on stone resembling network, was simplicity itself. Simply make a series of circles at equal distances and then draw diagonal lines and round them off. The speaker next treated of the wave arrangement. If it was desired to see the extent to which geometrical ornamentation might be carried, so that it decorated the entire surface of the building, one must see the Moorish buildings, and he instanced the Alhambra.

#### The Natural Style.

The Professor then passed to the second class of ornament, namely, that based on Nature, and he stated that in scarcely any instance was Nature actually copied. In Greek ornament on mouldings the outline of each enrichment in relief was ordinarily described by the same line as the profile of the moulding to which it was applied. The acanthus had been more used than any other, although it had never had any symbolic meaning. As time went on the acanthus became more and more conventional, until practically no trace of natural leaf was left. Every style of Architecture had used this plant. The vine was much less often used than the acanthus, although it had symbolic signification in connection with Bacchus.

#### The Right Use of Nature.

The Professor then considered the question: Is the architect wise in varying natural objects, or should he, like the painter, be content with copying? The ornament of the past styles had been splendid, and he thought the reason was not far to seek. Nature did not make her foliage, her fruit, her flowers in stone, nor did she place her delicate buds isolated and at great heights. The architect had to do this—to make his stone or brick building his background, and therefore make his ornament assimilate to some extent with his brick or stone surroundings. Nature had a far different background—green hills, flowing streams, and that charm which no "copying" in stone could possess; its objects were instinct with life, swaying and bending

to the wind. The architect's ornament, on the contrary, was for ever fixed—part of the building—and must be looked at in conjunction therewith.

#### Ornament in Relation to Architecture.

If the Architecture of one's building be bold and masculine then he suggested the ornament should be bold and masculine also. Think of the opposite treatment; carve the daisy or the violet on the frieze of such a building, and how incongruous, out of place, one would pronounce it. He laid some stress upon this part of his lecture, because (1) there was a school arising whose theory or opinion was that the natural treatment of ornament in Architecture is the true one; (2) because ornament must play a most important part in any new style of Architecture, and, therefore, it was most important to consider what its character should be. After quoting authorities in support of his conclusions, the Professor went on to show a few more examples of the application of ornament to the different features in the different styles of Architecture of the past.

#### The Limits of Ornamentation.

Next to proportion and grandeur of form in a building came architectural ornament, which might no doubt be used to excess. It should be confined to the decoration of the constructive parts of the fabric. The old writers said that ornament might be compared to jewels, and just as they should be sparingly used in the decoration of the person so should ornament be used in a building, but it must not be forgotten that a paucity of ornament betokened an unpleasing poverty, and a total absence deprived the building of a right to be classified as Architecture—it was mere building.

## COLOUR EFFECTS.

A SINGLE plaster cast, if it be really artistic, is far to be preferred to a piece of marble statuary poorly executed, and besides that, a person with taste can absolutely revolutionise a house by employing the right colours in the right place. Many persons seldom or ever dream of the many possibilities which can be obtained from a judicious employment of colours. There are tints and tones that are refreshing and broadening, others that absorb light and give a boxed up appearance to a room, others that make a room with a bleak northern exposure, or with no exposure at all, appear bright and cheerful; some that make a room appear warm, and some that make it cold. The thermometer seems to fall quite half a-dozen degrees when you enter a blue room; yellow is an advancing colour; therefore, a room fitted up in yellow will appear much smaller than it is. On the other hand blue of a certain shade, introduced somewhat generously, will give to a room an idea of space. Red makes no difference in regard to size, and green makes very little. If a bright sunny room gets its light from a space obtruded upon by russet coloured or yellow painted houses, or else looks out upon a stretch of green grass, it should be decorated in a colour very different from the shade chosen if the light comes from only an unbroken expanse of sky. Red brings out in a room whatever limb of green lurks in the composition of the other colours employed. Green needs sunlight to develop the yellow in it and make it seem cheerful. If olive or red brown be employed in conjunction with mahogany furniture, the effect is very different from what it would be if blue were used; as this would develop the tawny orange lurking in the mahogany. If a ceiling is to be made to appear higher, leave it light so that it may appear to recede. Deepening the colour used on the ceiling would make it seem lower, an effect desirable if the room is small and the ceiling very high. Various tones of yellow can be well employed as substitutes for sunlight. The above hints may be of use, to some of our younger readers at any rate.

W. N. B.

## FACTORY DESIGN.

By J. H. PEARSON.

A JOINT meeting of the Institution of Junior Engineers and the Discussion Section of the Architectural Association was held last Friday evening at the Westminster Palace Hotel. A year ago a meeting of a similar character was held, when the engineers were the guests of the architects. The present meeting, which was, therefore, in the nature of a return visit, was in every way a success; there was a good attendance, a capital paper, and a brisk discussion, and it is likely that in future similar joint meetings will be held at least annually. The chair was taken by the chairman of the Institution of Junior Engineers, Mr. Basil H. Joy, who in his opening remarks referred to the new departure as one which could not fail to be of great benefit both to the architects and the engineers. Members of the Institution desired information on matters outside their own particular practice, and he hoped that this meeting would inaugurate a long series of joint meetings, which might eventually develop into united meetings with other kindred societies. Mr. J. H. Pearson, M.I.E., then read a paper on "Factory Design." At the outset the author referred to the relationship between

### Architect and Engineer.

An engineer was often found doing work requiring the supervision of an architect, and *vice versa*, sometimes with unsatisfactory results. United action was necessary, and the respective duties of architect and engineer should be clearly defined, and each should be responsible for the work under his control. The procedure he suggested in the case of the building of a factory was that the architect, having all particulars of the building site, should ascertain from the engineer the kind and weight of machinery to be installed, the space required for it, and the minimum height to be allowed for floors. The architect should then prepare his sketch plans, and furnish the engineer with tracings, together with any skeleton sections likely to prove useful. The engineer should then indicate on the tracings the positions in which he proposed to fix his machinery and give a copy of it to the architect, together with particulars of any special construction or preparation necessary for the reception of the machinery.

### Choice of Site.

Mr. Pearson proceeded to point out some considerations which should govern the choice of site; preference should be given to one near a railway or canal, and in a neighbourhood likely to supply a desirable *employé*. The requirements of the London Building Act, or of local by-laws, must, of course, be considered. The design of the factory would depend upon its situation, the size of the building site, and the nature of the business to be carried on. Three types of factories were mentioned: (1) The light class, for textiles and such trades as cabinet-makers, jewellers, and box manufacturers; these were generally constructed in several floors. (2) The heavy class, suitable for engine and boiler makers, breweries, distilleries, &c.; these had only one or two floors. (3) The combination of warehouse and factory in one building; in these there were usually five or six floors. The various methods of deriving power for machinery were then explained, as these would affect the design.

### The Elevation.

Mr. Jackson was not of opinion that a factory must necessarily be ugly. The exterior should be bold in outline and designed to give the passer-by the impression of solidity and strength. A good architectural effect might be obtained by the use of parti-coloured bricks, and the entrances and any special features of the building should be emphasised. Stonework, as a rule, should be sparingly used, as it would not stand an excessive heat. Some of the patent stone compositions were cheaper, more durable, and more fire-resisting.

After describing in detail the various kinds of material it was desirable to use in factory construction, Mr. Pearson spoke of

### The Foundations.

Where great weights had to be carried, and the soil was of a soft nature, it was desirable to employ a continuous and substantial bed of concrete over the whole site, in order to obtain uniform pressure; but where the bottom was of hard sand or gravel the excavations might be confined to trenches for walls and potholes for piers and columns. In buildings near a river bank where the soil was of a soft character for a great depth piles might be used. These should be driven in groups at intervals, beds of masonry being placed on them, and brick arches turned between the piers to carry walls above, continuous iron tie-bolts being inserted all round the building for tying in the masonry and brickwork immediately above the piles. The best methods of flooring and roofing were then discussed, and the correct method of setting out a Queen post roof truss was illustrated by a diagram.

### Windows and Skylights.

It was suggested that the best form of window was that having the upper sash hinged to fall inwards or hung on pivots, allowing the fresh air to enter over the heads of the workpeople. A skylight constructed with one glazed and nearly vertical slope facing north, and the other pitched to an angle of about 35deg., boarded and covered with slates or lead, was suitable where a northern light was essential; but where more light and ventilation were required the lantern form was to be preferred. The requirements in designing chimney shafts were next dealt with, and it was pointed out that circular shafts offer the least resistance to wind; but for a small chimney of this shape it was recommended that special curved bricks should be made, so that a smooth surface might be presented, and the vertical joints might be of even thickness.

### Ventilation and Warming.

Natural ventilation should be adopted as far as possible, and was usually sufficient for warehouses or for small non-textile factories where no impure gases or dust were generated. The author was of opinion that large factories, whether textile or non-textile, could only be efficiently ventilated by artificial means; either the plenum or vacuum system might be used, or, in some cases, the two might be combined. The temperature required for factories was about 55° F., so that in cold weather some system of heating was needed. Buildings might be heated either by hot water, steam, or hot air, besides the open fireplace. Where waste steam was available, this could be economically applied for heating purposes. Steam radiators occupied less space than hot air apparatus and steam had practically the same temperature throughout the building.

### Sanitation.

All parts of the building should be lighted, where practicable, directly from the exterior, and there should be a plentiful water supply. Drainpipes should be laid in straight lines, with inspection chambers at junctions, to give facilities for inspection and cleansing. The pipes might be either of stoneware or cast iron; if the former, they should be jointed in cement and embedded in concrete, and all drains should be provided with an inlet and outlet pipe to carry a current of fresh air through the whole system of drainage. In chemical works, where it was necessary to flush the floors, provision must be made for carrying away the water. All sanitary fittings should be simple, strong, and not likely to get out of order. The best system of lighting for factories was by electricity. The lecturer concluded by explaining a number of plans and other diagrams bearing upon his subject which had been placed upon the walls.

### Points from the Discussion.

The paper was followed by a long and interesting discussion, which was opened by the reading of a communication from Mr. M.

Garbutt, and continued by speeches from Messrs. P. J. Waldram, E. Pearson, T. C. Morewood, H. H. Statham, W. W. Beaumont, T. C. Reid, H. J. Leaning, H. J. Young, E. A. Berry, Max Clarke and W. R. Beckett. In the course of the discussion a great many points of detail were touched upon, amongst others the relative values of various fire-resisting constructions. Several speakers expressed their preference for wood floors, and Mr. Statham gave the results of some fire tests made some three years ago in Germany, when the best records were obtained by a wooden floor. Are factories necessarily ugly? Some were of opinion that in buildings so essentially practical any attempt at architectural adornment would be out of place, but examples were mentioned of existing factories that were not without picturesque qualities, and Mr. Statham pointed out that in America even high chimneys were often treated in a picturesque way without any loss of their utilitarian character. As Mr. Leaning remarked, the great difficulty was to get the public to recognise that anything more was necessary than bare utility. People would say that the neighbourhood was not good enough to warrant anything in the shape of ornament, but he maintained that no neighbourhood was so bad that it could not be improved. On one point there seemed to be a consensus of opinion, viz., that a more intimate association between architects and engineers was in every way desirable. Some striking examples were given of the disastrous consequences that sometimes attended a want of co-operation between the architect and the engineer. The former would build his house apparently without any regard to the machinery that was to be put into it, and would be much annoyed when the engineer began to knock holes in it in order to fix his machinery. A case was mentioned of a metal plate works where the moulding shop was placed the whole length of the factory away from the pattern shop. This arrangement, due to the architect's desire for a symmetrical building, involved the firm in an expense of over £200 a year more for labour than would have been necessary had the two shops been placed together, as they should have been.

**Building in Aberdeen.**—At the meeting of the Plans Committee of the Aberdeen Town Council on Friday, twelve sets of plans for new buildings, and alterations on existing buildings were submitted, the total value being £18,000. The plans included those for new buildings for the Scottish Temperance Assurance Company, to be erected at 154, Union Street, at a cost of £5000; for a boot and shoe factory in Leadside Road, for Mr. Lewis Morrison; and for a bakery and dwelling-house in George Street, fronting the House of Refuge, for Mr. A. B. Hutchinson, baker, Broad Street.

**The Edinburgh Architectural Association** paid their first visit of the Session on Saturday, to Tollcross Cable Power Station, by kind permission of the Lord Provost and Magistrates. The members had shown and explained the boiler house, with its boilers with feed heaters, super-heaters, economisers, coal hoisting machinery, mode of storing coal, and feeding furnaces, chimney stalk; the engine house with its engines and rope drives, overhead travelling cranes; the mode of conducting cables to their respective routes; the c-r stables, and the auxiliary cable arrangement for taking in and out cars; the workshop and stores, the general design of the station. The leaders were Messrs. W. Newby Colam, M.I.C.E., and John Cooper, Burgh Engineer. The party then visited the Edinburgh Industrial Brigade Home, Fountainbridge, by kind permission of Hamilton Maxwell, Esq., W.S., hon. secretary. There they were shown the entrance hall, dining hall, kitchen and offices, heating chamber, laundry, bathrooms, and lavatories, large hall, dormitories, and dressing rooms, play and reading rooms, erection room, and superintendents' and matron's houses. The leader was Mr. Frank W. Simon, architect.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### BAKERIES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you inform me of any recent work on Bakeries? or where I could get reliable information about them? Thanking you in anticipation.—Yours truly,  
Birmingham. F. W. A.

There are, we believe, no books published on Bakeries, and information on the subject seems difficult to obtain. Perhaps some of our readers could oblige.

### BOOKS ON SURVEYING AND SEWAGE TREATMENT.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May I trouble you to kindly inform me the price of the works you mentioned in the BUILDERS' JOURNAL of January 25th, and where obtained, viz., Amstie's "Comprehensive Treatise on Surveying"; Castle's "Treatise on Land Surveying and Levelling." Also, is there any recent work on Bacterial Treatment of Sewage.—Yours faithfully,  
Isle of Wight. W. I. W.

The books mentioned above are out of print. Mill's "Practical Surveying," price 7s. 6d., published by Batsford, 94, High Holborn, can be recommended. Moore's "Sanitary Engineering," 30s. nett., gives information on the Bacterial Treatment of Sewage. Any bookseller will obtain these books to order.

### BOOKS ON DESIGN AND LAW.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Would you kindly inform me through your Enquiry columns the best work on Architectural design for a student, dealing with buildings only? I have seen such a book, but have forgotten the name and price. Also, do you know of any digest of Law cases in a handy form for buildings and building law only, such as cases appealed under P.H.A. bye-laws, rights of light, easements, &c.?—Yours, &c.,  
Hexham. W. M.

We can recommend "Treatise on Principles of Design in Architecture," by E. L. Garbett (Lockwood: 2s. 6d.) Perhaps that is the book to which you refer. The "Architects' Compendium" publishes yearly an epitome of decisions in the courts, which, during the past year, have affected the interpretation of the various Acts relating to building. We may also refer you to "The Architects' Legal Handbook," by Messrs. Jenkins and Raymond, and "Digest of Building Cases; and addendum," by E. S. Roscoe.

### DISTRICT SURVEYORS' EXAMINATION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Being a subscriber of yours since the start, I trust you will, through your Enquiry columns, give me sound advice on the following: I am thinking of studying for the Exam. under R.I.B.A. for Building Surveyors (London). Could you give me an idea of the scope of the work? What books do you recommend, and how long would it take to work up? Also please give age limit and any further information. I have written to the Institute, but their information is very narrow indeed.—Yours, &c.  
Dartford.

"SURVEYOR."

Enquiries addressed to us in this column should be explicit and practical. How are we to tell you how long it will take you to qualify for any particular test? We understand you desire to take part in the examination of the

R.I.B.A., qualifying for candidature as district surveyor in London. In that case you must write to the Secretary, R.I.B.A. for his current issue of the "Kalendar" (price 2s. 6d.) and the application forms relating to the examination (free): The "Kalendar" gives a detailed epitome of the scope of the examination. A thoroughly sound knowledge is expected of examinees, such as an experienced practitioner should possess. The examination is of a practical nature, and apart from this it would be impossible to advise you as to books without knowing what your present standing or qualifications are.

### SELF-INSTRUCTION FOR SANITARY INSTITUTE EXAMINATION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I shall be glad if you can recommend me the most suitable books for a course of drawing by self-instruction (if you think this possible). Being out of the way of attending any classes or obtaining any lessons, your kindly help will much oblige. The idea is to take a course, say as follows: (a) Free-hand. (b) Model and sketching from nature. (c) Perspective. (d) Geometry. (e) Shadows, reflections, and projections. (f) Building construction. (g) Machine construction. Would the following be of any use: (a and b) Vere Foster's Series. (c) Swinstead's "Perspective." (d) Carroll's "Geometry." (e) ? (f) Burrell's "Building Construction." (g) Low's "Machine Construction"? Or can you recommend more suitable works? Should the order of taking the subjects be different? Is it necessary to wade all through Rivington's Course for the Building Construction to enable one to pass the Land Agency Division of the Sanitary Institute, or would Burrell's book or Dobson's "Art of Building" be sufficient?—Yours truly,  
York. STUDENT S.I.

If you are taking the course of examinations of the Surveyors' Institute, you must get the "Rules of Examination" and "Syllabus of Subjects," which suggests the books best studied in each subject, and gives samples of the papers that have been set. As you do not tell us in which division you are we cannot give you specific advice. Apply to the Secretary, Surveyors' Institute, Savoy Street, Victoria Embankment, London, W.C. "Building Construction" (Rivington) is a standard book, and, being progressive, is suited to all students. We strongly advise you to strictly follow the course laid down by the S.I. as you are a student of the Institute. As for the books you mention, you should not use the Vere Foster Series. Read Ruskin's little book on "Drawing," practise freehand from casts of sculptured ornament in buildings, and sketch natural objects. Copy nothing from books. You may, however, learn much by examining the methods of accomplished draughtsmen.

Two new Rembrandts have been added to the collection at the National Gallery. They now hang on either side of the great Van Dyck in the principal Dutch Room. They are numbered 1672 and 1673, and are portraits respectively of an old man and an old woman. They are fine examples of the painter's later style. They were purchased for the nation from Lady de Saumarez, under a special grant of money from the Treasury.

Memorial to Sir John Millais.—At a meeting of the Millais Memorial Committee, held last Wednesday at Marlborough House, it was decided that a statue be placed at the Tate Gallery, as the first proposal to place the monument in St. Paul's Cathedral has been found impracticable. It was further resolved immediately to invite contributions for carrying this object into effect. It is calculated that the amount required is from £1500 to £2000. Subscriptions may be sent to the Bank of England, Western Branch, Burlington Gardens, W., to the account of the Millais Memorial Fund; or to the honorary treasurer, Mr. James Knowles, Queen Anne's Lodge, Westminster.

## Correspondence.

### A PROPOSED TECHNICAL COURT.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The present state of the law with regard to matters of light and air in building operations is one of great uncertainty, and productive of much waste of time and money, and frequently seriously impedes the building enterprises of those wishing to improve or rebuild their premises; and it is very often a question whether it is not worth while to pay a sum of money as blackmail rather than have the progress of the work stopped by an injunction and risk the heavy expenses incurred in fighting an action often based on trivial or even imaginary rights.

How to deal with this question so as not to interfere with vested interests and rights, and yet at the same time facilitate building operations, may be a difficult problem, but it is not by any means an impossible one.

In Scotland these matters are dealt with by the Court of the Dean of Guild, and it ought to be possible to adopt some similar means here. It has been suggested that a technical court should be established, and every building owner, where any question of light, air, or other easement arises, should be able to appeal to this court and cite before it all respondents who may be interested. Plans could be deposited to which all interested parties could have access, and the court would then proceed to hear the objectors and the building owner, and decide the limit to which the building could be carried without interfering with the lights and easements of the objectors. By this means no injury would be done to the rights of either party, and the decision obtained before the building owner is pledged to his contract with the builder would most certainly prove of invaluable service to those contemplating building, and prevent blackmailing or useless actions.

The technical court would be composed of professional men, who would not require expensive expert evidence to be brought before them to determine the issue, and who would visit the premises and see for themselves. The nucleus of such a court is to be found in the Tribunal of Appeal under the London Building Act of 1894; its numbers could be increased, and additional powers given to it to charge the necessary fees for maintenance, and the whole cost of deciding between the parties would be a mere fraction of the present unsatisfactory and wasteful course of fighting a light and air action. There could, of course, be an appeal to the divisional court, if thought necessary, and also the building owner, if he exceeded the limits laid down by the court without first settling with his neighbours, would be proceeded against by the court, who should have the power of enforcing their own decisions.

To this end the Society of Architects, in November last, approached the Lord Chancellor with a petition praying that a Parliamentary Committee might be appointed to enquire into the present law with regard to ancient lights with a view to saving the large amount of moneys being expended in determining the rights of owners with regard to same, when his Lordship intimated that he would give the matter his careful attention.

It is hoped that the hearty co-operation of the leaders of the professions, both architects, surveyors, and lawyers, will be given to obtaining an Act of Parliament to deal with this subject, and thus enable us at least to be on an equal footing with Scotland. The present new Municipal Government Bill should give a good opportunity for forming the necessary court under the central authority, the London County Council.

C. McARTHUR BUTLER,  
Secretary of the Society of Architects,  
St. James's Hall, Piccadilly, W.

Blackrock Presbyterian Church, Dublin, in Mount Merrion Avenue, has just been opened.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
February 15th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

### The Complete Architect.

OUR columns this week bear rather remarkable testimony to the many-sided character of the equipment needed by the architect who aspires to be a master in his profession. In the discussion which followed Mr. Whall's admirable lecture before the Architectural Association on "Stained Glass," some little demur was made to the lecturer's suggestion that the architect ought to have at least a certain degree of practical knowledge of every craft, including stained-glass work, which he has to direct. On the face of it the demand might appear excessive, but in reality—and we are glad to see that most of the speakers recognised this—it is eminently reasonable. Of course, no man could be a master of every craft concerned in the erection of a cathedral or a factory, but this is one of the cases in which a little knowledge is infinitely less dangerous than no knowledge at all.

### Architect and Engineer.

BUT there is another direction in which the architect needs sometimes to widen his sympathies a little. The joint meeting of the Junior Engineers and the Discussion Section of the Architectural Association, held last Friday, was, we hope, an outward and visible sign of a rapprochement that is not by any means confined to the members of these two institutions. Some of the stories told at the meeting of the woeful consequences of architect and engineer working on independent lines revealed a state of affairs that would scarcely be credible if the speakers had not been relating their actual experiences. Here it is not so much, perhaps, a practical knowledge of engineering that is needed, as a sympathy with the engineer and his aims, and a willingness to work in parallel rather than in series, as an engineer might say. On the other hand, there is often need on the part of the engineer of a juster appreciation of the æsthetic ideals of the architect. Such a friendly gathering as that of last Friday is a step in the right direction.

### Taste in Architecture.

THE advancement of architecture and of all other arts depends not alone on the practitioners of those arts. Beautiful objects are not required in an age which is insensible to beauty. We welcome, therefore, every effort that is made to cultivate something approximating to artistic taste in the masses of the people who have been wont to trouble themselves very little about art matters. The writer of the art notes in the "New Age" makes a laudable attempt in his last week's article to interest his readers in the development of architecture. He defines architecture as "the sense of beauty produced by the building-up of a structure in the fittest possible way, having regard to the country and period in which such edifices are required."

**An Opportunity.** THE writer sees signs of progress as compared with the days when the streets near Cavendish Square and Gower Street were built—"a time," he says, "when Architecture was forgotten, when the only thing required was internal comfort and convenience." It is pointed out that a great opportunity for further progress will be presented by the London County Council's new street from Holborn to the Strand. This street, says the writer, "will give an unsurpassed opportunity for architectural effect. It can be pictured in the imagination as one of the finest streets in Europe, if only genuine artistic power is brought to bear, and if, instead of being treated in a piecemeal way, an effort is made to keep a general unity of purpose in the designs." It is an encouraging sign of the times that the non-technical press should begin to concern itself with architectural matters.

### Covent Garden Theatre.

A POST not dissimilar to that held by the late Charles Garnier on the Paris Opera House, has now been created at Covent Garden, inasmuch as the Grand Opera Syndicate has just appointed Mr. Edwin O. Sachs, the well-known architect, to be its general technical adviser on all matters architectural and mechanical. Mr. Sachs, whose monumental work, "Modern Opera Houses and Theatres," was reviewed in our columns a few weeks ago, is—if we understand rightly—not only to have charge of the building or engineering operations at Covent Garden, but will supervise the installation and working of the stage as far as its mechanism is concerned. This, no doubt, practically means that Covent Garden will soon have a model stage worked mechanically, for Mr. Sachs' successful substitution of electricity for manual labour at Drury Lane plainly shows that he favours the application of modern methods in stageland. The appointment augurs well for the coming Opera Season, and Earl de Grey and Mr. Higgins are to be congratulated on its creation.

### An Architects' Outing.

THE first spring visit of the Architectural Association took place last Saturday to the new Carlton Hotel, Pall Mall. Generally speaking, these visits are organised to enable the members to make a study of the interior of buildings in course of erection, which in most cases would be inaccessible after they are occupied, and for this reason alone upon these occasions the exterior detail is not taken into so much account. Since a visit was made to Her Majesty's Theatre in 1897, prior to the opening of that building to the public, the development of the scheme for completing the whole corner block facing Pall Mall and the Haymarket has been followed with much interest. The present work is being carried out under the supervision of Messrs. Isaacs and Florence, to whom the members were indebted for the visit, Mr. Florence conducting the party over the building. Fortunately for the general scheme, the continuation of the façade, as designed by the late Mr. Phipps, has been carried out with an effect which would have been lost if any alteration in the design had been followed.

### A Palatial Hotel.

THE main features of the ground floor, which is arranged and will be completed with all the sumptuousness and dignity usual in a modern hotel, are the *salle à manger* and palm court and lounge. The latter occupies the whole area of the courtyard in the centre of the block, and is covered with a glazed dome at the entresol level, the main approach being from Pall Mall. The *salle à manger* extends the whole depth of the site on the north side from the Haymarket to the Arcade, and has one side open to the court. There are two main entrances, from Pall Mall and the Haymarket. The Pall Mall entrance is in the centre of the block and leads directly into the palm court and lounge, and although the building is at present in quite an unfinished state, judging by

the openings and disposition of the approach, an excellent effect will be obtained upon entering the building from this side; this effect will be enhanced by the natural slope of the site necessitating a change of level which has been taken full advantage of by arranging a terrace about 4ft. high adjoining and in conjunction with the *salle à manger*. It may be interesting to record that the original scheme arranged for this large apartment to be over 30ft. high, and the iron construction and floors were worked accordingly, but latterly this height being deemed unnecessary, an additional entresol floor has been introduced, slung down from the ironwork, which had already been placed in position, and as the walls and partitions had not been rendered, the members were enabled to study the unusual construction of the ironwork. The upper part of the building, which extends up to seven stories above the ground floor, is planned to meet the varied requirements of a large hotel. The contractor for the work is Mr. Henry Lovatt, of Wolverhampton.

### Aberdeen's Byron Statue.

AT a meeting of the Byron Statue Sub-Committee on the 4th inst., Mr. Pittendrigh Macgillivray reported that the amount subscribed does not exceed £1500, and the statue must be of bronze and the pedestal of granite if the work is to endure. If marble is adopted for an open-air site, it will inevitably be required to be put under cover at no very distant date; but not, probably, until it has sustained obvious change from weathering. If a suitable site can be found under cover, marble may be adopted, in which case the statue need not be of such colossal proportions as one destined for a site in the open, and will therefore cost less. If the subscriptions should reach the amount of £3000 or thereby, some combination of Architecture and sculpture might be adopted, in which case the statue, being under cover, might be of marble or gilt bronze, and of reduced proportions. It is often objected to our public statues in bronze that they get dull and black. This condition is simply due to neglect. They need not be allowed to oxidise to such an extent if coated with wax, as a preservative of the surface. If cleaned annually, and the wax renewed, they will keep their original colour as long as may be desired. A motion was then carried that the proposed memorial should, if funds permit, take the form of a statue in bronze on a granite pedestal, and it was decided that the questions of sculpture and site should be deferred till a meeting on Friday, March 3rd.

### Belfast's New Cathedral.

GOOD progress is being made with the bold project of erecting a cathedral in Belfast. The sum collected up to the present amounts to more than £15,000. This is sufficient for the first section of the work, which it is expected will shortly be put in hand. The architect, Mr. Thomas Drew, F.R.I.B.A., in a recent letter thus refers to the proposed designs:—"The plans seem to me to be working out hopefully. I have had the advice of several English architects who are showing wide interest in the adaptation of a Basilican idea of church for modern needs as a movement of progress in church architecture. There is a general approval of the idea that the architectural treatment might best receive suggestions from the examples of early churches of the South of France, whose Byzantine feeling is harmonious with their Basilican plans. It is possible to adopt some of the general suggestions of these very noble churches without following out details which are archaic or grotesque. Mr. Mallows, an artist most familiar with this architecture, has shown particular interest in the project. At his request I have given him sketches, from which he will make an interior. Unanimous opinion is expressed that a special feature should be an imposing central western portal, and the state approach to such an interior should be central and on a grand scale. The duplicated entrances which I last sketched do not satisfy my critics, and I shall at least try to produce an arrangement which will be more acceptable."

### More Cathedral Restoration.

YORK MINSTER, which, as the author of the handbook on York in Bell's Cathedral series quaintly puts it, has already "suffered two serious fires and a restoration," is apparently to "suffer" still further restoration. The Dean of York has issued an appeal for funds to effect much-needed repairs to the building. It is the condition of the external stonework which makes the present appeal necessary. This is in such a state of decay as to threaten not only to impair the beauty of the fabric, but to affect its stability. From the report of the architect, Mr. G. F. Bodley, A.R.A., it would appear that there is enough work to keep a dozen men busy for fourteen or fifteen years, and some £2000 a year would be needed. It is proposed to raise a capital sum of £50,000, the interest of which, added to the amount available from the Cathedral fabric fund, would furnish the necessary expense.

### Aspirations after Beauty.

THE members of the Glasgow Ruskin Society are laudably concerned for the beauty of their native city. They lately addressed to the Town Council a letter which pointed out that "while much had been done by the Corporation in recent years in public works in the city, yet much still remained to do in attaining to the ideal of beauty." We can quite believe it, and we could name other cities of which the same remark might be made. The letter proceeded to urge that it was important that the ideal of beauty should be kept prominently in view not less than utility in the growth of the city; and called upon the Corporation to avoid every violation of this ideal in works promoted by themselves, and resolutely to resist it in those promoted by others. But there have been known town councillors whose "ideal of beauty" is defective; what would the Ruskinians do in such a case? We are glad to see that the letter contained one practical suggestion, viz., that a well equipped department of design should be added to the resources of the municipality.

### Strand Improvements.

THE widening of the Strand by the demolition of Holywell Street was authorised by an Act passed in 1897, but the actual work has not yet begun. A report presented to the County Council by the Improvements Committee suggests the reason for the delay. The Council's Improvements Bill now before Parliament seeks to make provision for the acquisition of property on the north side of Holywell Street. "If the block of buildings," says the report, "between the Strand and Holywell Street be removed before the Council proceeds with the purchase of the property on the north side of Holywell Street, we are advised that that property will become very considerably enhanced in value, and the cost of the new street from Holborn to the Strand will accordingly be much increased. This being so, we are strongly of opinion that it is best not to arrange for the demolition of the block of buildings until the Council's Improvements Bill receives the sanction of Parliament, which will probably be about next July. In the meantime, we are pressing forward the negotiations for the acquisition of all the interests in the property in question."

### Hideous Advertisements.

PROFESSOR BODINGTON, in the course of a recent address to the students of the Scarborough School of Art, made a strong protest against the present mode of public advertising with sky-signs by day and illuminated signboards by night, which make the streets of our towns so hideous. Nor is it the town alone which is disfigured. As the Professor said, it is impossible to go into the country without having the eye offended by appalling schemes of colour—deliberately appalling in order to attract notice for the sake of recommending somebody's liver pills or some nostrum against a sick headache. One may hope that if the Schools of Art throughout the country do their work well, a future generation will refuse to tolerate the sights which daily offend our eyes in this commercial age. For what is the function of an Art

School? It is, as Professor Bodington admirably said, "to deliver the nation from the prevailing insensibility to beauty, which is something of a degradation." One wonders what an Athenian citizen of the time of Pericles would have thought—and said—of our gilded sky signs and gaudy advertisement hoardings.

### Photographic Records.

In Paris the Minister of Fine Arts makes arrangements for the measuring and photographing of houses of architectural or historic interest that are about to be pulled down. As there is no public authority in London charged with duties of this sort, it is satisfactory to know that private enterprise is to some extent supplying the deficiency. Sir Benjamin Stone, M.P., who has been making efforts to secure for the British Museum a National Photographic Record Collection, intends, we learn, to convene a gathering of some of those who are interested in the ancient and decaying buildings in and around London, with a view to informally discussing the possibilities and best methods of securing photographic records of interesting buildings in order to add them to the British Museum collection.

### The Thames Embankment.

It has been known for a long time that the Thames Embankment is about as bad a road as could be found in London. But as it is in ordinary times but little used for vehicular traffic no great outcry has been raised against a state of things which in some European capitals would be regarded as a disgrace. Now, however, that Parliament Street is partially closed, and a large number of omnibuses and other heavy vehicles have daily to plough their way through the thick mud, public attention is being drawn to the matter. At the meeting of the County Council last week Mr. J. Williams Benn, the Chairman of the Highways Committee, stated that some drastic remedy was imperative. It was proposed to relay the roadway with wood blocks on a concrete foundation. This, of course, would be an expensive matter, but anything is better than allowing London's finest thoroughfare to remain the Slough of Despond it now is in wet weather.

### A Veteran Architect.

By the death of Mr. Thomas Chambers Hine, F.S.A., which took place at Nottingham on February 6th, the profession of architecture has lost a distinguished and experienced member. Mr. Hine was born in 1813, and in 1834 he became partner to Mr. Patterson, with whom he had been articled. In his early days Mr. Hine became a diligent student of the Gothic style of architecture. His first work after starting practice for himself was the Bentinck Memorial erected at Mansfield. Later he devoted himself chiefly to ecclesiastical architecture. He was responsible as architect for the building and restoring of a large number of churches in Notts. and the surrounding counties. Mr. Hine retired from active work in 1890, but since then he had been busily engaged, almost up to the time of his death, in artistic and antiquarian studies.

### Artist or Craftsman.

MR. VERESTCHAGIN, the famous Russian artist, in the course of a rather curious article in the "Westminster Gazette" discusses the essential characteristics of the artist, and shows wherein they differ from those of the mere craftsman. "I insist," he says, "on the fact that it is unjust to call a craft only the so-called 'day's work,' and unjust to find art only in painters, sculptors, writers, musicians, actors, down to photographic improvers inclusive; it is unjust to think that only the representatives of these professions are artists; well it is that they themselves should be assured of this, when often amongst them are some less real artists than are to be found, for instance, amongst peasant handicraftsmen, creating cunning little things out of their own brains and with their own rough fingers. All persons putting into their work not only

talent but creative power are certainly artists in their work, and this in all spheres of intelligent labour—everywhere natures endowed with the artistic fibre direct the work, infuse into it movement and life, while businesslike natures manage routine work, crafts."

### Birmingham Art School.

THE Municipal School of Art at Birmingham is one of the largest and most successful Art Schools in the kingdom. The Central School and its branches have now some 4000 individual students, drawn from all classes of the citizens, and interested in nearly every department of local industry. The fourteenth exhibition of students' work was opened last week, and some 1100 works were exhibited. The exhibits include some fine drawings in building construction and architectural design. The Chamberlain Medal is awarded to William Haywood for a design for a country house; the same exhibitor takes a prize of £5 for a design for a town house. Harry Phibbs is the winner of the prize for architectural measured drawings.

### Sir W. B. Richmond on Ruskin.

THE prizes were distributed last Friday by Sir W. B. Richmond, who in the course of his address referred to the loss sustained by art in the death of some of its great leaders, primarily Lord Leighton, who first began to remove the somewhat insular prejudice, which was natural to the country, that a work of art must necessarily be an oil picture. There remained with them, however, a great teacher in John Ruskin. It was impossible to estimate what he had done for the arts of the country. Notwithstanding the kind of reversion of feeling which had taken place in the new direction they called Impressionism, the great man still survived, and still interested them. The first thing Ruskin did was to call the attention of the English people to the beauties of nature; he also enlisted their interest in earlier forms of Italian art, and he led them in a pure direction. Naturally a reaction came, and they found themselves, after the extraordinary era of Purism, suddenly launched into the French atmosphere, which now went under the name of Impressionism. But he (the speaker) saw considerable signs of the malady abating, because, until it was abated, the arts of design would not have a fair chance. He regarded the crafts as essential to the welfare of the art of England.

### The Greyfriars' Church Dispute.

THE Greyfriars' Church question has entered a new phase. At the Town Council Mr. Gordon, Town Clerk, read a letter which he had received from Messrs. Menzies, Black, and Menzies, Edinburgh, to the effect that since they last communicated with him on the subject of Greyfriars' Church, negotiations had been going on between their clients and the other parties interested, which seemed to hold out a prospect of an early settlement of the difficulties. In consequence of this their clients had not been pressing the matter in the meantime. By the decision of the Town Council on the 16th ult. these negotiations had been brought to a fruitless end. The delay had caused, and was causing, great inconvenience in connection with the parish work. Their clients were agreeable to have had the church restored on its present site, but as this was not to be done they had instructed the firm to press energetically for fulfilment of the second section of the agreement, schedule 2, the Aberdeen University Buildings Extension Act, 1893, by the erection of a new church on the site stated in the agreement. The firm would be obliged if the town clerk would submit the letter to the first meeting of the Council, when they hoped to learn that arrangements were made for progress in getting the agreement carried out, as failing satisfactory arrangements being immediately made their instructions were to raise an action for implement of the agreement. It was agreed that the matter should be considered by the Council in committee.

## Keystones.

**A Ruskin Hall** is to be formed at Liverpool.

**A Public Library** is to be erected at Weston-super-Mare.

**St. James-the-Less Church, Ancoats**, is to be repaired and decorated at a cost of £600.

**A proposed new theatre** for Stoke-on-Trent, at a cost of £15,000, has just been granted a license.

**The restoration of the Bradford Parish Church** is expected to be complete within about two months.

**A stained glass window** in memory of Mr. Gladstone is to be added to the Cleckheaton Liberal Club.

**Birtley**.—The foundation stone has been laid at Birtley of a new Primitive Methodist chapel, which is to cost £2800.

**A Gladstone Statue** is proposed for erection in Glasgow, and the Lord Provost will hold a meeting of citizens to-day.

**Malin Bridge, Sheffield**.—A site for a new Methodist New Connexion chapel has been secured at Malin Bridge, near Sheffield.

**A New Parish Hall** in connection with St. Cuthbert's Church has been opened in Framwellgate, Durham. The mission room has cost £700.

**A Memorial Window** has been added to Park Church, Glasgow. It is a light and traceried window, and has been stained glass erected by Messrs. Stephen Adam and Son.

**Skeen Square, Aberdeen**, is to be widened on its west side, under an arrangement with Mr. George Watt, architect, who owns property there.

**A new organ** has been presented to Drum-banagher Church, Down. The instrument was built by the Messrs. Telford and Telford, St. Stephen's Green, Dublin.

**An Art School** and Technical Institute over the Butter Market, Chichester, is proposed for erection, and a Local Government inquiry was held last Tuesday week.

**New Schools at St. Werburgh's, Derby**, are to be shortly erected, and towards their cost Mr. Alton has promise to give £1000. The Bishop of Derby is giving a site in Uttoxeter New Road.

**The rebuilt Colston Hall, Bristol**, is to be provided with an organ, by Sir William Henry Wills, M.P., to be built by Henry Willis, at a cost of £5000 to take the place of the fine instrument entirely lost in the fire.

**A new west window** has been added to St. Peter's, Newlyn. The window contains memorial lancets to Bishop Philpotts, of Exeter, and Archbishop Benson, the first Bishop of Truro.

**Plans of a Model Lodging-house** at Sheffield are to be submitted to the Local Government Board for approval. They will be two or three-story buildings, rather than the barrack-like kind erected in London and many other large cities.

**The Belfast Maternity Hospital** is to be rebuilt, the present accommodation being quite inadequate. The new building is expected to cost about £7000, and a committee has been appointed to raise the necessary funds.

**A Good Bargain**.—Mr. Benton, the contractor who purchased Christ Church, Birmingham, for a £5 note, because it had to be pulled down immediately, expects to clear £2000 by the transaction. The bell alone has changed hands for £80.

**A handsome memorial** of the late Mr. Henry F. Begg, Lochnagar, has been erected in Allenvale Cemetery, Aberdeen. It is of white Kemnay granite, and is in the form of a very elaborate tablet, 11ft. wide by 10ft. high, with three moulded bases, a massive inscription block, surmounted by a finely designed moulded pediment cap. The design of the memorial is by Mr. A. Marshall Mackenzie, A.R.S.A., and the work has been carried out by Baillie Taggart, Great Western Road,

**The New School of Art, Wordsley**, was opened last Monday week. Mr. T. Robinson is the architect, and Mr. G. Meanley the builder. The cost has been about £1300, but it should be stated that a number of gifts of terra-cotta and other work have been made.

**A Pastel Exhibition**, the first that has been held in London for eleven years, is now open at the Royal Institute. This art has been more popular in France than in this country, and some of the best things in the present Exhibition have been sent over from Paris.

**The aerial graphoscope** formed the subject of an interesting lecture delivered by Mr. Eric St. Bruce, M.A., under the auspices of the Leeds Institute of Art, Science, and Literature on Wednesday. The instrument gives photographic projections without the aid of a screen.

**Pendleton's Dominican Church** of St. Sebastian is now in course of erection in the Gerald Road, Pendleton. A priory, to accommodate a larger number of fathers, will soon be built according to the designs of Messrs. Sinnott, Sinnott, and Powell, the architects of the new church.

**A Public Hall for Larbert, Scotland**, is to be given by Major Dobbie, of the firm of Messrs. Dobbie and Forbes, ironfounders, Larbert. The hall the Major proposes to erect is to cost from £7000 to £8000, and will be capable of holding from 1000 to 1200 people. A free site is also in the gift.

**A New Educational Association** has been formed, having for its object the banding together of managers and governors of schools with a view to effecting various improvements in the prevailing systems of general and technical education. Mr. C. E. Luard, of Seven-oaks, is the hon. secretary.

**The Aberdeen Harbour Board** have under consideration a scheme by Mr. R. Gordon Nicol, harbour engineer, for the proposed extension of the Fish Market along Palmerston Quay. The cost of the alterations is estimated at £3760, and the time required for carrying them out at about five months.

**The Nave of Truro Cathedral** is to be completed as a memorial to the late Archbishop Benson. At a recent meeting of the Cathedral Committee it was decided to invite tenders from six firms recommended by the architect, Mr. Pearson, and from such other firms—not exceeding six—as the Executive Committee might select.

**Bermondsey Abbey**.—The Rev. W. F. Brown points out that the Tower Bridge southern approach, at present in course of formation, will run right across the site of Bermondsey Abbey and the Abbey Church, and he expresses the hope that any relics or remains that may be discovered will be carefully and reverentially treated.

**The Ironmongers' Almshouses**, in the Kingsland Road, are threatened with destruction. The vestry of Shoreditch wants the site on which they stand for the erection of an electric light station, and is appealing to the County Council to ask for powers of compulsory purchase in their next General Powers Bill. It is to be hoped the Council will reject the appeal.

**A Church for Sale**.—The following curious advertisement appeared recently in the "Liverpool Post":—"On sale, St. John's Church, Liverpool, comprising four bells, clock in steeple, pews, timber, slates, flags, stone, bricks, doors, windows, copper plates, lead, heating apparatus, safe, forms, tables, gas fixtures, tiles, &c.—Apply, H. Hindley, Leigh, Lancashire.

**New Buildings at Greenock**.—The following plans have been passed for erection in Greenock:—Messrs. Scott and Co., to erect new sawmill premises at their east shipbuilding yard. The Board of Police to erect in Hunter Place a power-house and generating station for electricity. The plans show a building of three stories in height and plain in design. The building, which will be of brick, will consist of boiler-house, office, generating departments, &c. The estimated cost is £5000,

**Mr. Goscomb John, A.R.A.**, one of the four artists recommended to the committee by the President of the Royal Academy, has been commissioned to execute a statue of the late Duke of Devonshire, which is to be erected at a cost of 1000 guineas, probably at the seaward end of Devonshire Place, Eastbourne. The statue, which is to be in bronze, will have a height of 9ft., and will have a granite base.

**A bronze statue** to ex-Provost Peter Reid has been erected at Forfar, and was unveiled last Saturday week. The figure is life and a quarter size, and is seated in a chair, placed on the top of a polished granite pedestal. Mr. George Webster, of Edinburgh, is the sculptor, and the bronze is by Messrs. J. W. Singer and Son, of Frome. The statue was set up by Mr. James Maclean, builder.

**New Hospital for Scarborough**.—The Local Government Board have held an inquiry at Scarborough with reference to the application of the Corporation for power to borrow £15,000 for the erection of a new infectious diseases hospital. It will contain thirty-two beds, and provision is made for the reception of cases of scarlet fever, enteric fever, diphtheria, measles, &c. Ample provision is made for enlargement if necessary.

**The Damming of the Nile**.—On Sunday, the Duke of Connaught laid the foundation-stone of the first of the two huge dams which are being constructed across the Nile by the Egyptian Government through the agency of Messrs. John Aird and Co. The work of building the dam is expected to occupy ten months. The dam will be a mile and a quarter in length, 80ft. wide at the base, and 80ft. high. It will raise the level of the Nile for a distance of 140 miles.

**The Birmingham City Council** last Tuesday week approved of the plans for the erection of the proposed new cattle market in Montague Street, at an estimated cost of £9957 and £750 for Architect's commission, and also the plans for the new asylum at Hollymoor, at a cost of from £120,000 to £150,000. A number of memorials praying for the establishment of a natural history museum for Birmingham were referred to the General Purposes Committee.

**Acetylene Gas for Hawes**.—At a representative meeting of tradesmen and others interested in securing a better light for the town of Hawes, Mr. G. S. Beckett gave an exhibition of acetylene gas, and made a statement of its advantages as an illuminant. It was decided to form a small company for the purpose of lighting the town with this gas. A committee was appointed to arrange for the formation of a company to obtain the permission of the Rural District Council to lay mains.

**Glasgow Fine Arts Institute**.—The thirty-eighth annual exhibition of pictures and sculpture held by the Royal Glasgow Institute of the Fine Arts was opened last week. There are many meritorious works, though few of outstanding interest, and the hanging arrangements are not of the most satisfactory kind. One of the most striking among the architectural subjects, is a drawing by T. M. Cappon, F.R.I.B.A., of the Church and Presbytery for St. Patrick's, Dundee.

**An Irish Light Railway**.—A scheme is on foot for constructing a light railway from Newry to Keady. The project has excited throughout the district very considerable popular interest. The executive committee have taken steps with a view to securing returns as to the traffic which would be obtained from the different districts through which the line will pass. They have also conferred with the directors of the Clogher Valley Railway, who are heartily in favour of the scheme.

**Liverpool Post Office**.—By permission of Mr. W. H. Preece, C.B., F.R.S., members of the Liverpool Engineering Society last Wednesday inspected the new Liverpool post office fittings and machinery. Mr. Preece, himself was present. The new building covers nearly two acres of ground, while there is provision for future extension towards Whitechapel. The cost can at present only be roughly estimated, but it will not including, site, be less than £350,000.

## Professional Practice.

**Aberdeen.**—The plans of the following new buildings have been sanctioned by the Plans Committee of the Aberdeen Town Council:— Dwelling-house on the north side of Queen's Road, for Mr. Archibald Coutts, engineer, per Mr. George Coutts, architect; two dwelling-houses on the west side of Wallfield Crescent, for Mr. Leslie Smith, builder, per Mr. R. G. Wilson, architect; alterations and additions in connection with No. 16, King Street, for Mr. John E. Esslemont, merchant, per Mr. R. G. Wilson, architect; two dwelling-houses on the south side of Brown Street, Woodside, for Mr. Charles Lamont, Brown Street; stone-polishing mill, sheds, and offices on the north side of Regent Walk, for Mr. Robert Lawrence, stone-cutter, per Mr. William Smith, architect; shed on the west side of Hardgate, for Mr. William Anderson, gardener.

**Dundee.**—The drawings lodged in this session's competition of the Dundee Institute of Architecture are as follows:—In Class I. five sketch books were sent in, and the first place is adjudged to Mr. David Harvey, 2, Southfield, St. Andrews, whose "sketches" show more of the painstaking endeavour to sketch something which will be of future use; and that submitted by Mr. James Marshall, Langlands Street, Dundee, is highly commended. In Class II. four sets of measured drawings were submitted, the first place being awarded to Mr. David Nivison, Guardbridge, Fife, for his drawings of Leuchars Church. The others are Murroes Church, by Mr. James Nicoll; Dairsie Church, by Mr. F. C. Webster; and St. Serf Church, Dysart, by Mr. John Keddie. In Class III. only one work was sent in, viz., a memorial tablet by Mr. G. T. Mitchell, to whom an honorarium was awarded. In Class V. the works are one study of an external doorway, three studies of wall drinking fountain, and four studies of iron gates and railings. The first place is awarded to Mr. James Marshall for his exterior doorway; while Mr. John A. Myles is highly commended for his two works under the mottoes *Scotia* and *Caledonia*. The judges were Messrs. T. M. Cappon, F.R.I.B.A.; James Hutton, George Jamieson, R. Blackadder, and J. J. Henderson, and they considered that the works sent in compare favourably with those submitted in previous years. At the same time there is still room for more competitors and better work.

**Harrogate.**—The result of the competition for the erection of a new Pump Room is as follows: First premium, £50, Mr. F. Anderson, 18, Adam Street, Adelphi, London, W.C.; second premium, £30, Mr. Arthur A. Gibson, architect, Harrogate; third premium, £20, Messrs. Eade and Johns, architects, Ipswich. By the conditions of the competition, the cost of the building was not to exceed £8000. As an alternative, designs were invited for the enlargement of the present Royal Pump Room, and in this competition also Mr. Anderson takes the first premium, £30. The second premium, £20, is awarded to Mr. E. Jenkin Williams, architect, Cardiff; and the third, £10, to Messrs. Hunt and Shield, 3, New Inn, Strand, London, W.C.

**Lowestoft.**—The new Baptist chapel, Lowestoft, was opened for worship on Thursday. The new church has seating room for upwards of 700 persons. The pulpit is of Caen stone, with green marble shafts. The general scheme of the church is a central nave with lofts, open-timbered ceiling, and a range of three-light windows in a clerestory on each side over the lean-to aisle roofs. The whole internal arrangements are well carried out. Externally the front of the church consists of a bold central gable, containing three windows on the ground floor, and a large five-light traceried window above, all flanked by octagonal pinnacles on each side, and beyond rises a handsome square tower containing the main entrance doorways, above which are triple windows. The whole of the work has

been carried out by Mr. John Ashby, builder and contractor, South Lowestoft, from the designs and under the superintendence of Mr. George Baines, F.R.I.B.A., 5, Clement's Inn, London.

**Sheffield.**—The Gleadless Road Board Schools, Heeley, have been extended by the addition of a new Girls' Department. The architect, Mr. C. J. Innocent, has provided what is a new departure—large separate rooms for cookery and manual instruction. These rooms are in the basement, and are lofty and well lighted. They are provided with separate entrances. The new building accommodates 390 girls, at a cost of about £11 14s. 2d. per head. The contractor was Mr. John Lister, of Aston. Messrs. J. C. and J. S. Ellis have put in the heating apparatus.

**Southwark.**—The new Passmore Edwards public library, which has just been erected in the Borough Road by the Library Commissioners of the Parish of St. George the Martyr, Southwark, was formally opened on Wednesday. The new building, which is situated close to the Borough Polytechnic, has been constructed in red brick and terra-cotta from the designs of Mr. A. B. Jackson, and contains lending and reference libraries, news, magazine, and boys' rooms, and a residence for the librarian.

**Tottenham.**—An action (*Tyler v. Renad*) in the Queen's Bench Division, on last Monday week, was brought by Mr. Robert Emeric Tyler, architect, carrying on business in the City, against Mr. Charles Renad and Mr. Frederick Renad, the well-known acrobats, to recover £300 in respect of fees for preparing the plans and drawings for a theatre at Tottenham. Defendants denied liability.—Mr. Maloney appeared for the plaintiff, while Mr. Parkyn represented the defendants.—Plaintiff stated that on January 25th, 1897, he was introduced to Mr. Frederick Renad, who informed him that he and his brother proposed to build a theatre at Tottenham, and asked whether he would act as architect. He agreed to do so, and, in accordance with instructions which he received from Mr. F. Renad, he prepared the necessary plans and drawings, which had to be submitted to the District Council at Tottenham and the Middlesex County Council. The plans were passed by these authorities, quantities were taken out, and builders were invited to tender for the erection of the theatre; but eventually the scheme fell through owing to the fact that the necessary money was not forthcoming. He now contended that he was entitled to recover from the defendants his fees at the rate of three per cent. on the lowest tender submitted.—The defendants denied that they instructed the plaintiff to prepare the plans and drawings in question, and contended that, if he prepared them at all, he did so at the request of the Albert Theatre Syndicate (Limited), which was formed for the purpose of purchasing the freehold of the Tottenham Public Hall and adjoining land, and erecting a theatre on the site. They further said that the plaintiff was a member of the syndicate, and that his remuneration was dependent on the success of the scheme.—Plaintiff, in reply, said there was no ground for the suggestion that he prepared the plans and drawings on behalf of the syndicate. As a matter of fact he did not hear anything about the syndicate until some time had elapsed.—The jury found a verdict for the plaintiff, and assessed the damages at £258 13s., and judgment was given accordingly.

**The New Town Hall for Cardiff.**—The Mayor of Cardiff has undertaken to invite members of the Royal House to visit Cardiff in connection with the forthcoming National Eisteddfod, to take place in July next. It has also been resolved that, subject to the architects being able to make arrangements, a request to lay the foundation stone of the new Town Hall and Law Courts be embodied in the invitation to Royalty to visit Cardiff in July.

## Under Discussion.

### HINTS ON SHORING.

At a recent meeting of the Glasgow Architectural Association, Mr. W. H. Baxter read a paper entitled, "Some Hints on Shoring." The paper dealt with the difficulties commonly met with in the carrying out of such work, and especially in regard to needle and to raking shores and their foundations. In connection with the former, whilst the use of the screw jack was advocated, the danger of leaving them to carry all the weight was pointed out and blocking up under the needle was suggested. The use of cast-iron needles was condemned especially in conjunction with screw jacks, owing to the unreliability of the materials. Steel rolled beams were better, owing to their elasticity. The calculation of the weight to be borne by these was touched upon, and it was pointed out that in the era of fireproof construction which lay before us, the added weight of these would require to be allowed for. Common joisted floors, which weighed 12lb. and 14lb. per square foot, were now replaced by patent systems weighing up to 60lb. and 70lb. per square foot. Improved methods of bracing openings and supporting internal and area walls were demonstrated. Raking shoring was taken up, and some of the English methods were shown by drawings, and the peculiarities of shoring for brickwork were exhibited. The mechanics of raking and flying shores, and the calculations necessary before their erection, closed the practical side of the paper. In his conclusion, the lecturer blamed the present day method of describing such work in specification as the cause of so much inferior and insecure work being in evidence in Glasgow, and gave it as his opinion that if architects were to take a closer personal interest in the work and control it to a greater extent than at present, the system of doing such work would be improved. The paper evoked a good deal of discussion, and the lecturer was awarded a vote of thanks at the close.

### BRITISH ARCHÆOLOGICAL SOCIETY.

At the meeting of this Association, held at the rooms in Sackville Street, Piccadilly, on the 1st inst., Dr. Winstone in the chair, Mr. Joseph K. Aston exhibited, through Mr. Bloshill (honorary treasurer), a number of objects found in excavating for the foundations of new additions to the Bounty Office, Dean Street, Westminster. The new building fronts on Great Smith Street, and the site is probably on the margin of Thorney Island, on which Westminster Abbey was founded. The objects exhibited included a perfect specimen of a Bellarmine bottle or "Greybeard," and fragments of English and Dutch pottery with eighteenth century china. Several copper coins of George II. indicate the age of the stratum through which the excavations were carried. Three Nuremberg tokens of the sixteenth century were also found. Amongst numbers of bones of animals that were met with were several skulls of the wild boar and bones of the ox, possibly of the wild ox. Mr. Could exhibited the rim of a vase found at Chigwell, Essex, interesting as showing the survival of ornament of the Bronze age. Mr. Earl Way brought for exhibition a collection of Roman pottery from Southwark, consisting of Samian and Upchurch ware of the best period, also some small glass bottles and a bone needle, with coins of M. Agrippa, Claudius, and Nero, and a Roman lady's hairpin of bone, nicely carved and terminating with a crown. He also submitted a Greek coin of Alexander the Great in fine condition, and a rosary of polished stone beads from Burmah. The Roman remains were found on the site of a pile dwelling near Southwark Street, at the depth of 14ft. from the surface, the hairpin at the depth of 9ft. The paper of the evening was by Mr. C. H. Compton, V.P., and formed the second part of a paper on the Welsh Marshes, read by him on Dec. 7 last. Before the meeting separated,

a vote of congratulation to the Mayor and Corporation of Southampton upon the preservation of the Bar Gate was unanimously passed, and directed to be transmitted to the Town Clerk by the hon. secretary.

#### SOCIETY OF ENGINEERS.

The first ordinary meeting of the Society of Engineers for the present year was held on Monday, February 6th, at the Royal United Service Institution, Whitehall. Mr. William Worby Beaumont, the President for 1898, occupied the chair, and presented the premiums awarded for papers read during that year, viz.: The President's Gold Medal to Mr. Fox, the Bessemer Premium to Mr. Sherard O. Cowper-Coles, the Rawlinson Premium to Dr. J. C. Thresh, and a Society's Premium to Mr. George Thudichum. Mr. Beaumont then introduced the President for the present year, Mr. John Corry Fell, to the meeting, and retired from the chair, receiving a hearty and unanimous vote of thanks for his services during the past year. Mr. Fell then delivered his inaugural address, in the course of which he discussed the question of the protection of inventions by patent in engineering practice, and pointed out the curious fact that civil engineers availed themselves less than any other members of the Profession of the privileges accorded to inventors by patent, designs, or copyright protection. This, he said, was perhaps due to the circumstance that civil constructive engineers took a higher professional standpoint, and considered that the credit attached to their designs, however useful or beautiful, was a sufficient reward without seeking to retain a monopoly in them by patents, even for a time. This view, he said, did not extend to the mechanical branches of the Profession, where every little detail improvement in machinery was protected, and a commercial end thus served. He did not, however, see why the same principle should not be observed by the civil engineer in regard to bridges, roofs, girders, and the like constructive details. With regard to successful invention, the President observed that the conditions should be the result of analysis or synthesis, not mere chance dashes into an unknown field. The method of analysis may be defined to be first an appreciation of a want to be met, with which the inventor is familiar, and then by a laborious selection from what is known, the development, by successive efforts, of a combination of suitable means to meet the want. The President then proceeded to give a short summary of the advances made of late years in various departments of engineering, in which he first referred to the increase in horsepower in engines which was obtained from a minimum of dead weight of material, and he explained the way in which it had been effected. In steam boilers, too, great advances had been made by the development of the water-tube system. He then referred to the progress made in electric lighting and in the application of electricity to the driving of machinery, especially in its use on railways. In this latter connection he described the recent development of the electric railway system in the metropolis. Improvements in gas lighting and the progress of acetylene as an illuminant were then discussed, and, finally, the latest phases of naval construction, including submarine torpedo boats, were considered.

#### SHOP FRONTS.

At a meeting of the Glasgow Architectural Association on February 7th, Mr. George S. Hill, A.R.I.B.A. in the chair, a paper was read by Mr. John Lochhead, A.R.I.B.A., entitled "Shop Fronts." The essayist shortly described the shops of the seventeenth and eighteenth century, and quoted several enactments passed about those times regulating the projection of stall board, resulting in the flat bow window which was still a common feature of English shops. With the introduction of plate glass the necessity for numerous astragals had been done away with, and, with the possibilities of having large windows in single sheets, the desires of tenants had increased, and shops to please them

must have the whole front practically one sheet of glass. It was almost always the desire of the tenant of a corner site to carry his windows unbroken round the corner, and this caused a great loss of appearance to the whole building, as all idea of strength at the corner was gone when the corner butt was dispensed with. The idea of recessing the shop front and carrying along a colonnade was good, as it afforded not only protection to the windows, but also to the public while examining the goods on view. The interesting series of shops called the "Row" at Chester was referred to, where the first floor was also devoted to shops, access being obtained by means of a gallery running along at that level. The speaker advocated greater individuality being given to shops occupied by tenants carrying on different trades, and showed by means of photos and sketches the different treatment which could be accorded with pleasing effect to provision shops, public-houses, &c. In this connection also a large number of drawings were shown illustrating the treatment which the upper portion of a show window could have, either by dividing the pane by vertical or radiating astragals, or by the uses of etched lines, &c., round the panes. As only a height of 7ft. to 8ft. was required for the show case in the window, the treatment thus given did not detract from the showing of goods, while at the same time giving a most pleasing effect to the whole window. At the close of his paper the meeting accorded a cordial vote of thanks to Mr. Lochhead.

#### ELECTRIC TRACTION IN TOWNS.

At a meeting of the Birmingham Association of Mechanical Engineers, last Saturday week, Mr. J. Cox presiding, Mr. G. Conaty, of the Birmingham and Midland Tramways Company, read a paper on "Electric Traction, its Application in large Towns." After a brief reference to the historical side of the subject, and an expression of opinion in favour of the municipalisation of tramways in large self-contained towns, he proceeded to compare the relative value and utility of the systems now before the public from the standpoint of cost and of mechanical efficiency. The open conduit system, he said, seemed to meet with most approval from local authorities, but the only advantage claimed was that poles and overhead wires were not required. The cost of the system was, however, exceedingly high, and unless the traffic was enormous, a tramway based on that system could not possibly pay. In England the cost would amount to from £10,800 to £12,000 per mile of single track. The prolonged obstruction of the streets during construction was another serious disadvantage of the system, while there was also a danger in having a slot in the centre of the track. The closed conduit system had not, up to the present, received many supporters, it having barely passed the experimental stage. The cost was said to be much less than the open conduit system, but to mechanical engineers the difficulties attendant upon keeping the delicate switching parts in satisfactory order must be apparent. The accumulator system he dismissed with a reference to Birmingham's experience, and the statement that many improvements must be made before it could receive attention. The special advantages of the overhead system were cheapness, a minimum amount of inconvenience and delay during construction and repairs, and little interference with the surface of the streets. The principal objection to the system was, he said, its appearance. Turning to the practical details of overhead traction, he dealt first with the method of laying the track, advocating as the more permanent method the laying of the rails on longitudinal sleepers of pitch pine. It was, he continued, the method of suspending the trolley-wires which was responsible for most of the prejudice existing against the overhead system, but objection could hardly be raised to the appearance of the ornamental bracket centre poles used for traction and lighting purposes, which had been generally adopted

in English towns where the system was in use. The objection could only be raised in the case of towns with narrow streets, or where there was insufficient space between the two sets of rails to allow for centre poles. He had come to the conclusion that the Dickinson side contact system was the most suitable to meet that difficulty, and that its general adoption would remove all objection to overhead wires. In that system it was not necessary that the trolley-wire should follow the curvature of the track, and therefore the sidearms of the poles could be kept comparatively short. The trolley-pole formed a continuous bridge between the wire and the car. To accomplish that the apparatus had a vertical and horizontal radial movement, and would accommodate itself to the varying distances of the wire from the track to any position within its reach. Concerning the location of the power-station he expressed opinions unfavourable to the utilisation of the heat from refuse destructors for the production of "power." The construction of the other items of the plant, such as engines, generators, rolling stock, motors, brakes, and life protectors, were also reviewed. The working cost, under everyday conditions of electrically equipped tramways in Leeds was about 8.62d. per car mile.

#### ELECTRICITY IN THE POST OFFICE.

Mr. W. H. Preece, C.B., engineer-in-chief of the Post Office, and president of the Institute of Civil Engineers, on Wednesday evening, at the Royal Institution, Liverpool, read before the Liverpool Engineering Society a paper on "Electricity in the Post Office." Mr. J. A. Brodie presided. Mr. Preece said that the length of telegraph wires in this country had increased, while under Post Office administration, from 60,000 to 300,000 miles, telegraph business had increased four times as fast, and the fact that four times as much work was now done by the same length of wire was due to improvements made by officers of the postal service. He said it was possible now to transmit at 600 words a minute. There were 158,997 telephones at work in this country. As to trunks, the Post Office in 1897 took over 29,000 miles of wire. The length had since been increased to 56,000 miles, and the receipts had doubled. Mr. Preece went on to refer to cabling by telephone, as to the development of which over very long distances he took a sanguine view. He also dealt with the economies effected in the use of electricity for telegraphic purposes. The Post Office now produced its own electricity at 1d. per Board of Trade unit, and were replacing the old primary cell batteries, which cost 6s. per Board of Trade unit, by accumulators. The use of copper in electricity as compared with iron, was an improvement which he claimed had been introduced by the Post Office of this country. It was the use of copper which allowed of long-distance telephoning. Referring, in conclusion, to wireless telegraphy, he pointed out that it was already in use between forts at Laverock, on the Glamorgan coast, and Flat Holme, an island in the Bristol Channel. It had never been known to fail, and was independent of daylight or darkness, dry weather or wet, fog or clear air. He considered that wireless telegraphy had a great future.

**Birmingham Church Building.**—The trustees under the Birmingham Churches Act have, with the sanction of the Lord Bishop of Worcester, decided to make, out of the funds arising from the sale of Christ Church, the following grants for church building in the rural deaneries of Birmingham, Aston, and Northfield:—St. Luke's, £4000; Aston St. James, £500; Stechford £500; St. Barnabas Balsall Heath, £1000; for a new church at King's Heath, £1000; and for a new church at The Cotteridge, £2500. A sum has been reserved for the site of a second new church, which it is hoped will be built shortly, in the parish of Sparkbrook.

## CONTRACTS OPEN.

### CONGLETON UNION.

TO BUILDERS AND CONTRACTORS.

The Guardians are desirous of receiving TENDERS for the ERECTION of a NEW INFIRMARY at the Workhouse, Arclid, near Sandbach.

Plans and specifications can be seen at the Office of the Master of the Workhouse at Arclid.

Bills of quantities can be obtained from the Architect, Mr. ALFRED PRICE, Elworth, Sandbach, on depositing One Guinea, which amount will be returned on receipt of a bona-fide Tender.

Sealed Tenders must reach the undersigned not later than WEDNESDAY, MARCH 1st next, endorsed "Tender for New Infirmary."

The Guardians do not bind themselves to accept the lowest or any Tender.

Security will be required for the due performance of the contract.

By order,

HARRY FERRAND,

Clerk to the Guardians.

Union Offices,  
Sandbach,

February 8th, 1899.

### TO PAINTERS and DECORATORS.

The Trustees of the Grand Stand, Ascot, invite TENDERS for PAINTING and DECORATING the GRAND STAND and other buildings, at Ascot, Berks.

Quantities, and all information, may be obtained upon application to Mr. WILLIAM MENZIES, F.S.I., Englefield Green, Surrey.

The Trustees of the Grand Stand do not bind themselves to accept the lowest or any Tender.

January 31st, 1899.

### COUNTY COUNCIL of NOTTINGHAM-SHIRE. HIGHWAYS, BRIDGES, AND COUNTY BUILDINGS COMMITTEE.

The above Council are desirous of receiving TENDERS for the supply and delivery of GRANITE, SLAG, and LIMESTONE to Railway Stations and Wharves in Nottingham, on or before SEPTEMBER 29th, 1899.

The lowest or any Tender not necessarily accepted. Full information may be obtained from the undersigned on or after FEBRUARY 17th, 1899.

Tenders to be returned not later than first post on FEBRUARY 27th, 1899, to

E. PUENELL HOOLEY,  
Shire Hall, Nottingham.

### COUNTY BOROUGH of SOUTHAMPTON. TO BUILDERS AND CONTRACTORS. ARTISANS' DWELLINGS.

The Council are prepared to receive TENDERS for the ERECTION of a block of ARTISANS' DWELLINGS on the area recently cleared by them under the Housing of the Working Classes Act, 1890, with frontages to Sannel-street and Pepper-alley.

Bills of quantities and form of Tender may be obtained at the Municipal Offices, Southampton, between the hours of TEN a.m. and FOUR p.m. (Saturdays excepted), upon payment of a deposit of a £5 Bank of England Note with the Borough Accountant (which will be refunded upon receipt of a bona-fide Tender).

Copies of the drawings and specification may be seen at the Municipal Offices, 18, French-street, during the same hours.

Sealed tenders on the form supplied, accompanied by fully priced bills of quantities, to be sent to me not later than NOON on MONDAY, FEBRUARY 20th, next, endorsed "Tender for Artisans' Dwellings."

The contractor will be required to pay not less than the minimum standard rate of wages for the time being in each branch of the trade at the date of the contract.

The Council do not bind themselves to accept the lowest or any Tender, and the Contractor, whose Tender is accepted, shall enter into a formal agreement, under seal, with sufficient securities for the due fulfilment of the Contract.

By order,

GEORGE B. NALDER,

Town Clerk.

Municipal Offices,  
Southampton,

February 2nd, 1899.

### TO BUILDERS.

The Commissioners of Her Majesty's Works, &c., are prepared to receive TENDERS for the EXECUTION of ORDINARY WORKS and REPAIRS to BUILDINGS in the London District for Three Years, from April 1st, 1899.

The printed schedule, with form of Tender, may be obtained at Her Majesty's Office of Works, Storey's Gate, Westminster, between the hours of ELEVEN a.m. and FIVE p.m. upon payment of One Pound.

The sums so paid will be returned to those persons who send in Tenders in conformity with the conditions specified.

The Tenders are to be delivered at Her Majesty's Office of Works before TWELVE o'clock (noon) on SATURDAY, FEBRUARY 25th.

The Commissioners do not bind themselves to accept the lowest or any Tender.

REGINALD B. BRETT,

Secretary.

H.M. Office of Works,  
Storey's Gate,

## COMPETITIONS.

### COMPETITIVE DESIGNS.

The Leeds Corporation offer premiums of £150, £100, and £50, for first, second, and third best DESIGNS respectively, for MARKET HALL and MARKET SHOPS on a site of 4560 square yards in area, which forms part of the present Kirkgate Market.

Terms of the Competition and particulars of site can be obtained on application to the City Engineer, Municipal Buildings, Leeds.

Designs must be sent in to the Town Clerk, Town Hall, Leeds, not later than JUNE 1st.

### HEXHAM UNION.

NEW VAGRANT WARDS.

TO ARCHITECTS.

The Guardians of the above Union are prepared to offer a premium of £20 for the best and most economical PLANS for new VAGRANT WARDS to be erected at the Workhouse.

Further particulars on application to me the undersigned.

J. H. NICHOLSON,

Clerk to the Guardians.

Offices:—  
Midland Bank-chambers,  
Hexham,

January 26th, 1899.

## Water Supply, Drainage, Irrigation and Power

For MANSION, FARM, ESTATE or VILLAGE.

WATER SUPPLY,

Drainage of Quarries, Clay Pits & Low-Lying Lands or Ponds.

WIND POWER COSTS NOTHING, and

The "IDEAL"

GALVANISED

STEEL WINDMILL

Requires neither attention or outlay, as it is thoroughly Self-Regulating.

TURBINE AND WATER WHEEL PUMPS. TANKS, PIPES, AND FITTINGS.

JOHN S. MILLAR & SON, Water Engineers,  
ANNAN, N.B.

KENNAN & SONS,  
Fishamble St., Dublin.

RICHD. PATTERSON & CO.,  
High Street, Belfast.

234.—WASH-OUT.

SAMUEL HUNT ROWLEY, Swadlincote, nr. Burton-on-Trent.

PATENTEE AND MANUFACTURER OF THE

"WASH-OUT" CLOSET  
(PATENT).

Three Awards at the International Medical Sanitary Exhibition, South Kensington, 1881.  
Specialities in Closets, Traps, Urinals, Lavatories, Sinks, and other Sanitary Fittings.

Price Lists and Full Particulars on Application.  
Telegrams:—"ROWLEY, SWADLINCOTE."

BRICKS.

LIME.

CEMENT.

EASTWOOD & Co. Limited,

47, BELVEDERE ROAD, S.E.

Telegraphic Address:  
"MEASURES, LONDON."

## MEASURES BROTHERS, LTD. LONDON.

SIEMENS-MARTIN AND BESSEMER STEEL JOISTS.

MEASURES' JOISTS ARE THE BEST AND CHEAPEST IN THE MARKET.

Have now in their Town Stock 6500 tons of STEEL JOISTS, 3in. to 20in. deep; also 1000 Tons of Iron Joists, Channels, Tees, Angles, Plates, &c. Riveted Girders, Fireproof Floors, Stanchions, Columns, Chequered Plates, Rails, Bolts, &c.

SECTION SHEETS AND ESTIMATES ON APPLICATION.

Prompt Delivery from Stock. Steel Joists specially adapted for Pit Props and Colliery Work.

Telephone No. 4586.

From 3 in. to 20 in. deep.

# SUPPLEMENT FOR

SVRVEYORS · BVILDERS ·  
SANITARY ENGINEERS.

FEBRUARY 15TH, 1899.

## BOYLE'S PATENT "AIR-PUMP" VENTILATOR.

THE LATEST PATENT HAS DOUBLE THE EXTRACTING POWER OF EARLIER FORMS AND IS ONE-HALF THE COST.

ROBT. BOYLE & SON, LTD., 64, Holborn Viaduct, LONDON; & 110, Bothwell St., GLASGOW.

*See Large Advertisement, Back Page, Monthly.*

## THE PROBLEM SOLVED!

ORDINARY WOOD RENDERED FIRE-RESISTING THROUGHOUT  
WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.

## The British Non-Flammable Wood Co. Ltd.

who have recently introduced into Europe the process now being so largely used in America, have erected large works in this country, and are now taking Orders for the supply of their

### NON-FLAMMABLE WOOD.

The whole of the Carpentry and Joinery in the following notable buildings in New York, amongst others, consists of NON-FLAMMABLE WOOD:—

THE COMMERCIAL CABLE BUILDING,  
THE QUEEN'S INSURANCE BUILDING,  
... and ...  
THE R. G. DUNN BUILDING.

NON-FLAMMABLE WOOD has been tested by H.M. Admiralty, and large Orders have been given by H.M. Government.

Quotations on receipt of Requirements, Address, &c.

## THE BRITISH NON-FLAMMABLE WOOD COMPANY Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

## STRAINS IN BEAMS.

BY CHARLES W. TOMLINSON.

IT is proposed within the limits of a short article to show the method of obtaining the amount of stress produced by a given load in such a manner as to simplify somewhat the formulæ given in the text-books. In the first place, a few preliminary definitions are necessary.

**Load or Weight.**—The total amount of weight carried by a beam.

**Safe Load.**—The amount of weight the said beam is expected to actually carry when in position, sometimes called the working load.

**Breaking Weight.**—The amount of load that is just sufficient to produce fracture in a beam.

**Factor of Safety.**—The ratio or proportion the breaking load bears to the safe load. This is usually, but not always, taken at four, that is, the beam is not expected to be loaded with more than one-quarter of the weight which would actually break it.

**Distributed Load.**—The weight distributed along the whole length of a beam.

**Concentrated Load.**—The said load when concentrated at any point in the length of a beam. A concentrated load is usually taken as producing double the amount of stress produced by a distributed load of the same weight. Thus a concentrated load can easily be reduced to its equivalent as a distributed load and vice versa.

**Span.**—The clear span is the distance between the supports. The effective span is from the centre of gravity of the supported part at one end, to a similar point at the other

FIG 1

end. (See Fig. 1.) In questions set on this subject the effective span is usually implied and understood.

The first problem which requires any calculation is to ascertain how much of the weight is transmitted to each point of support. Should the load be an evenly distributed one, or concentrated in the centre, it is scarcely necessary to say that just one-half is borne by each abutment. When the weight is not in the centre, the portion transmitted to each abutment is in direct proportion to the distance

FIG 2

of the load from the other abutment, and is found by the following method. (Fig. 2.)

$$\text{Portion of load borne at A} = \frac{w \times y}{l}$$

$$\text{Do. } B = \frac{w \times x}{l}$$

The two answers added together give, of course, the total weight.

Should there be more than one weight, each must be worked out separately, and the two added together to obtain the total weight carried at each support.

Should there be a distributed load over a small part of the beam, as Fig. 3, this would be worked out as a concentrated load of five tons, exactly in the centre of the weighted portion,

FIG 3

FIG 4

as Fig. 4. These results are termed the reactions of the abutments.

The next thing is to find the amount of stress produced, or bending moment as it is

termed, at any point in the beam. This is really a problem in applied mechanics. An

FIG 5

example (Fig. 5) will best show the method.

The amount of stress is wanted at point X, distant 3' 6" from A.

(I.) Find reactions—

$$\text{At A} = 10 \times 3 \div 8 = 3.75 \text{ tons.}$$

$$\text{At B} = 10 \times 5 \div 8 = 6.25 \text{ tons.}$$

(II.) Stress at X =  $R_a$  (or reaction at A)  $\times$  distance to the point required; thus  $3.75 \times 3.5 = 13.125$  tons.

This answer may be proved by working from the other end (B) to the same point. It will be noticed that the whole problem hinges on the theory of the lever,  $R_b \times$  distance from B to X (length of leverage) and in this case, the  $W \times$  distance from W to X, the latter being a negative. Thus  $R_b \times 4.5 \text{ ft.} - W \times 1.5 \text{ ft.}$ , or  $6.25 \times 4.5 - 10 \times 1.5 = 28.125 - 15 = 13.125$  tons.

It will doubtless be observed that it is the reaction which produces the stress, work from which end you will.

This is the rule. When there are a number of weights, or forces, on the beam, multiply each force on one side of the point selected by its distance from that point, and add together all these moments, first those pushing up (reactions), second, those pushing down (weights). The former are positive and the latter negative, and the latter must be subtracted from the former. The remainder will be the amount of stress at the given point.

FIG 6

To conclude, a more elaborate example will be shown. (Fig. 6.)

In a beam loaded as in Fig. 6, the amount of stress is wanted at X, a point 7' 0" from A.

(I.) Find re-actions:

$$\text{At A: } \frac{7 \times 16}{20} + \frac{8 \times 18}{20} + \frac{5 \times 2}{20} = \frac{266}{20} = 13.3 \text{ tons.}$$

$$\text{At B: } \frac{4 \times 7}{20} + \frac{12 \times 18}{20} + \frac{18 \times 5}{20} = \frac{336}{20} = 16.7 \text{ tons.}$$

(II.) Find stress at X:

$$13.3 \times 7 - 7 \times 3 = 93.1 - 21 = 72.1 \text{ tons.}$$

This may be proved by working from B.

$$16.7 \times 13.0 - (18 \times 5 + 5 \times 11) = 217.1 - (90 + 55) = 217.1 - 145 = 72.1 \text{ tons.}$$

**Mr. Demish H. Barry, F.S.I.**, has been appointed by the Benchers as Surveyor to the Honourable Society of Lincoln's Inn.

**Dorchester Sewerage Scheme.**—The Town Council of Dorchester have been informed by the borough surveyor that he has completed the plans of the new sewerage scheme, and has forwarded them to Mr. Lomax, the Council's consulting engineer.

**Sheffield Improvements.**—The Improvement Committee of the Sheffield Corporation propose to make application to the Local Government Board for sanction to borrow £4800 for street widening improvements, the total cost of which will be about £8500.

**At Heaton Norris** an inquiry was held on Thursday by the Local Government Board, touching the Council's application to borrow £6407 for works of sewage and sewage disposal and other sums for private street works. The scheme is to include the sewerage of Burnage, and the provision of precipitation work, &c. The opposition was mainly against the erection of a destructor, which it appeared was not at present intended.

## THE FORMATION OF SOILS.

BY GUY CADOGAN ROTHERY.

MODERN geologists mostly accept the theory that the earth was at one time either wholly or partially molten, the outer surface being hardened by the cooling effects of radiation and of atmospheric pressure into a crust—the igneous rocks. These primitive rocks form one important group; though as we see them they have undergone metamorphism, they are very uniform in composition and are rich in the minerals, aluminium, silicon, carbon, calcium, magnesium, chlorine, phosphorus, potassium, and sodium. A sub-group of the igneous rocks is due to volcanic action, a manifestation of heat energy from the interior, or from below the immediate hard crust of the earth. These volcanic rocks have been either belched forth in a molten state, as red hot scoria, or come bubbling up in vast seething pools or lakes, and flooding the country cooled down in dense masses. The volcanic rocks have much in common with the plutonic igneous rocks, but are somewhat less uniform in composition, and are often found in well marked strata, due to successive layers of molten matter cooling down, and sometimes receiving a layer of transported soil, or volcanic ashes, before another eruption had sent forth a fresh layer of liquid lava.

The second great group of rocks is the sedimentary, due to deposition of matter by water. Some of the sedimentary rocks are remarkably uniform for great depths—this is especially so with regard to the chalk and limestone—others are deposited in well-marked strata. The sedimentary rocks are, of course, derived from matter eroded from the primitive igneous rocks, and deposited by water. Many of them, therefore, contain precisely the same elements, but owing to the mechanical selective agency of water, and the chemical action of the atmosphere as well as the rain water, sedimentary rocks differ widely both as regards chemical and physical characteristics. Some sedimentary rocks have undergone considerable transformation by the action of subterranean heat or volcanic eruption, the rocks being partly melted, and their chemical and physical peculiarities more or less considerably modified. Metamorphism, or rock transformation is, indeed, a universal and continuous process. It may be brought about by various agencies: internal heat, volcanic action, the atmosphere, the pressure due to the enormous weight of superincumbent masses of rock, the mere contact of two different strata, molecular attraction; electric and magnetic phenomena being no doubt connected with the last two phases.

**NATURAL HEAT.**—Whether the interior of the earth is in a molten condition, or is hollow filled with gases, and a molten film clings to the inner surface of the earth's crust, the fact that there is an intense internal heat cannot be doubted. We have evidence of this in mining operations, for we find the deeper we go the greater becomes the heat. Sir Archibald Geikie says, "according to present knowledge the average rate of increase of the temperature amounts to one degree Fahrenheit for every 50 or 60 ft. descent, and this rise is found whether the boring be made at the sea level or on elevated ground." But there is some difference in the increase in various strata. Professor Everett, in *Nature* for Oct., 1881, states that the greatest increase yet observed was in shale in a boring near Glasgow 450 ft. deep, the ratio being one degree in 30 ft.; the lowest rate was observed in a mine in Bohemia, the rock being quartz, the boring 1900 ft. deep, and the ratio only one degree in 135 ft. Mr. Josiah Thomas found one degree in 98 ft. in a mine at Dolcoath. Possibly, at very great depths, the ratio of increase may be higher. At all events, this internal heat is enough to melt rock, the igneous rocks break through strata in molten masses, and, in doing so, change the nature of the rock at the rupture, and also the strata above and below. These intrusive igneous rocks are very curious, and they are powerful agents of metamorphism. Granite is produced by heat and enormous pressure, but

without complete melting, so that granites must have originated at very great depths, with probably an immense number of strata above them. These granites must have been upheaved, and the covering strata worn away. Volcanic action is not so powerful a metamorphising agent, at least its immediate influence is not so widely felt, for volcanic lava flows only change the surface of the rocks over which they lie, and to comparatively slight depths. On the other hand, volcanic action, whether violent or slow and continuous, causes upheavals and subsidences in the earth's crust, thus exposing rock surfaces to the action of air and water, or depressing others below the sea level, and often breaking horizontal strata, leaving great fissures, and heaping them up at great angles.

Atmospheric metamorphism is mainly brought about by disintegration and the quickening of chemical, molecular, and electrical action. These changes are very great. Delesse says "the study of metamorphism of clayey rocks has shown that when crystallisation is developed, felspar, quartz, and micas may be formed. Now, gneiss is the resultant of the association of these three metals, and so its metamorphic origin is shown to be probable." For a gain of knowledge in one direction enables us to apply it in another. The elements and the more complex minerals are diffused more or less evenly throughout the most elementary rocks, but the action of heat, molecular attraction, etc., tends to draw them together; thus we have in mineral veins sure sign of high metamorphism. Metals are usually found in marshes, tertiary, secondary, and primary rocks in a non-crystalline form, but in amorphous layers. These metals undergo change, and we find in semi-crystallised veins, changes are brought about by heat, general metamorphism, and pressure. Under pressure the metaliferous veins are strangulated, and form ovals or appear in the form of ganglins. The strangulation may go still further, and the metal veins be separated into independent lenticular forms. A still more interesting and instructive change is the transformation of the nature of the metal. Iron, for instance, will appear in one vein quite transformed at different points, being for some length of a sparry or calcareous description (siderite), but will tail off to the right into a protoxide, and to the left of the siderite into an oxide. Some veins are anhydrous, others hydrated, and in this latter case the metals have a tendency to disperse again, transforming the character of adjacent strata and the matrix in which they are imbedded. Metaliferous veins when exposed to the atmosphere, or through water reaching them by way of flaws and fissures, may completely disappear, dispersing in the rocks in the form of oxides and hydrated metals, in which form they may be dissolved by water and give rise to mineral springs.

Mr. E. W. Fox held that veins were due to the filling up of crevices by the electro-magnetic action on minerals. He says: "As mineral veins exist in rocks abounding with organic remains, which are to be seen even in the cheeks and walls of the veins, no doubt can be reasonably entertained of their having been originally cracks, fissures, or openings in the strata in which mineral substances have been deposited." His theory, which certainly seems to be borne out by observations, was that these crevices were very deep, and contained more or less saline water, which, owing to differences of temperature, was kept continually circulating, thus inducing and intensifying chemico-electro-magnetic action in the rocks, attracting the metals which were deposited in the crevices. There is much to be said in favour of this subterranean electric force as an agent in this phase of metamorphism. Instances of curious separation and depositing of metals have been recorded which tend to show that electro-magnetic agencies are at work.

Coal, as we know, is metamorphosed vegetable matter. It has been held that anthracite is merely metamorphosed coal, the change being brought about by combined heat and pressure, which caused the volatile and tarry matter to disperse. Sir Charles Lyell has shown that in America the volatile matters in

the carboniferous beds disappear gradually the nearer the mountains are approached. Anthracite is metamorphosed into graphite, in which form we find all traces of vegetable texture to have disappeared, the carbon appearing in a crystalline form. During these changes the volatile matters may be merely displaced, collecting in caverns, fissures in porous strata in the form of "natural gases," or mineral oils, or they may be split up and dispersed in more elemental forms. We might prolong this section indefinitely by tracing the changes of certain strata into granites, the disintegration of granites into sands and clays and the transformation of sands and sandstones, and clays into slate. The important matter is to bear in mind that metamorphism is a universal and continuous agency for transforming rocks and soils, causing endless combinations which may prove of great moment to man and his surroundings.

(To be continued.)

## THE CEMENT FAMINE.

FOR the past few months there has been a striking increase in the activity of the cement industry. Some four or five years previous to last June this trade had been in a very depressed state, some of the firms engaged in it even working at a loss. Prior to June the cost of production at the makers' works varied from 21s. 6d. to 22s. per ton. At the close of 1898 cement was fetching on the average 30s. per ton, and in some instances as much as 32s. 6d. There has, however, been an increase of 10 per cent. in the cost of manufacture owing to the rise in the price of coal and coke. This welcome revival in the works on the Thames, the Medway, the Tyne, in the Midlands, and other centres of the industry is due to the great demand for cement consequent on the activity in the building trade, the construction of new docks, harbours, drainage works, underground railways, and engineering works generally.

The present demand for cement is unprecedented, and nearly all of it produced in England is consumed by our own requirements. The German manufacturers have taken the opportunity to step in and practically secure the great bulk of the foreign trade.

It has been stated that the Works Department of the London County Council, failing to obtain Portland cement from English makers, have sent to Belgian makers for their cement, to be paid for by London ratepayers. Two cargoes of 300 tons each were received; and when the first cargo arrived a test was taken by the Council's engineers, who found it to be only half the strength of English cement; that it could not be returned to the makers, as it would have been if such stuff had been sent by English makers, and that a larger quantity of it had therefore to be used to make up for the deficiency in strength; and that the building of two large blocks of dwellings at Boundary Street, Shoreditch, was delayed quite two months for this cement, at great expense to the ratepayers. In reference to these statements, the Clerk to the Council wrote to "The Daily Mail" stating that in consequence of the great difficulty experienced in obtaining cement from English manufacturers, owing presumably to the great demand for cement required for large contracts in Egypt and elsewhere, it was found necessary in September last, in order to prevent delay in the erection of artisans' dwellings in course of construction by the Council at Boundary Street, Shoreditch, to obtain a consignment of cement from Belgium. No delay had been caused in the erection of the dwellings by the non-supply of cement, and only one order for that material has been placed in Belgium.

Mr. L. Sommerfeld, of 2, Fowkes Buildings, Great Tower Street, who supplied the Belgian cement to the County Council, states that the cement was sold to the County Council with a guarantee that it would stand a tensile strain of not less than 400lb. per square inch after seven days' immersion in water. The Council's engineers reported that the first consignment

showed a breaking weight (or tensile strain) of only 273lb. Mr. Sommerfeld was not prepared to admit the accuracy of the test made by the Council's engineers, however, and a second test was made by them. This gave a breaking weight of 334lb. Still another test was made by them, which gave a breaking weight of 275lb. He still declined to accept these tests, and it was agreed that the cement should be referred to Messrs. Henry Faija and Co., of 41, Old Queen Street, Westminster, S.W., who reported that it bore a tensile strain of 482lb. per square inch, a strain considerably above the guarantee. To further satisfy himself he sent on his own account a sample of the cement to Messrs. David Kirkaldy and Son, of 99, Southwark Street, S.E., and their report also showed that the breaking weight of the cement was 414lb., or considerably over what was guaranteed.

## Masters and Men.

**The Aberdeen Joiners** who went out on strike on the 1st inst. returned to work on the 7th. The men demanded an immediate rise of a halfpenny per hour, and the masters have agreed to give a farthing increase in April, and another farthing five months afterwards.

**The Plasterers' Dispute.**—The ballot taken by the Plasterers' Union on the question whether foremen should be compelled to become members of the Union has resulted in a decision against the proposal by 1552 votes to 729. This removes the original cause of dispute, and the question now is whether the masters will insist upon the remaining points of their ultimatum. If they do, there will necessarily be an extensive lock-out. But as neither side seems to desire a fight just now, it seems likely that a compromise will be arrived at. At the works of the Veronese Company—one of the three firms against whom the strike was directed—work was resumed on Monday morning on the old lines.

**Bath Master Builders.**—The annual dinner of the Bath Master Builders' Association took place on the 7th, the chair being occupied by Mr. Howard, the president. Responding to the toast of the National Association, Mr. A. Krauss referred to the demands made by the Plasterers' Society, and said they were unbearable and cruel. The National Federation had given notice to the Plasterers' Society to submit to their rules. If they did not give a satisfactory answer by next Wednesday, he believed there was some danger of a lock-out all over the country, not only in the plastering trade, but in the whole of the building trade. The masters did not wish for strikes, but they could not stand it any longer. Something must be done for the welfare of the country, and to stop these obnoxious clauses.

**Trade Union Federation.**—The Parliamentary Committee of the Trade Union Congress has decided to resolve itself into a provisional committee for the formation of the new Trade Union Federation decided upon by the congress at Manchester last month. The committee elected the following officers: Chairman, Mr. Davis; vice-chairman, Mr. Wilkie; treasurer, Mr. Inskip; secretary, Mr. S. Woods, M.P.; trustees, Messrs. C. W. Bowerman, F. Chandler, and W. Thorn. The rules were carefully gone into and approved, and it was decided to circularise every trade union in the country inviting affiliation with the new federation. The committee will meet again in May, to make arrangements for placing the Federation on a permanent basis. Not all the Unions will seek affiliation, but it is tolerably certain that, amongst others, the Amalgamated Society of Engineers and the Carpenters' and Joiners' Society will do so.

**An Eight Hours' Working Day and its Results.**—At the eighth annual festival of the Thames Ironworks Federated Clubs, which was held at the Town Hall, Canning Town, on

February 6th, Mr. A. F. Hills gave some remarkable details, showing that in the case of his firm, at any rate, the eight hours' day had proved an unqualified success. In 1892 it was decided that everybody should have an interest in the work that he did, by means of a good-fellowship dividend, which should depend upon the realised profits of the firm. In 1892 the amount distributed was £4804, and in 1898 it was £15,890. During the seven years 1892-8 it amounted to £42,519. This was in addition to the highest wages in the trade in this or any other country for an eight hours' day. In 1894 Mr. Hills decided to introduce an eight hours' day. In seven years there had been an increase of wages paid of 145 per cent., which was a very remarkable testimony to the working of the eight hours' day, and showed that the work done was becoming more profitable. He had taken out the net cash per ton of five vessels built for the Government before the eight hour day had been introduced, and the cost for two Japanese battleships and a cruiser for the British Government after, and he found that the latter were built at a cost per ton of seventeen or eighteen per cent. less than the former. And during the past two months the Thames Ironworks had, in open competition, secured work at the price which was the lowest put in by any firm. So greatly had their business increased that they had taken a yard over the river, to which they intended to transfer the eight hours' flag, which had brought nothing but blessing on them since it had been adopted. It had proved good for the men, good for the work, and good for the shareholders.

**Nottingham Master Builders.**—The annual dinner of the Nottingham Master Builders' Association took place last Friday. Mr. Enoch Hind presided. The speeches dealt largely with the relations between employers and employed. The Chairman said that during the past year the membership of the Association had increased by 31. They had had 140 meetings during the twelve months, and the members on the books to-day were 99. There had been some differences with the architects and with the men during the year. At its beginning there was a strike with the labourers, and, of course, the old song again—the bricklayers were in sympathy with them. There was only one thing—the Association had to give way to it because work was good; but he was sure that so long as they remained banded together they would go on progressing.—Mr. George Fish observed that, although the Association had had several difficulties to contend with, they had been amicably overcome. They had met the bricklayers on several occasions, and the latter had met the masters in a fair spirit, and it was sincerely hoped that the plasterers' matter would eventually be settled without any deleterious issue.—Mr. Thomas Greenwood observed that the strength of the labour organisations was well known to all of them. If that strength were used for just and righteous purposes, for the improvement of the conditions of the working classes, without injustice to the rest of the community, they would wish them success. But when they saw those combinations not satisfied with their rights, and striving to injure the community in general, it was absolutely necessary for the welfare of the country that those who had the capital should combine. He referred more particularly to the advisability of unity in consideration of the action being taken in respect to the limitation of apprentices. The result would be they would be unable to get workmen, and the nation would suffer consequently.—Alderman Bowen, speaking of the work of the National Federation and the Midland Federation, over which he presided, remarked that they had not felt it to be their duty to carry on aggressive work against trade societies; they had aimed at greater things, such as obtaining proper forms of contract and better provisions generally. To protect their interests the Master Builders' Associations must take united action, and co-operate heartily one with another.

## Builders' Notes.

**Jarrah Blocks.**—The Poplar Board of Works have accepted the Tender of the Jarrahdale Jarrah Forests and Railways Ltd., for their contract for 1,300,000 Jarrah Blocks.

**Ventilators for Public Halls.**—In the erection of the Girls' Club Hall, Ferguslie, Paisley, in connection with the works of Messrs. J. and P. Coats Limited (architect, Mr. T. G. Abercrombie, of Paisley), great attention has been paid to the efficiency of the Ventilation, "Cousland's Improved Climax" Patent Continuous Exhaust Ventilators being used, supplied by the Climax Ventilating and Heating Company, 93, Hope Street, Glasgow.

**A Scaffolding Accident,** resulting in two deaths, occurred on Wednesday, in Lawnmarket, Edinburgh. Three slaters were engaged in repairing a chimney head, when the scaffolding slipped. Two of the men were precipitated into a court, 60ft. or 70ft. below, one being killed outright, while the second died whilst being conveyed to the Infirmary. The third man had a marvellous escape, falling on to a ledge a few feet below the scaffolding, and sustaining only slight injuries. The accident is believed to be due to a large copestone falling upon a "needle" used in supporting the scaffold.

**New Vauxhall Bridge.**—Messrs. Francis and Co., cement merchants and manufacturers, of Cliffe, Kent, and Vauxhall, have sought to recover the sum of £40,000 from the London County Council for the loss of business, stock, &c., by reason of the compulsory seizure of their premises, the Nine Elms Cement Wharf, for the New Vauxhall Bridge. The claimants estimated their annual profits at £8800 per annum, and claimed for three years' loss of trade. The special jury at the Sheriff's Court, Red Lion Square, assessed the damages at £24,126, being £13,563 for the leasehold premises, £9643 for damages to business, and £920 for fixtures, &c. Judgment was given accordingly, with costs.

**Christ Church, Birmingham,** was the scene of a terrible accident last week, resulting in one man being killed and six other men severely injured. The church is being demolished, and the work of removing the huge pointed steeple had been going on for several days past; a number of workmen were engaged on Wednesday in unroofing the edifice, when, about two o'clock in the afternoon, one of the main timber girders, weighing about 3 tons, suddenly gave way, and fell into the body of the building, crashing through the ceiling into the nave, a distance of 35ft. The force with which the beam descended was sufficient to break through the floor of the church into the catacombs underneath.

**Workmen's Compensation.**—Messrs. Waring and Gillow Ltd. write:—In view of the numerous discussions that have taken place as to the effect of the new Act on large employers of labour, it may be of interest to give our experience for the six months from July 1st to December 31st, 1898. The premium asked by the insurance companies was £2500 per annum. We considered this excessive, and decided to take our own risk. In the six months ending December 31st, although the accidents were more numerous than in any previous half-year, we only paid £93 as compensation, and have therefore £2407, plus interest, in hand for the following six months. We may mention that all the accidents occurred during the summer months, and that the worst one happened on July 1st, the day the Act came in force. Although we are employing a larger number of workmen than usual, we have not had a single claim since October.

**Memorial Hospital at Bulawayo.**—A correspondent of "South Africa" gives

some particulars of the progress of the work of extending the front of the Memorial Hospital at Bulawayo. The outside, it appears, is now practically completed. The rooms are bright, airy, and well ventilated, the ventilation being by means of Boyle's ventilating air pumps. Along the whole of the front under the roof and above the ceiling a main ventilating shaft will run on the top of which—on the roof—six of the patent air pumps are to be placed, three on the old, and three on the new front, respectively. From those rooms that are not directly ventilated by the main shaft a connecting shaft will be run to the former. Another special feature introduced by Messrs. Benzie and Doble in the ventilation line is the provision of an opening two inches wide all round the building between the roof and the brickwork, the opening being protected from the weather by eaves which project about a foot. The general ward is a very fine room 83ft. long, 24ft. wide, 14ft. to the ceiling, and another 13ft. to the pitch of roof. It is splendidly lighted and ventilated, and affords 1500 cubic feet of air space to each patient. The architect considers that the ward is equal to any to be found in the best hospitals at home.

**Border Counties Master Painters' Association.**—The Annual Apprentices' Competition and Exhibition, under the auspices of the Border Counties Master Painters' Association, was held in the Burns Hall, Galashiels, last Saturday week. The competition was conducted on entirely new lines, the competitors being put to a thorough test of their merits in the hall under the superintendence of Mr. Brown, Dundee, President of the Master Painters' Association of Scotland; they were divided into three grades, the first being for fifth and sixth year, the second for third and fourth year, and the third for first and second year apprentices. The theoretical test was first applied, after which the practical work was carried through, the tests being oak graining, plain, raised, and shaded letters, two hours being allowed for each subject. The annual business meeting of the Association was held in the Douglas Hotel in the afternoon, Mr. T. C. Russel, Kelso, presiding. The treasurer's report showed a favourable balance of £9 10s. 3d. Office-bearers were elected for the ensuing year as follows:—President, Mr. H. M. Tait, Galashiels; vice-president, Mr. J. M. Bell, Galashiels; secretary and treasurer, ex-Bailie Laidlaw, Hawick. The next annual meeting and competition was fixed to be held at Galashiels.

**A Dispute about Mortar.**—On Wednesday, the 1st inst., in the Queen's Bench Division of the High Court of Justice, the case of Smith v. Johnson, which was an action to recover damages for breach of contract, was decided by Justice Bruce. The plaintiff, a lodging-house keeper in Whitechapel, was building a dormitory to one of his lodging-houses, and contracted with the defendant, a builder and contractor, to supply the mortar. The mortar was supplied, and the building erected. After the building had been erected the plaintiff was served with a notice from the County Council to pull down and rebuild, on the ground that the mortar was not in accordance with the requirements of the Building Act, 1894, which requires one part of lime to three parts of grit or sand. The plaintiff sought to recover from the defendant the whole cost of pulling down and rebuilding, and also the loss of ground rent. It was proved that the mortar was defective, and the learned Judge found that it was so supplied by the defendant. The plaintiff also proved that in a wet state the inferior quality of the mortar could not be detected.—Counsel for the defendant argued that the damages were too remote. If the defendant supplied bad mortar, the plaintiff should have rejected it. (9 Q.B.D., 582.)—Counsel for the plaintiff contended that the test was whether the defective quality of the mortar could have been detected before being used.—Mr. Justice Bruce held that the question was whether the plaintiff, by reasonable diligence, could have discovered the defects in the mortar before using it.—Judgment was given for the plaintiff for £101.

Engineering Notes.

**The Bristol Tramways Company** have been urged to extend their light railway to Hanham.

**Electric Traction for Greenock.**—The plans of the power-house prepared by Mr. Fedden, the engineer, to be erected at Hunter Place, have been approved.

**The Dundee Institute of Engineers** held their monthly meeting on Thursday in Lamb's Hotel. Mr. J. R. Henderson occupied the chair, and there was a fair attendance. Mr. David Peat delivered a lecture on "The Consumption of Coal for Steam-Raising Purposes."

**Birmingham Tramways.**—At a meeting of the Public Works Committee of the Birmingham Corporation on Thursday, it was decided to recommend to the Council the municipalisation of the tramways. The question of the method of traction has not yet been decided. At present electricity by the accumulator system is only used on one of the eight routes, the cable system on another, and steam on the remainder.

**The Channel Tunnel.**—In the absence of Sir Edward Watkin (the chairman) Baron d'Erlanger presided on January 30th at the half-yearly meeting of the Channel Tunnel Company, and in moving the adoption of the report said it would be taking up their time uselessly to set forth the reasons why they had not been able to make progress with their scheme. They hoped, however, that times would change, and that public opinion would enable them to get that which alone would enable them to carry out the work, viz., an Act of Parliament.

Surveying and Sanitary Notes.

**A Sewage Improvement Scheme at Evesham** is proposed at an expenditure of about £2500.

**Wood-paving for Brighton Front** is under consideration by the Works Committee of the Corporation.

**Morecambe District Council** proposes to borrow £4100 for the purposes of street improvements, and a Local Government Board inquiry was held last Thursday.

**Sewage Scheme at Barnsley.**—The Local Government Board have held an inquiry at Barnsley into a proposal to construct sewerage and sewage disposal works for the township at a cost of £3900, in accordance with a scheme of sewerage and treatment prepared by Messrs. Lomas, Bolton.

**Edinburgh Improvements.**—It is proposed to improve the Portobello promenade and sea beach at Edinburgh. The total estimate for the improvements is £90,000, of which £40,000 is required for widening the promenade to admit of the formation of a carriage drive as well as a pedestrian promenade along the sea frontage; £13,000 for the interception of the sewage at present discharged at various points along the beach, carrying it eastwards beyond Portobello, and discharging it into the sea; £7000 for the extension of the promenade; and £30,000 for the construction of a harbour for yachts. The cost of such a scheme, the burgh engineer regarded as prohibitive, but the widening of the promenade in the way indicated would

completely remove all complaints as to the fouling of the bathing beach.

**Who Owns the Subsoil?**—In the Court of Appeal on January 30th, the case of the Vestry of St. Mary, Battersea, v. the County of London and Brush Provincial Electric Lighting Company, was argued before the Master of the Rolls and Lords Justices Rigby and Vaughan Williams. This was an appeal against a decision of Sir F. Jeune, President of the Probate Division. The defendants had opened and broken up the footpath in Trinity Road, Battersea, within the plaintiffs' district, for the purpose of laying their cables at a depth of about 2ft. It was at first denied by the defendants that they had acted wrongfully in breaking up the footpath, but they ultimately admitted that they had, and the only question remaining was whether, the work having been completed, the plaintiffs were entitled to a mandatory injunction. This depended upon whether, by reason of their wires being in the subsoil, the defendants were trespassers upon an interest of the plaintiffs. This raised the question whether the plaintiffs had any property in the subsoil of the street, whether their property extended beyond the surface, and so much below it, as was necessary to the maintenance of the street as a street. The learned President held that the plaintiffs were entitled to a mandatory injunction, and against this decision the defendants appealed.—After hearing the arguments of counsel, the Master of the Rolls said he was bound to come to the conclusion that the plaintiffs had not made out that any right of theirs would be interfered with by the continuance of the defendants' pipes and wires where they were.—Lord Justice Rigby and Lord Justice Vaughan Williams concurred.—The Court accordingly allowed the appeal, and dissolved the mandatory injunction, but gave no costs of the appeal.

Kindred Interests,

on the FIRST and THIRD THURSDAYS in each month throughout the year, at the MART, Tokenhouse-yard, E.C.

The following are the appointments fixed for 1899:—

February 16th	June 1st	September 21st
March 2nd	June 15th	October 5th
March 16th	July 6th	October 19th
April 6th	July 20th	November 2nd
April 20th	August 3rd	November 16th
May 4th	August 17th	December 7th
May 18th	September 7th	December 21st

Offices, 6, Poultry, London, E.C. Telephone No. 999 Bank.

**SURREY.—CHOICE BUILDING ESTATE.**—In a charming district, two miles from Horley station (L.B. and S.C. Rly.) under one hour from London and adjoining a village where are church, shops, and post-office; two miles from Roman Catholic Church.

FOR SALE, a compact and valuable FREEHOLD PROPERTY of 53 acres, with a frontage to the main Brighton road of 2000ft., and perfectly ripe for development, with residences of a good class. Prettily timbered. Gas and water mains along the frontage. Would be divided.

Plans and full particulars of the owner's agents, Messrs. GREEN and SIMES, Auctioneers and Estate Agents, Blenheim Mansions, Queen Anne's-gate, London, S.W.; or Mr. W. M. LEACH, Auctioneer and Estate Agent, Crawley, Sussex.

**FAIRMILE PARK**, near Cobham, Surrey.—A FREEHOLD BUILDING ESTATE of about 40 acres, with possession.

**MESSRS. DRIVER and CO.** have received instructions to offer to AUCTION at the MART, Tokenhouse-yard, Lothbury, NEXT SPRING (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairmile Station, and about a mile and a half from Cobham Station. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) possessing charming views over the intervening country to Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and will be included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of CHARLES JUPP, Esq., Solicitor, 48, Lime-street, E.C.; and of Messrs. DRIVER and Co., 23, Pall Mall, S.W.

By order of Trustees.—Preliminary Advertisement.—Freehold Building Estate, Streatham, near West Norwood Railway Station.

**MESSRS. FIELD and SONS**, and Messrs. WALFORD and WILSHIN, who are jointly concerned, will SELL by AUCTION, at the MART, at an early date, a valuable FREEHOLD BUILDING ESTATE, known as High View Park, comprising 16a. 1r. 10p., lying immediately at the rear of and with approach from Leigham Court-road; also a contiguous Freehold Building Site of 2a. and 5p. in a new road intended to connect Canterbury-grove with Thurlby-road.

Particulars and plan, in due course, of Messrs. KINGSFORD, DORMAN, and Co., Solicitors, 23, Essex-street, Strand; of Messrs. WALFORD and WILSHIN, Auctioneers, Anerley, S.E.; and of Messrs. FIELD and SONS, as above.

**LEA VALLEY, PONDERS END**, and **BROXBOURNE**.—Freehold Wharf and Building Land, the latter with possession, some of which has been included in the schedule of the land required by the East London Waterworks Company.

**MESSRS. NORTON, TRIST, and GILBERT** will SELL by AUCTION, at the MART, Tokenhouse-yard, London, E.C., on TUESDAY, FEBRUARY 28th, 1899.

LOT 1.—8 acres 0 rods 11 perches of Land, with a frontage of 500ft. to the Lea and Stort Navigation Canal, also bounded on the north and east sides by the stream. This land is situate immediately opposite the Corticine Floor Covering Works, Ponders End, and is a fine site for the erection of a factory requiring waterside accommodation. It is in the occupation of Mr. Ives. This land has been scheduled to be acquired for the New Reservoir for which the East London Waterworks Company are applying for Parliamentary powers.

LOT 2.—14½ Acres of Freehold Building Land, with a frontage of 1080ft. to the road, close to Dobbs Weir, and within one and a half miles of Broxbourne Town and Station, now ripe for building purposes, possession of which can be given on completion of the purchase.

Particulars and conditions of Sale may be obtained from the Senior Official Receiver in Bankruptcy; of Messrs. CLARKE, RAWLINS, and Co., 66, Gresham House, London, E.C.; at the MART; and of the AUCTIONEERS, 70, Queen-street Cheapside, London, E.C.

To Land Syndicates, Building Societies, Capitalists, and others.

**PINNER**.—Important Freehold Building Estate of over 47 acres, with residence, known as Barrow Point, occupying a beautiful position close to the quaint old village of Pinner, within five minutes from the railway station on the Metropolitan line, and extending to within about ½ of a mile of Pinner Station on the London and North-Western Railway, having easy access from the West-end and City. The whole ripe for immediate building operation, and admirably adapted for villa residences of a superior class.

**MESSRS. FAREBROTHER, ELLIS, EGERTON, BREACH, GALSORTHY**, and CO. beg to announce that the above valuable PROPERTY, which they recently offered for Sale by Auction, may now be treated for privately.

No. 29, Fleet Street, Temple Bar, and 18, Old Broad Street, E.C.

**TO CONTRACTORS, CAPITALISTS, and OTHERS**.—Valuable Quarry, Light Railway, and Mines, situate in South Wales, to be sold as a whole.—For further particulars apply to J. W. DAVIDSON, COOKSON, and Co., 6, Castle Street, Liverpool. 2

## THE SANITARY INSTITUTE.

LECTURES AND DEMONSTRATIONS FOR SANITARY OFFICERS.

The TWENTY-SEVENTH COURSE OF LECTURES will be held at the Parkes Museum, Margaret-street, W., on MONDAYS and THURSDAYS, commencing FEBRUARY 20th.

The course includes, in addition to the lectures, a number of Practical Demonstrations and Inspections at Places illustrative of Sanitary Practice and Administration.

Full particulars can be obtained at the Offices of the Institute, Margaret-street, W. 1

**SANITARY INSPECTORS' EXAMINATIONS**.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E. 13

**ANSELL and MALLOWS**, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C. 1

**R. I. B. A. EXAMS. PREPARATION**, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum)

**R. I. B. A., SOCIETY of ARCHITECTS, and R. I. B. A. CIVIL SERVICE TECHNICAL EXAMINATIONS**. Preparation by correspondence, in residence, or personally.—MIDDLETON and CARMEN, 19, Craven-street, Strand, W.C.

## PERSPECTIVES.

E. BECKITT LAMB, 31, Craven-street, Charing Cross, W.C. 1

## APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**WANTED**, Architectural and Engineering ASSISTANT, thoroughly conversant with design, specifications, estimating, surveying and levelling, together with some knowledge of modern steel construction.—State age, experience, and salary required, to "Superintending Engineer," H.M. Dockyard, Devonport. 1

**ORDER and CORRESPONDENT CLERK** WANTED.—One with a knowledge of Book-keeping and Building or Engineering trades preferred. Apply, stating salary required, experience, age, &c., Box 973, BUILDERS' JOURNAL. 1

**WANTED**, at once, JUNIOR ASSISTANT. Quick draughtsman, good at construction, details, and neat tracer. State salary, age, and experience.—HERBERT C. SCAPING, Architect, Grimsby. 1

**WANTED**, immediately, WORKING FOREMAN for New Concrete Paving Works near Leicester; must be thoroughly competent.—Apply, stating wages required, to Box 975, BUILDERS' JOURNAL Office. 1

## APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**YOUNG ARCHITECT, A.R.I.B.A.**, ASSISTS in the PREPARATION of DRAWINGS, TRACINGS, &c., at his own Office. G. SCORER, 25, Newman-street, W.

**WANTED, ENGAGEMENT** in Architect's or Builder's Office; shorthand, tracing, and general routine.—27, Paddington Green, W. 2

**SURVEYOR or ARCHITECT'S ASSISTANT** requires RE-ENGAGEMENT. Nearly ten years' experience. Quantities, specifications, drawings, &c. Good reference.—Apply, Box, No. 971, BUILDERS' JOURNAL. 3

**ADVERTISER** seeks JUNIOR POSITION in architect's office. Small salary commencing. Country preferred.—Address, C. H. LEWTON, Clifton, Biggleswade. 1

**QUANTITIES** prepared, specifications written, works measured, and variations adjusted by reliable London Surveyor. Over twenty years' experience. Special terms by arrangement.—"Surveyor," office of the BUILDERS' JOURNAL. 46

**QUANTITY SURVEYORS**.—Temporary Assistance rendered in taking-off, measuring, &c., either by the hour or commission.—Reference given. "H.R.A.," 30, Fontarabia-road, Clapham Common. 3

TELEGRAMS: "LONDON" TELEPHONE No. 1011, Holborn.

## An Architectural Causerie.

Vistas.

As the accompanying illustration is typical it has been selected out of a number which might appropriately accompany this short paper. There has already appeared in this journal an article entitled "Church Restoration in Norfolk," which referred in particular to what they want to have done at Worstead. I said among other things that I thought it of more importance to restore the congregation to the church than the church in its original state to a mere handful of regular attendants whose numbers may be estimated roughly by considering that the entire population of Worstead consists of scarcely 800 people, and it was in my mind to add that part at least of the sum raised should be spent in clearing the space roundabout in order that we may be able to see of the church as much as our fathers saw; and this, being pure restoration, is less likely to be objected to than the architect's designs on the structure. Let us turn from Worstead to London, and consider what, to this end, we are doing; for here within the last year or two nearly the whole *entourage* of the Abbey has been cleared, with the result that the revelation of its loveliness becomes more complete, and in fact there is hardly a building "hallowed by Time" that is not being, or likely to be restored, as to its aspect, in this lordly and generous way. If only for health's sake the furnishing of more and more open spaces is seen to be necessary, and whensoever it appears to be possible to effect a clearance round really beautiful buildings there is in the fact that we love them an additional reason for action. On the other side is the great question which cannot be entered on here, of better lodging for as many as must be ousted. I have headed this article "Vistas," and illustrated it by showing what faces the Market Place in the sweet and dear little town of Aylesham in Norfolk. Now at Worstead there is in the Parish Church an equally handsome porch, which is entirely hidden from sight by insignificant buildings that to serve some temporary purpose have gathered about it. If you think to enjoy the south view of this church you must traverse a narrow lane that runs alongside, and between this lane and the church are these unsightly erections. There be two thousand pounds wanted here. Let the congregation be restored; the money will come sure enough, and there will at the same time be rekindled something like a municipal sense of devotion to the most appealingly beautiful thing in the place. "Cabined, cribbed, and confined" as we are here in London, the disposition to dream of open spaces, vistas, and avenues becomes general—so general indeed that no one expresses surprise when an architect talks in his sleep of what would delight our eyes were a full view of the British Museum to be obtained from Waterloo Bridge, nor when the gifted author of a popular book on architecture diverts his readers with tales of a day in the distant past when from his own front door in Gower Street he looked without let or hindrance on the mainpots of Hampstead Heath. E. R.

ANYBODY who is acquainted with the furniture gallery at South Kensington Art Museum will remember the collection of English chairs arranged in the North-West Corridor. Here are to be found Jacobean chairs, chairs in the Dutch manner, and, arranged chronologically, Queen Anne chairs, then Frenchified chairs, then Chippendale's Gothic and Japanese chairs, then chairs by Sheraton, then others by Hepplewhite and Adams, then a chair labelled "English chair, early nineteenth century," then—nothing.

present century. For the benefit of those who have not remarked the chair in question, one will attempt a brief description. It assumes to be mahogany, and perhaps it is—you are requested not to touch it. The back is composed of a waved strip of wood of an equal elliptic section, which springs out in continuation of one back leg, shoots up and round in a frantic wriggling loop, and dives into the other. The intervening space is apparently laced across; and is stuffed and upholstered to match the seat. The front legs have a meaningless curve of contrary flexure, and suggest weakness and knock-knees. The lines of the seat, which is upholstered

SOUTH PORCH, AYLSEHAM PARISH CHURCH.

After 1801 classification apparently breaks down, chairs, to all appearances, ceased after the year 1801, and upon the evidence of this last particular specimen they ceased very soon after that date. This example acts as a tail-piece to the history of chairs as exemplified at South Kensington Museum. It at once explains and justifies the discretion of the Museum authorities in pursuing the subject no further, and would seem to have been set in the gallery merely to suggest to the student the nature of the calamity that befell furniture during the first half of the

in some patterned velvety fabric, are also waved curves. The design expresses no comfortable utility, and no beauty. All its lines recall the scrawled curves of the lightning caricaturist. It looks as if it had been made against time for a wager, and it has no individuality beyond the insufferable nineteenth century quality of "gentility." It would group well with a stuffed lap-dog in a glass case; it seems to pine for an antimacassar; it recalls that atmosphere of prosperous-domesticity which Dickens has typified in the inimitable phrase "Saddle-of-mutton

vapour bath." That is all. Now, there must be a substantial reason why in an interval of only some thirty years popular taste should have ceased to favour chairs of thoughtful and beautiful design, and accepted a pattern of furniture which is recommended by no qualities either of usefulness or comeliness; and this is a particularly interesting speculation, because, although we may reasonably hope that our great-grandchildren will find the history of chairs revived again in our museums with examples dating from about the year 1900, we have as yet not emerged from the decadent epoch which flourished in the mid-century. Mr. Frederic Harrison, in his "Studies in Early Victorian Literature," has shown that the century will always be distinguished for its scientific and sociological progress almost to the exclusion of its purely literary and artistic achievements, and in this materialistic quality of the age we may find also the reason for the derogatory impulses from which we are only now beginning to recover. Steam power has been the chief factor in producing this condition. The invention of machinery, the whirl of commercial activity it induced, the huge fortunes made by the ingenuity of mechanics and the enterprise of capitalists, the resultant hurry, the fever, and the desperate competition in cheapness plying the public with showy imitations, demoralised and betrayed the arts and the handicrafts. In "Aratra Pentilici" Mr. Ruskin refers to a letter he once received from the owner of a large mason's yard, inviting him to visit the mason's establishment, and satisfy himself how much better and more quickly stone could be "roughed out" for the carver by machinery than by manual labour. The author's characteristic comment is that he would as soon go to see the Oxford and Cambridge Boat Race rowed by automata. For all this a positive degeneration in the Art ideals of the nation, though it may find a certain apology in the birth of steam, is not excused thereby. Although the parts of a piece of furniture are prepared by aid of machinery, that is no reason why the piece should not be thoughtfully designed; nor why it should not be properly and strongly constructed; nor why its lines should not be beautiful. Steam power and its accessories wrought the decay of craftsmanship and the popular discernment of the beautiful, rather by the overwhelming commercial activity and vulgar money-getting instincts it engendered, than by any direct essential of the new tool. If Thackeray had been born thirty years later than he was it would have been the snobbery of wealth rather than the snobbery of rank that would have prompted his satire. The tyranny of steam and machinery has effected such a radical change in the popular taste that it may be said to have bred a new aesthetic sense with the general public. This dictates that whatever thing, or part of a thing, assumes to be square must be die square if it is to be commended; or if circular it must clearly be the circle as turned with compasses; a tool-mark is by these considered a flaw; the turned legs of a table, or a pair of any two things, must be indistinguishable to pass muster; and we may observe in the work of the ordinary sign-writer a natural aptitude, and a practiced skill, which prompts him to emulate the hard mechanical curve, which is achievable with simple mathematical appliances, and to secure a rigidity and equality in his parts which shall defy test by scale and dividers. H. B. C.

**The Vandyck Tercentenary** is to be celebrated at Antwerp in August next. In connection with this event 1,000,000 special postage stamps will be issued, which will bear as part of an elegant design a portrait of the great painter.

## On Reflection.

### The Leighton Bequest.

THE ROYAL ACADEMY has at last decided to spend the income derived from the fund bequeathed to the Academy by Lord Leighton on his death to acquiring or commissioning works of decorative painting, sculpture, and Architecture. The steadfast attitude of conservatism which characterises the Academy in matters pertaining to Art has rarely expanded to such a vigorous initiative as that indicated by its late decision. It is decided by the Academy that Lord Leighton's bequest shall be applied to the decoration and beautifying of public property, and this is an influential step towards restoring Art to its true place as a factor in beautifying and ameliorating the familiar life of the people. In England hitherto Art has been a thing associated with picture galleries and museums, and has come to be regarded as an extraneous product of civilisation, instead of an essential privilege of mankind whereby the harsh and prosaic routine of life may be crowned with grace and nobility. Thus it has come about that in our metropolis we have ludicrous anomalies and contradictions pressed together. We find the Elgin marbles and Tottenham Court Road furniture stored cheek by jowl, and it would be difficult to say which calls for the greater admiration. People will live a month surrounded with execrating vulgarities of taste, visit a picture gallery, and return again with perfect equanimity to their wool mats, chandeliers, and steam-turned ornaments. By the usage of galleries and museums, the test and noblest prerogatives of both painting and sculpture—namely, to decorate and give complete expression to noble buildings—are almost entirely overlooked. Lord Leighton's bequest will provide some £300 per annum, which is to be expended upon lamp posts, fountains, sculptures, and paintings, decoration of public and national sites and buildings. There is surely no more direct or plausible method of educating the public taste to the full significance of Art, than to apply it to the beautifying of the common surroundings of their daily life.

### The Irresponsible Councillor Again.

MR. GEORGE H. WILLOUGHBY, F.R.I.B.A., deserves the thanks of the Profession for his action in calling public attention to the Architectural competition lately advertised by the Knutsford Urban District Council, by the letter of protest which lately appeared above his name in the "Manchester Courier." "Surely," says Mr. Willoughby, "throughout the history of Architectural competitions no competition has ever been issued more grotesque or ludicrous," and though, in view of the irresponsible junkettings of Urban and Municipal councillors, which characterise the conduct of most competitions, this is a daring statement to make, we think it cannot be far from true. The subject is the Knutsford Cemetery Chapel, to cost £4000. Mr. Willoughby makes no mention of any premiums being offered, and we assume there are none. No professional assessor to assist the Council is promised. The Council reserve the right to exclude any design which seems to them too costly or to be otherwise unsuitable. In order to raise up competitors from the heavy dejection occasioned by this depressing statement, the Council, however, promises, in the event of no design being considered suitable, to make amends by having another competition; and, we presume, upon the same conditions! The 5 per cent. commission paid to the appointed architect is to include the quantity surveyor's fees. Finally, although hitherto

we have all considered strict anonymity, or an assumption of it, to be the one essential of a "competition," the Knutsford Urban District Council have taken it upon themselves to change all that, and have made it a condition that all plans must be sent in *with the author's name attached!* It will be seen from these facts that the Council has exempted itself from all essential obligations; and has stultified, in its "conditions," the fundamental principles which constitute a competitive test of any sort.

### A Useful Society. for Checking the Abuses of Public Advertising.

THE National Society, to whose activity is due the circulation and presentation of the late memorial to the L.C.C., has for many years been doing a quantity of useful work in a quiet, unostentatious way. In many instances it has succeeded, by appeals and representations, in impressing advertisers with the offensiveness of their methods, and has thus succeeded in modifying or averting some of the more extravagant contrivances which have threatened to deform the metropolis of late years; it has, further, by calling general attention to notorious trespasses upon public decency and rights of citizenship; and by judiciously exploiting the views of persons of culture upon the subject of advertisements, kept alive the distaste with which the encroachments of advertisers were originally regarded, and has thus prevented the usage from finding general acceptance as one of the essential conditions of life in the present age. The Society has acted with praiseworthy discretion in refraining hitherto from hastening to extreme measures which might alienate the general public from sympathy with its motives, but it is now time for a decisive action to be taken, and it will be strange if the moderate and reasonable suggestions set forth in the memorial do not effect some substantial addition to the laws governing public advertisements. Previous to his investiture with the honours of the Laureateship Mr. Alfred Austin was president of the Society, and used to contribute verses ridiculing the assumptions and vulgarity of modern advertising tradesmen and manufacturers. In Mr. Waterhouse the Society has a no less influential and enthusiastic president.

### School Board Economies.

WE referred some weeks ago to the "Conditions" of the competition organised by the Dartford School Board. It will be remembered that monstrous as the requirements of these "Conditions" were, would-be competitors had to pay a guinea per copy for them. The proposed schools were to cost about £14,000, but the total sum offered by way of premiums was £42, or less than one quarter the amount usually offered for designs of this value. We have now learned that thirty-six intending competitors tendered their guineas, for the "Conditions" in spite of the warning published in this and other journals. Our readers will observe that the amount thus received by the Board nearly equals what it proposes to pay away in premiums! It is true that the Board undertakes to return the guinea in each case where a *bona fide* design is submitted. In this instance, however, the terms of the conditions make such a monstrous imposition upon the competitors that a small percentage of them only could be expected to submit designs. The comparatively small number of thirty-six applicants is no doubt due to the conspicuous warnings published in the professional journals. But for these warnings there can be little doubt that many more would have applied for the conditions, so that the competitors would have paid the premiums out of their own pockets.

ST. PETER'S CHURCH, LEIDEN. DRAWN BY H. F. WARING.

## THROUGH HOLLAND.

BY H. F. WARING, ARCHITECTURAL ASSOCIATION TRAVELLING STUDENT, 1898.

**A**RRIVING as I did at the Hook of Holland one misty, chilly morning in June, my first impressions were not of the most cheerful description. A low, flat country, with here and there a stunted tree, was all that was visible; but as the mist gradually disappeared on either side of the river leading to Rotterdam, objects of interest to architect and artist alike began to show themselves. Schiedam, with the fine canal leading to it, was soon passed; this village, though picturesque in the extreme, does not boast of much in the way of buildings. Presently the river began to assume a busier aspect, small tugs rushed to and fro, whilst at the quays huge barges laden with timber awaited a convenient tide to get under way. Rotterdam is now seen standing out boldly in the grey morning, and we are soon at the wharf. With a rush which the 21st Lancers might have envied, the porters are upon us, climbing over the bulwarks in a truly heroic manner, seizing any article they can lay hands on, unless the owner of the same objects in a more forcible than polite manner. The tips they demand for their portage are extortionate in the extreme, and twice I had the equivalent of fourpence returned me as being an insufficient fee, which I promptly pocketed, much to the encouragement of bad language on the part of the aforesaid porter.

Rotterdam is undoubtedly a fine town, though most of its buildings are comparatively modern. The older portion of the city, Rotterdam proper, mentioned in 1272 for the first time as a town, lying upon the right bank of the Maas, near its confluence with the

Rotte, is certainly interesting to the student. Canals run parallel with and adjoining most of the roads, on the banks of which trees are planted, giving a decidedly pleasant appearance to the town, though the odours from the canals are not quite of so pleasing a nature.

The viaduct, connecting the Antwerp and Amsterdam lines carried across the town in 1870-77, is one mile long and a considerable triumph of engineering skill. It has a double line of rails and is supported by cast iron piles, between every two of which stands one of solid masonry. The average span of the arches is 50ft. The Church of St. Lawrence calls for attention. This dates from 1477, and is of brickwork, the choir stalls and some tombs inside are interesting, while a bronze screen separating the choir from the nave (1711-15) is good. The Groote Kerk, fifteenth century, is a large building, but not very beautiful; a view from the tower, however, amply repays one the climb. The picture gallery was unfortunately destroyed in 1869, and the collection there at the present time is uninteresting. Not the least pleasant feature here is the park on the outskirts of the town, where an excellent band plays in the evenings.

The Hague, about half an hour's train journey from Rotterdam, boasts only a few old buildings. As, however, this town is the Paris of Holland, it is not to be wondered at that more modern buildings have in many cases taken the place of the old. The Hague at one time was distinguished as being "the richest village in the world," but when Napoleon became King of Holland he converted it to the rank of city. Up to the commencement of the present century it neither returned members nor possessed a Corporation. I was fortunate in being here at the coronation festivities, for which many grand stands lined the streets; these were

rickety in the extreme; I do not know whether they were inspected by the town surveyor, but am sure they would never have been passed by our own County Council judging by the many stands that were condemned by them at our jubilee of last year.

The Groote Kerke, a late sixteenth century edifice, with a hexagonal tower, and the Town Hall built in 1565, with its interesting two side-façades, are well worth visiting, whilst the admirable picture gallery, containing amongst many other pictures the famous Rembrandt's "Lesson in Dissection," and Paul Potter's Bull, call for admiration.

A day's visit to Scheveningen from here repays one; the journey can be made by steam tram through a delightful country. This is the Brighton of Holland, the greater part being quite modern. A small fishing industry is still carried on, however, and many quaint costumes will be noticed.

Leiden, about ten miles away, is one of the oldest towns in Holland, and is certainly not one of the least beautiful or interesting. The town is placed in the midst of a beautiful country, which has all been reclaimed from the sea. It is interlaced throughout by innumerable artificial waterways, which languidly flow throughout the town. Picturesque old sixteenth-century houses border these, for the most part leaning at a considerable angle outwards, whilst gaily painted barges ply up and down the canals.

The siege of Leiden will ever be remembered as one of the most terrible in the annals of history. The inhabitants held out against the Spaniards for four months without murmuring. For seven weeks bread and every kind of wholesome provision had been exhausted. As an almost inevitable consequence, in a town disorganised and badly drained, pestilence followed in the wake of

famine. Not less than 6000 of the inhabitants were then carried off, and those who remained were worn out with fatigue and emaciation, and the mournful duty of burying their dead. At last the Prince of Orange determined to cut the dykes of the Maas and the Yssel, and thus bring relief to the town. The inundation did not produce the anticipated results. Although the whole country was submerged between Gouda Dort, Rotterdam, and Leiden, the water rose only a few feet, and the flotilla could not reach the gates of the town. The inhabitants could see the boats, and were driven frantic at the sight of relief so near to them and yet so far off. Maddened by disappointment and suffering, they approached the burgomaster and demanded bread or the surrender of the town.

The burgomaster had not the one, and indignantly refused the other, but offered his own body to be cut up in pieces for food if they chose it. This heroism brought the people back to their senses and devotion. Fortunately their misery was about to end. The wind, which for many weeks had been blowing from the N.E., changed to the N.W., and drove the tide up the river. It then shifted to the S., a violent storm arose, and the flood was driven upon the land with overwhelming force. The ramparts thrown up by the Spaniards were surrounded, and more than 1000 soldiers perished in the flood. The same tide which swept them away carried the flotilla of the Prince of Orange laden with provisions to the very gates of Leiden. And the town was saved. The deliverance took place on October 3rd, 1574, and the event may well be commemorated by the citizens as an evidence of Divine interposition in their favour. The wind at the end of three days changed again, and drove the water back from the walls of the town, thus perfecting the safety of both people and country.

There are at Leiden many interesting old public buildings as well as dwelling houses. Of the former the *Stadhuis* is perhaps the most noteworthy. This is a very fine example of Dutch Renaissance, having been erected in 1570. Stone is used throughout in its construction, the building itself being kept comparatively simple, whilst a large central gable and on either side a smaller one are highly ornamented. A very ornate external staircase leads to the main entrance on the first floor. Some very good carved wood panelling will be noticed in the interior, and an inscription here referring to the year's seige before mentioned reads when translated as follows. "When the black famine had brought death on nearly 6000 persons, then God the Lord repented of it, and gave us bread again as much as we could wish."

Upon an artificial elevation, in the centre of the city, rises a tower of unknown antiquity. By some it is considered to be of Roman origin, while by others it is regarded as the work of the Anglo-Saxon Hengist, raised to commemorate his conquest in England. This has been considerably restored, though in a somewhat unsatisfactory manner. A house near the tower bears an inscription to the effect that John Robinson, the leader of the first Puritan party, banished from England, lived, taught, and died here.

The Church of St. Peter, Leiden, erected in 1815, with double aisles, is the largest in the town. The lofty west tower unfortunately fell in 1512. This and the Church of Saint Pancras, a Gothic edifice of the fifteenth century, are perhaps the two most interesting buildings in the town. The latter is built on the site of an older edifice. Two curious pointed turrets running up the east and west façades, and projecting above the roof are curious, the space between these turrets being filled in by a large window of very delicate tracery.

I now decided to go to Haarlem. As it was a fine day I boarded one of the steam trams which run between most of the towns in Holland. However, it was for the last time, as, starting at 9 a.m., I did not arrive at Haarlem until 1.30, having taken four and a half hours to go a distance of sixteen miles. Had I not been greatly annoyed at losing time in this manner, it would have been ludicrous the way

the three cars were continually left stranded on the road, the engine leaving them, and either going into an adjoining shed for perhaps an hour at a time, or else disappearing on the horizon altogether.

Haarlem reached, however, delight again seizes the traveller. Surrounded by a forest through which the canals and paths wander, Haarlem is certainly a beautiful old town, and it is wonderful to think that years ago the site and surrounding country were under water. A vast lake was here, which gradually grew in extent until the sixteenth century, when the wind drove the waters forward and united them with those of several neighbouring lakes. For a time it was feared that North Holland would be turned into an island. As early as 1640 Leeghwater, a famous engineer, proposed the gigantic task of reclaiming it. He had already recovered at enormous expense, but with signal success, the Beemster Polder in North Holland, a tract of 18,000 acres. It was not until 1840 that the work of draining was actually undertaken. Twelve years were required to accomplish the task, and during that time it is estimated that a thousand million tons of water were pumped out, the works costing a million of money. The drainage is now carried on by three huge engines, constructed at Hayle Foundry, in Cornwall. It is said that the drainage of the lake has affected the annual rainfall, increased the temperature in summer and lowered it in winter to the extent of half a degree. Holland has to fight not only against the inroads of the sea, but against internal waters as well. It is impossible to over-estimate the nature and importance of engineering operations that are constantly going forward, or the amount of skill brought to bear on them. In some cases the waters are 20ft. above the level of the surrounding country. Inundation takes place about once in seven years. Haarlem, like Leiden, underwent a siege by the Spaniards in 1572, but, unlike Leiden, it fell before the enemy.

The visitor here will be struck with the clean, wide streets and fine old buildings; the most interesting building is perhaps the *Groote Kerke*. This is a huge structure, cruciform in plan, erected at the close of the fifteenth century, with a tower 260ft. high. It contains some good choir stalls and a sounding-board to the pulpit (1432). Opposite the principal façade of the *Groote Kerk* is the Town Hall, begun in the thirteenth century. This was originally a palace of the counts of Holland, but was remodelled in 1620 and 1630, when a wing was added. A museum here contains some excellent pictures by Franz Hals, which are well worth visiting. In the same square is the Meat Market, erected by Lieuen de Key in 1602, which is perhaps the most remarkable building of its kind in the country; the effect of the combination of red brick with the projecting stone is excellent. On taking the road to Amsterdam, on the borders of the town one of the old *Portes* is seen. This is a graceful building of red brick, with the usual stone dressings. It was restored in the sixteenth century.

(To be continued.)

**Children's Homes** are to be erected at Out Lane, Huddersfield, to accommodate twenty children.

**A set of five windows**, including the whole of the west windows of St. Cuthbert's Church, Durham, have been placed in position, and were dedicated last Sunday week.

**The Thames and Electricity.**—The project for utilising the Nile for the purpose of generating electricity for use in Cairo has directed attention to the possibility of making the Thames do similar service for London. The idea is that by the construction of water wheels or by the fixing of floating turbines at the various bridges sufficient power to light the whole of the metropolis might be obtained by the simple action of the tides. In order to bring the subject to a practical issue a motion will be submitted at an early meeting of the London County Council for the holding of an inquiry by experts under the auspices of the Rivers Committee of the Council.

## HUMOURS OF BUILDING.

### II.—A WARM MORNING.

BY BULKELEY CRESWELL.

**Characters:** John Bump: a despotic tallow boiler; Mr. Bates: a worn and worried architect; Bolter: a clerk of works; "Uncle" Walker: a country builder; Bill Todd: his foreman. Bricklayers, labourers, &c., &c.

**Scene:** BUMP's brand new country seat in course of construction, upon a hot July morning. Bricklayers on a scaffold, with trowels in their hands, dozing; in the foreground labourers with spades, ditto. The work is at a standstill. A great slumbrous silence reigns. It is half-past eleven.

BATES discovered entering on a visit of inspection. He perceives the state of affairs and is much annoyed. At his approach the trowels and spades spring into motion, and the work of building proceeds with great activity.

BATES (to BRICKLAYER): Is Mr. Walker on the building, or Mr. Bolter?

BRICKLAYER (veiled at his disturbed slumbers, shakes his head): Dunno.

BATES: You are not levelling up properly after each course here, and you should use more water.

BRICKLAYER: Oh, well.

BATES: Well, what?

BRICKLAYER (turning on him): What yourself; take and glue the bricks—I don't care.

BATES: My man you must do what you are told.

BRICKLAYER (sulkily): I'm not going to argue with no toffs; if yer want to talk to someone go and talk to my foreman.

(Enter BILL TODD, fretful with heat and dust and broken slumbers.)

BATES (to TODD): They want more water there.

TODD (aggressively): Well, why don't they ask for it then?

BATES: I really can't tell you.

(TODD signs labourer to fetch water.)

BATES (to TODD): Why have you got all these men screening out that broken plaster and dust?

TODD: They're a looking for my spectacles.

BATES: Your spectacles!

TODD: That's it. I lost 'em last week somewhere on the job, and they're bound to find 'em if they screen all the rubbish out.

BATES (indignantly): But they must keep to their work.

TODD (angrily): Well can't yer see they're a-working hard as iver they can work. (He stares at BATES with one hand thrown out in direction of workmen and then walks off grumbling.)

(BATES looks at his watch, annoyed by the absence of WALKER and BOLTER. He stands and examines part of the building.)

(BUMP wanders in examining the progress of his house; he does not see BATES until he walks into him backwards.)

BUMP: O, there you are, are you?

BATES (nettled): Good morning, Mr. Bump. (Moves a few steps away.)

BUMP: It's some time since I saw you here, isn't it, eh?

BATES (in a tone of affected sweetness): Do you know I'm afraid we're going to have a change in the weather. (Examines a wall.)

BUMP: Oh you are, are you? Well, perhaps you'll answer my question?

BATES (looking over his shoulder): Beg pardon?

BUMP (growing red): I said, perhaps you'll oblige me by answering my question.

BATES (in a tone of nice discrimination): No. I don't think you said that, Mr. Bump. I don't think you said "oblige."

BUMP (his anger growing): Whether I did or not, perhaps you'll be good enough to answer my question.

BATES (raising his eyebrows): Which question

BUMP (*beginning to dance with suppressed rage*): I say — now — now — now, look here, Mr. Architect, I've had enough of this.

BATES (*quietly*): I've had too much.

BUMP (*with emphasis*): I say, you're not doing what I'm a-paying you to do. You're not acting up to my expectations.

BATES: I never accepted responsibility for your expectations.

BUMP (*sharply*): Eh? I asked for pretty architecture—didn't I ask you to do me pretty architecture?

BATES: Probably (*staring in front of him*).

BUMP: And do you mean to say you call that "pretty architecture"?

BATES (*looking at his watch*): Certainly not, the term is only used by amateurs.

BUMP: Oh! Didn't I tell you I wanted pink bricks.

BATES: I shouldn't be surprised.

BUMP: And do you call that a pink brick?

BATES: Of course not. I call it by its right name.

BUMP: Eh? Oh. Oh, you do, do you. Well look a here Mr. Architect—or whatever you are—I'd just have you to understand what I'm a paying you for. It's no good your telling me this here's pretty architecture. I tell you it AIN'T. (*Shouting: BATES assumes an expression of pain, and moves a step away, his hand over his ear.*) As if I didn't know what pretty architecture was. Didn't my father have the front of the tallow works pulled down and built up again and made pretty by the best architect in Wormwood Hollow, and pink bricks and little sausages all over, and his face done on blue tiles made a purpose, and flower pots too—and—and—didn't he?

BATES (*sighing and raising one hand*): I really can't say, Mr. Bump. I know very little of the history of tallow.

BUMP (*breathless, and rather puzzled*): Eh? Don't know the history of tallow. What do you mean?

BATES (*facing him for the first time, and tapping him on the chest with one finger*): I'll tell you what I mean, Mr. Bump, but once and for all. Please remember that. You should know that if I have my duty to you, I have also my duty towards my art.

BUMP (*breathless*): Oh—really—indeed.

BATES: It may surprise you, but no one can acquire taste in architecture by means of tallow.

BUMP: Indeed—Oh!

BATES: Yes. And it may astonish you, but if you were to live and boil tallow for a thousand years, it would still be a great impertinence in you to criticise my work.

BUMP: Oh! And may I—

BATES (*taking him up*): And I may remind you that you don't contradict your lawyer, and you don't contradict your doctor, and, Mr. Bump, you shall not contradict me.

(WALKER and BOLTER enter shame-faced, WALKER surreptitiously wiping his mouth, BOLTER concealing a pipe.)

BUMP: Oh!

BATES: Yes, and I mean it (*turns towards WALKER and BOLTER*). Good morning. (*He turns his back and seems to inspect an archway.*)

(Bump stares and frowns and then marches off. Walker and Bolter stand together uneasily, and nudge each other)

WALKER: } (*speaking* } Good morning, nice morning, sir.  
BOLTER: } (*together*) } Morning, morning, expecting you sir.

BATES (*still examining arch and after a pause*): I hope you don't find your duties too great a strain on your attention.

WALKER: } (*as before*) } Oh no, sir, we don't.  
BOLTER: } } We're used to it, sir.  
} } Oh no, no, we manage to keep up all right,

(Brushes away some crumbs.)

BATES (*turning*): Well, perhaps you will be good enough to see that the bricklayers flush up after—

BOLTER (*breaking in*): That what I'm always telling 'em, sir.

WALKER (*loudly*): Now I never heard the like o' that—all the years I've been a builder, there never was a word about flushing up; if my father—

BATES (*beside himself with accumulated annoyance*): You'll take my instructions, please.

WALKER: Sir, I have only to say—

BUMP (*rushing up and in a loud high-pitched tone of complaint*): Now look here, they haven't put them china plates up over the front entrance.

BATES (*breaking out*): Oh damn your china plates. (*Strides off.*)

A Fountain at Catford, erected by the inhabitants of Southend village, Catford, in commemoration of the sixtieth year of Her

## COLOUR DECORATION.

BY COLE A. ADAMS.

AT the meeting of the Architectural Association last Friday, Mr. G. H. Fellowes Prynne presided. Mr. Cole A. Adams read a paper on "Colour Decoration," of which the following is the substance:—

My discourse to-night is addressed to students, and I shall attempt no dissertation upon the higher flights that have to be ascended in treating so voluminous a subject as Colour Decoration. I propose to speak of some of the various methods adopted in colour decoration and to offer a few suggestions which may be of use in your study of

THE GROOTE KERKE, DORDRECHT. DRAWN BY H. F. WARING.

Majesty's reign, has just been opened. The fountain, situate at the junction of Bromley Road and Beckenham Lane, Southend, has cost £120. It is also proposed to erect a water trough for horses.

the subject. In our cities and manufacturing towns the architect, in attempting to add the charm of colour to his building, has to encounter the smoke demon, who, no sooner than the building is finished, sets to work to

deface it as far as he is able. At present—and I fear so long as he is permitted to work his wicked will—no remedy is possible. Perhaps in the future, when we shall see more use made of electricity, or some means are found to compel manufacturers effectually to consume their own smoke, and householders also, then, when this demon is chained, we may see our buildings decorated with a colour of a more cheerful tone than they now possess.

#### Majolica and Mosaic.

The trials which have been made of glazed earthenware or majolica for both outside and inside architectural treatment are hardly, I think, quite satisfactory. It is an excellent material where cleanliness is a sanitary necessity, but the glazed surface is fatal to that repose that colour when applied to a building seems to demand. It gives a restless appearance which is disturbing to the harmony of colour; and even this material our enemy, the smoke fiend, does not respect. The light falling on the mouldings and ornaments is a disturbing element, and distorts them. It gives a better appearance, and is more decorative if the material presents a smooth, non-reflecting surface, and has only a dull glaze. You do not varnish decoration which you apply in oil colour, for the reason that you would lose that quality of flatness and repose which is so important. Detached objects executed in a glazed earthenware are properly so treated; it is when it is applied to large surfaces it becomes distracting. These remarks apply, but in a lesser degree, to polished marble, which, unless introduced with great discrimination, is hardly satisfactory when covering large surfaces. Mosaic should, I think, be always employed on a concave or convex surface; it is hardly ever pleasing on a flat surface, hence its unsuitability in reredoses, as generally applied.

#### Church Decoration.

And here I am tempted to ask how long the custodians of our cathedrals and churches and the worshippers in them, will be content with the sculpture and painting that is generally thought good enough? There are not wanting instances where one sees work which it is a pleasure to find, but such instances are rare. Buildings erected by our best architects contain too often sculpture and painting executed by incompetent and nameless artists. Sedding saw this need for calling on accomplished artists to help him in his work, and all true architects would wish it, instead of having to be content with the poor, lifeless, mechanical productions of advertising firms one generally sees. When we go abroad we are shown some masterpiece of the sculptor's or painter's Art done at a time when the highest efforts were alone thought worthy of a place in the sanctuary; and yet at the present time men are richer than they ever were, and could the better afford to give. The monuments to the dead in our cathedrals and churches are frequently works of worth and beauty, but we want equally good work dedicated to the service of the living God we worship. Mention must in fairness be made of the great progress made in stained glass; much of it is admirable. Perhaps it will not be long before the educated and wealthy will call in the aid of artists who will give us works that shall be worthy of the buildings they are placed in, and worthy of the artists who executed them. There can be no better medium of perpetuating their fame.

#### A New Decorative Process.

In a house in the north, where it has been my privilege to stay many times, built for the most part by a man who comes from an artistic race, and who himself is artistic in every sense, is a mode of decoration which, as far as I know, is original, and certainly it is most delightful. The walls and ceilings were prepared in the usual way. They were then covered with a thick coat of oil and whitelead, made the consistency of pudding, and laid upon the walls and ceilings with a trowel. The next process depended upon what the nature of the design was to be. Supposing it was the ceiling to be treated, as a vine trailing over the whole sur-

face; the artist with his thumb boldly draws the leading lines of the design, and then with the end of an ordinary paint brush draws the stalk, leaves, and fruit. Those parts which he wishes to emphasise he models in the material—such as the grapes, which are raised in relief; in fact, with the coating which he has been careful not to lay on to a uniform thickness, he is able to produce effects, whilst moist, as his fancy dictates. If he wants a more or less geometrical pattern on the walls he takes a comb, and by eye draws in patterns such as you may see done on the outside plaster of old cottages in Suffolk and elsewhere, and also similar to some Japanese patterns with which you are all familiar. Again, on the surface thus prepared, he puts a powdering here and there of small patterns. This coat, which is capable of taking any kind of design the artist may wish and his fancy dictate, is allowed to dry and harden. It is then painted the general colour it is to be, and the artist has various mixings at hand of the same colour, and blends them as he goes. Those parts of the design to be gilded are so done and the various colours applied and allowed to dry. Finally the work is dull-varnished and has bronze powder mixed with the varnish, which gives a kind of sheen to the whole. The bright parts in gold are toned down, and the colours blended one with the other. This, as far as I could gather, is the process. It is unlike anything with which I am acquainted, and it has great possibilities. It gives somewhat the charm that a picture does in which the colour is laid on unsparsingly with brush and palette knife. The burred edges of the patterns, flowers, or fruit raised in the process reflect light. The colours running one into the other satisfy the eye by their variety, and the dull old gold effects, mingling again with the bronzes, give a richness and *tout ensemble* which is charming. This work, however, must be done by artists. Executed by the ordinary decorators it would be intolerable. One striking effect in this house was suggested by the patron; he saw a ceiling after it had been floated with the oil and white lead with the trowel marks left. With a happy inspiration, he told the man to leave it so, and paint it with a deep copper bronze. The result is a most happy one—it has the same charm that beaten copper produces.

#### The Architect as Decorator.

There may be some among you with an eye and love for colour and ornament who might do much worse than take up this branch of Architecture as your calling. With the advantages you enjoy of learning your profession, it would be a great gain to you, and you would bring to bear a knowledge of Architecture and building construction which would be of infinite use. The want of such acquaintance with this Art accounts for the failure one so often sees in modern decoration. If we possessed artists with architectural knowledge, who made it their calling to decorate buildings, it would be a great public good, and the public need educating in the matter of good taste. Growing up around us are town halls, picture galleries, free libraries, swimming baths, &c. Do not these offer scope for the artist? There are hundreds of such buildings lately come into existence waiting the hand of the artist. For a moderate sum, depending largely, of course, upon the building and the class of decoration, they might be made more attractive and interesting. Now, what happens? The powers that be call in the local painter and decorator; he sets to work and—paints it. Knowing very little of the principles of decoration, absolutely nothing about Architecture, he, of course, cannot apply his decoration architecturally, and as a result, he not only wrongs the building and the architect who designed it, but commits the further crime of offending against good taste. Now, for comparatively a few guineas paid to an architect, who made such work his speciality, or to a skilled decorative artist, the same local painter and decorator might be led to turn out a work which would at once appeal to educated taste and give the public decoration

GABLE AT LEIDEN. DRAWN BY H. F. WARING.

of which they might be proud. I believe if authorities having the care of such buildings knew where they could obtain competent advice and skill in carrying out this class of work, they would avail themselves of it. There is abroad everywhere a quickening of interest in public life, and the cities and towns are vying with one another in providing buildings dedicated to the use of the public, which augurs well; and, as time goes on, we may look for a further extension of this good—as good it is—tending to break down class prejudices, and bring peer and peasant together with the happiest results; in good time much may be done to render the lives and homes of the poor happier and better by this process of levelling up. To this end the decorative artist may employ his talent and do good by creating beautiful work that must have a refining influence for good. Few towns there are of any importance that do not tempt our great singers and actors to visit them, few that do not possess some work of an architect of eminence, and it may be that at no distant future, few will be said not to possess some work of Art of a great painter or sculptor in a richly decorated building. Is it not worth working for to become one of them who shall add to the fame of the town who employs him, by his skill in colour decoration, instead of leaving such work to be ignorantly and vulgarly carried out?

#### How to Gain Experience.

Experience in practical decoration may be gained in a way that is probably within the reach of most of you. In the parish in which you reside there will be a school or a parish room, and the parson would doubtless be glad of anyone who could be found to volunteer to decorate it. This would give you the opportunity of doing experimental work which would be excellent training, and, at the same time, you would be doing practical good to others. But how to set about it! The Parson may not unreasonably object to having his building made use of for experiments. You must first qualify yourselves by learning the handicraft to convince him you know something about the Art. I think one of the best ways to study decoration is to sit down before the object you are engaged upon

and try and grasp the notion or leading idea of the artist; how he has treated it and how worked it out; what leading colour or colours he has chosen; in short, its leading characteristics. Having taken in the scheme or design, I think the next best thing is—supposing it to be a ceiling, for instance—to make a plan and sections of it, then select that portion which will illustrate how the design or pattern will repeat. These drawings you should sketch as neatly and with as little detail as will express the thing you are at work upon, then put on a few leading dimensions; note the distance from the eye where the decoration is most effective, the distance from the eye, the style, probable or approximate date, place, and, in fact, each and everything that occurs to you as worth noting. Having made these drawings, which may be more or less elaborated according to what you are engaged upon, you may now proceed to detail the work to a larger scale, and draw with the greatest care the ornament. A number or letter referring to where the part is should be noted on the plan or section, so that the details may agree with the drawings. When you have got your details sufficiently forward in pencil you may then proceed to colour them, and this will test your eye for colour. If you have not got your colours with you, or are pressed for time, a simple plan is to put on the drawing a schedule of colours, and number them thus—red 1, blue 2, yellow 3, and so on; or you may elect to adopt the heraldic method. Either of these ways will be of use in keeping you in mind of the scheme of colour, and then you can, at your leisure, colour in your drawing; but the study will be of most use which is painted on the spot. It all depends upon what you are sketching, but where the detail would work out very small and not large enough to explain the design, that part should be drawn to a larger scale. As you proceed you will insensibly learn what best shows and illustrates the subject upon which you are engaged.

After some remarks on the importance of studying nature and acquiring habits of close observation, Mr. Adams went on to speak of

#### Perspective Drawing.

You will find it useful, he said, to acquire the art of sketching in perspective. You can in less space show so much more of your subject, and if you can readily and easily sketch in perspective, it conveys the intention much better to the lay mind. It has, besides, a commercial value, as you may convince a client the more readily if you can show him how a work will look when executed. At the same time, do not let this kind of sketching take too great a hold upon you to the neglect of careful and figured details drawn either by eye or to scale. Drawing in perspective becomes so fascinating that the temptation is to make a picture, and you will learn your lesson better by a hard matter of fact diagram. In making studies of ornament in monochrome, it is most useful training to do so with a brush. You cannot get anything like the freedom or effect by using pencil or pen, and you will come nearer to the Greek and the Japanese if you copy their painting direct with a brush. With a little practice you will find no great difficulty; besides, it is excellent training, and it will let you into the secret of how they produced their effects and why their ornament takes certain forms.

#### Greek Ornament.

If you wish to study the ornament as practised by the ancient Greeks, go to the British Museum, make your way to the vase-rooms, and you will see how, by the employment of simple yet lovely forms, they have produced designs in endless variety and mostly with the use of a single pigment. We frequently hear a great deal about the accuracy displayed by the Greeks in their treatment of ornament. Many of the examples which have come down to us are anything but well drawn, and all that I have studied show an absence of mechanical accuracy, being obviously executed by the eye and hand only. It is the fashion in employing Greek ornament in decoration of all kinds to do so with geometrical precision, with the

result that it is all "Faultily faultless, icily regular, splendidly null." It does not pulsate with life, and to employ Greek ornament thus is to miss half its beauty, which does not consist in perfect accuracy of parts, but in that charm which the trained eye and hand alone can give to all work, and which is lost in mechanical execution.

In the repetition of ornament, where the same pattern is employed over and over again, stencil plates are generally used. The whole art of stencil-plate cutting has a rather narrow margin of limitation, and work carried out with the extensive use of stencilling is

secured together at all available points, place on a sheet of plate-glass, cut out the parts through the several sheets with a sharp knife. Then, when you have cut out the pattern, liberate the sheets and insert between two of them a network of very fine wire, which may be made taut by attaching it to a frame (a trifle larger than the paper stencil plate) of stout wire. The two plates, being exactly adjusted, should then be pasted together, and when dry give another coat of knotting. It may be objected that the wire which takes the place of the "ties" will be objectionable and will show in the colour, but with skill in manipula-

A STREET IN DORDRECHT. DRAWN BY H. F. WARING. (See page 35.)

anything but pleasing. It has a thin, starved, stiff, mechanical appearance. The Japanese employ stencil-plates for the decoration of their textile fabrics, and produce most artistic effects; whether they have any like method in use for wall or ceiling decoration I do not know, but I venture to throw out a suggestion for adapting the principle employed by them, and applying it in a modified sense to our use. Let the design to be employed in repetition be drawn on fairly stout cartridge paper, and it may be designed without any care for the "ties" which it should be the object to dispense with so that the plate shall leave the stencil brush finished. Then give the paper a coating each side of patent knotting, and with three or more similarly prepared blank sheets

tion it may be made, if you will, to become part of the design. I do not think it will be any detriment, and at all events the plan will admit of a much wider, more artistic, and more extensive use of stencilling. By having on your palette several mixings of the colour of varying tints, and two or more stencil brushes in use, it is very easy to blend the colours of the stencilling in executing it, and to remove the harsh mechanical appearance one so often sees. By a series of plates effects can be produced, on the same principle as wall-papers or printing in colours is done, and much of the objection to stencilling will vanish by adopting this method of the Japanese. The difficulties that beset a decorative artist are very great, and he must be ever studying

so as to store his brain and keep abreast of the times. I think a student can hardly do better than commence his studies of decoration of the different styles with copying from the decoration of savage tribes, of which the British Museum and most museums contain a goodly collection. I advise this as affording illustrations of what the untutored man does in ornament and colour, and there is a marked likeness in the early efforts of different nations or tribes; lines, circles, dots, zig-zags, herring-bone, and the employment of the primaries of colour. Then the styles should be taken, commencing with the Egyptian as the earliest. Let me suggest a visit to the Crystal Palace at Sydenham, where an object lesson may be learnt from the courts decorated in the different styles. Unfortunately in this country we have but few examples of ancient decorated buildings to study from, and have to be content with the fragments in our museums and the various objects to be found there. Still, one must take things as they are and be content; but however beautiful the various fragments are, they have not the teaching that applied decoration to a building possesses; to obtain this you will have to go abroad and study the style you wish to become acquainted with in its own home, with all the surroundings which so influence the art. Much and most useful information is to be gathered from the splendid works which have been published, and which you may see at the museums and in the library of the Institute and Architectural Association. They are magnificently illustrated, but the colours can only faintly show the effect that the building produces under the ever-varying light and shade. As it is hardly possible to study all the styles in the land where they have had their birth, you must study from those specimens which we possess and from books.

(To be continued.)

## A FORGOTTEN QUARTER OF PARIS.

BY JOHN C. PAGET.

THE old Feudal Architecture of France was merged in the Renaissance by the work of the times of Francis I.; both systems had for their most familiar feature prominent—or in the case of towers conical—roofs. The chateaux of his reign are proverbial for beauty, and are seen at their grandest in Fontainebleau and on the banks of the Loire. But the reign of Henry IV.—coincident with the later Elizabethan and early Jacobean work in England—witnessed the triumph of Italian ideas of building; order and symmetry were more considered than picturesqueness; the sparkling style of Lescot and De l'Orme disappeared: one feature alone remained from the past, it was and is ineradicable from French building art—the high-pitched roof.

If not so beautiful as their predecessors, there is much that is dignified in the buildings of "Henri Quatre's" period. Three materials were used; the body of the house in red brick, usually white-pointed, is broken by high pilasters in stone; the windows are lofty casements, topped by small pediments; the roofs are of slate, sometimes dark, sometimes of greenish hue, high pitched with only a few bold dormers; lead is used for ornaments, whilst masks and caryatides break up monotony; the doorways are often covered with a large hooded pediment; under it the tympanum is richly carved with heraldic shields, trophies, and sculptured figures.

Some of the best of these designs may be studied in a quarter of Paris long since deserted by fashion, the Marais. Its centre is the Place des Vosges. Deserted in the eighteenth century for the Faubourg St. Germain, as that in its turn was for the new quarter built by Baron Haussmann, it was nevertheless for many years the Court suburb of the capital; Henry IV. suggested its formation; his great minister Sully supervised the

scheme, and the Huguenot architect Du Cerceau was responsible for the design. In this fine old square we see one of the first attempts at laying out a city with open spaces on a symmetrical plan; a precedent never afterwards lost sight of in Paris.

The square occupies the site of the historic Palais des Tournelles, so called from its innumerable turrets and bartisans; the houses are separate residences, and are slightly varied, but bear the impress of one design; they are in three stories, the lowest being open to the street and arcaded, forming a promenade constantly alluded to by old dramatists as the scene of their comedies. The high roofs are simple, but not yet of the form to which Mansart gave his name; here and there they rise into a pavilion, and under one of these on the north side the King had intended to live himself when his career was cut short by the dagger of Ravallac. No. 21 was afterwards occupied by Richelieu.

The neighbourhood a few years ago abounded in town houses of old French families, for the most part deserted by their owners, the basements turned into shops, the upper floors let as *appartements*, the French equivalent for "flats;" each was known as the "hotel" (the word is used for palace or private residence) of a particular family. Every year that passes sees some local change, some feature removed, some mansion pulled down, but a certain number remain, and though no longer maintained in splendour, are extremely characteristic specimens of seventeenth century Architecture.

At 143 in the Rue St. Antoine is the Hotel de Sully, built for Maximilian de Béthune, Duc de Sully, by Du Cerceau. The front is richly decorated with pilasters, hooded pediments, and masks; within is a courtyard—the system of building thus has never died out in France. Each side of the court is sculptured with figures representing one of the Seasons, with armour, foliage, and masks; the French are singularly conservative in their arts, and masks are features rarely absent from a design. Wherever ironwork is introduced in windows or balconies it is strong, graceful, and flowing, and it may be noted that the details in iron seen in the new boulevards are often exact reproductions of the designs of the seventeenth century.

The roof is broken by large dormers, with curved pediments; the interior still retains a fine staircase and a "great room" or "salon" on the first floor; in the last century the mansion was occupied by another minister, Turgot, shortly before the Revolution.

At the corner of the Rue des Francs-Bourgeois stands the Hotel Carnavalet. Originally designed by Lescot and Bullant, it was modified by an architect whose name is a household word in France, the elder Mansart; here we may trace the beginnings of that system, which his nephew completed, of raising roofs into high conspicuous masses but truncated; his name slightly altered into *mansarde* is a synonym for a garret or any room under the roof. A family likeness may be said to run through these designs; the pedimented windows, the pilasters, the carved masks, the wreaths, arms, and shields appear in all, though differently combined, and the three materials are the same; red brick, stone of the light creamy grey, which in those days was quarried from Montmartre; and slate. The house will always be famous as the abode, from 1677 to 1698, of Madame de Sevigné; it was here that she wrote many of her celebrated letters.

The Hotel de Beauvais is notable for its front decorated with heads of lions and rams, the latter a punning allusion to Catherine Bellier, wife of Pierre de Beauvais, the builder. The courtyard is elliptical instead of rectangular, and shows originality of design; the growing neo-classicism of taste is evidenced in the vestibule, whose Doric columns sustain trophies; the staircase, flanked by Corinthian columns, is adorned with bas reliefs, and has an elaborate balustrade. From a window on the first floor, or *belle étage*, Anne of Austria witnessed the return of her son, Louis XIV., with his Spanish bride the Infanta Maria Theresa.

The Hotel de la Force has been pulled down.

It had terrible memories. Built for the Duc de la Force, it had several courts, and was so large that it was ultimately bought by the Government for a prison, and during the Revolution it was there that some of the worst of the "massacres of September" 1792 took place.

The Hotel de Lamoignon survives, and is remarkable for its complete system of very large double Corinthian pilasters admirably applied, especially at the angles, both salient and re-entering; though faded it is still grand.

Behind the eastern side of the Palace des Vosges runs the Rue des Tournelles; in it the house of Ninon de l'Enclos may still be seen with its quasi-classic vestibule decorated with masks and caryatides, boudoir with painted ceiling, and great balustraded staircase.

No city has been more completely transformed in our time than the French capital, but the building art of France, taken as a whole, has changed less than that of any other country. It remains to be seen whether its leading characteristics will survive the creation of structures of enormous height destined soon to become general in modern cities.

## THE NEW RAILWAY TO LONDON.

MR. RITCHIE, President of the Board of Trade, has consented to open the Great Central Railway Company's new line to London. The date has not yet been absolutely fixed, but it will be early in March, probably during the first week. Special trains, containing invited guests, will be run from the principal towns of the Great Central Railway Company's service, including Manchester, Sheffield, and Lincoln, and luncheon will be served in London, at which Mr. Ritchie will be present. Here the formal ceremony will take place. The new line is of great commercial importance. It will open out new districts in the centre of England, and is destined to play an important part in fostering the mining industry of those regions. It will not provide a shorter route to London from Manchester than those already in existence, but it is the intention of the company to organise a service which shall cover the distance in the regulation time of four hours and a quarter. The ruling gradient is the small one of one in 176, and the curves are on the 60 chains radius. The line, therefore, is admirably adapted for the fastest speeds. The rails throughout are weighted at 86lb. a yard, and are "keyed" on the outside, in accordance with the most modern engineering devices. All the stations, except two, are on the island plan, an arrangement which will allow the lines to be doubled, when the traffic demands the extension, without the removal of a solitary brick of existing stations. The bridges, too, are constructed to allow of the doubling of the lines. The London terminus is in Marylebone Road. On the day the line is opened there will only be two lines available for use. The remainder of the five lines running into the station will be covered temporarily with a substantially-built platform, and partially enclosed in order to make, for the time being, a large hall, where the opening ceremony, to be presided over by Mr. Ritchie, will take place. Nearly all the internal fittings of the station will be in their place in a few days, and booking offices, waiting-rooms, bookstall, and all the *etceteras* appertaining to a modern railway station will be completed ready for occupation by the staff of officials. The offices for the goods staff are in a very incomplete condition. The roof is not yet on the large building which is being erected to accommodate them. The immense warehouse at the main line end of the goods yard is, however, being rapidly brought to completion. A few weeks ago only half the building had been erected, but during the last month the ironwork required has been delivered at a very rapid rate, and consequently the work has gone on with extraordinary speed, so that in a short time the roof will be on, and the work of putting in the flooring can be commenced.

# R. I. B. A.

## PUBLIC LIBRARIES.

AT the meeting of the Royal Institute of British Architects last Monday, Professor Aitchison, R.A., presided. The subject for discussion was "Public Libraries," and two papers were read, one from the architect's point of view, by Mr. J. M. Brydon, F.R.I.B.A., the other from the librarian's point of view, by Mr. F. J. Burgoyne. Mr. Brydon explained that his object was to show, with as full illustrations as possible, something of what had been recently done in library building, so that one may learn what to follow in the future. A suitable site is of primary importance. It should be central and prominent, yet quiet; ample in area to allow for future extension; have a good light all round, and be dry. As regards the building, the free and open system of the ordinary popular library—i.e., reference and loan, combined with reading rooms—rendered proper supervision essential, and as libraries are usually understaffed, the arrangements of the plan must be concentrated, so as to enable the officials to supervise at a glance all the rooms to which the public have access.

### An Ideal Plan

is to place all the public rooms on one floor. Where this cannot be done, the rooms to which most frequent and rapid access is required should be placed on the ground floor, and those less frequented on an upper floor. The administrative portion of the library, such as the book stores, the librarian's office, and the workrooms for the staff, must be conveniently placed for the service of the department to which they are more particularly attached. The public rooms should be lofty, well-lighted, and thoroughly ventilated. The planning of a public library is not, however, a complicated problem. The requirements are comparatively few and simple, and lend themselves to a stately and architectural system of design from which some striking effects almost necessarily follow. It must be endowed with a fitting dignity both in plan and elevation. The reading rooms, being large, give ample scope for the designer's knowledge of proportion. They should possess that quiet dignity of effect which can only be obtained by good proportion and restraint in design. Respecting

### The Lending Department

the author considered that an architectural opportunity had been missed in many recent English libraries. Instead of being simply a book store, with a space cut off for the public, the delivery room might be treated as a hall by itself, as in some of the American libraries notably at Boston. There the delivery room is 64ft. long by 33ft. wide, and 20ft. high, and is decorated in the most sumptuous manner. Adjoining it is the stack room, to all parts of which application slips are sent through pneumatic tubes. The books come back to the alcove by means of a little electric railway with wire basket carriages. The delivery room at the

### Edinburgh Public Library

is modelled on the telling-room of a Scotch bank. The central space is devoted to the public, with counters round three sides, and alcoves behind them for the storage of books. This arrangement gives scope for, and is treated with, considerable architectural effect, a handsome hall being the result. The public library of the future will be the centre of culture and enlightenment of the district in which it is placed, and will wield an influence which must ever become wider and stronger. The building should be of such a character as to assist this influence. The suburban villa type with its useless turrets and bay windows should be altogether discarded—in short, the building should be endowed with that distinction of style and nobility of design which will render it an enjoyment and inspiration to all who hope for the growth of a living interest in Architecture as a fine art. Having briefly referred to the arrangement of rooms in

libraries recently erected in the United Kingdom, plans of all of which were shown, the author turned to the great American libraries, describing in more or less detail the buildings, plan, and notable features of the Congressional Library at Washington, of which an interesting historical sketch was given, the Public Library at Boston, the Columbia University Library, New York, and the Public Library about to be erected in New York. In the

### Washington Library

the American Government had commissioned American sculptors and painters—some fifty in all—to decorate broadly and thoroughly one of its great national monuments. Staircase, hall, and rotunda, or reading-room, are a blaze of rich marbles and decoration. In the rotunda, the columns and pilasters of the piers carrying the dome are of red Numidian marble resting on pedestals of dark purple Tennessee marble, their capitals being gilded. The screens between the piers are of yellow marble, and the portrait statues which surmount the balustrade are of bronze. The building is 468ft. long from north to south, 340ft. deep from east to west, by 72ft. high. The rotunda is 100ft. diameter, 12 ft. high to the top of the dome, and 160ft. to the domed ceiling of the lantern. The architects were first, Mr. Smithmeyer, then General Casey, Mr. Bernard Green, and Mr. Pelz. The building cost £1,272,000 sterling. The great architectural features of the

### Boston Library

are the staircase hall and the Bates Hall—the former notable for its mural paintings by M. Puvis de Chavannes. The Bates Hall is the reference reading-room, it is 218ft. by 42ft., and 50ft. high to the crown of its arched ceiling. It has accommodation for 264 readers at 33 tables. Sargent Hall, named after the eminent painter, is 84ft. long, 23ft. wide, and 26ft. high. The ceiling is vaulted, and the hall is lighted from the roof. The decorative painting will be entirely by Mr. Sargent, the scheme, representing the Triumph of Religion, illustrates certain stages of Jewish and Christian history. The interior court is surrounded on three sides by an open arcade of white marble, similar in design to that of the Cancelleria Palace in Rome. In its centre is a marble fountain, set about with grass plots; along the walls under the arcade are low oak benches, so that on warm days the court may be used as an open-air reading-room. The building is a careful study of modern Renaissance, thoughtfully and lovingly carried out, reflecting the greatest credit on its architect, Mr. McKim, and the public spirit that called it into being. Many interesting facts and figures in connection with this library and the branch libraries at Boston were given by the author. The third library called attention to, that of the

### Columbia University,

New York, was built and presented to the University by Mr. Seth Low, President of the University, as a memorial to his father. Construction and equipment have cost nearly £240,000. In plan it is like a Greek cross, with the great reading-room at the intersection of the arms, and covered by a dome. It has a magnificent approach of great terraces, and steps leading up to a noble entrance portico of ten Greek Ionic columns. The entrance hall is adorned with splendid marble columns. The building, of which many interesting details were given, may be taken as an example of a typical university library worked out on modern lines to suit modern requirements—a utilitarian scheme artistically carried out.

### New York's New Library.

The public library about to be built in New York was the subject of a limited competition last year, and copies of the successful design, lent by the architects, Messrs. Carrère and Hastings, were exhibited in the meeting-room. In its main lines it somewhat resembles the Boston Library, but in the instructions was this distinction, that though the authorities did not object to external splendour, they were rather disposed to favour a simple interior. The winning design had resulted in

a good plan, and what promised to be a stately dignified exterior. A marked feature is the raising of the building on a great terrace. The architects were not content with designing the building alone; it must have a dignified setting, so by means of broad flights of steps, terraces, fountains, and votive columns, the approaches were made to contribute to, and enhance the effect of, the architectural picture. This, the author thought, was a point to which more attention should be paid in public buildings in England. In conclusion the author expressed the hope, that these American works were not without their lessons for us in more senses than one—not only as libraries, but as public buildings.

### The Librarian's Point of View.

Mr. F. J. Burgoyne opened his paper with some observations on the limited income derivable by municipal libraries from the rates, urging that the initial charges for buildings and sites should be paid out of the general rates, and the whole proceeds of the penny rate be available for the current work of the library. The plan of the building should be considered, not only in relation to the public, but also to the probable size of the staff to be engaged. Dividing municipal libraries into three kinds, small, medium, and large, the author indicated the minimum accommodation that should be provided for staff, books, and public, illustrating his points by reference to plans of existing buildings, a large number of which were shown by the lantern.

### Requirements of Large Libraries.

In the larger libraries the work done in the reference department is of the most valuable character, and it is advisable to have, in addition to the ordinary reference reading-room, a smaller room for the use of students of special subjects, or those who are engaged upon original research. The librarian should have a room for his own use—one that may be used if necessary for the meetings of his committee. In large libraries there should be a fire-proof strong-room on the same floor as the reference department, in which the rarer books and MSS. can be stored, and rooms for repairing and binding books. There should be mess-rooms for the staff and suitable lavatory arrangements. The author recommended that before planning a building a clear idea of the method of work to be employed should be obtained from the librarian.

### Systems of Shelving.

In shelving the books in the lending department it is important to place them as near the issue desk as possible in order to facilitate quickness of issue. Reference books, the author considered, were best shelved in a storeroom adjacent to the reference reading-room. Room must be allowed for growth in this department. It was estimated that in the larger libraries stock would increase threefold in twenty-one years. To cope with such an accretion, the author favoured the adoption of the American "stack system" of packing the books, combined with rolling bookcases, for works in least demand. This system was described by the author, and plans and sections were shown of the stack systems in the libraries at Grieswald, Halle, and Strasburg. The new system of sliding presses in use at the

### British Museum Library

consists of stacks three tiers in height and about 9ft. apart. In front of each bookcase a couple of steel girders with flanges are bolted to the iron floor above, at a distance of about 36in. from each other, and at right angles to the case. From these girders hangs a bookcase of the same width, to within a few inches of the floor. It can be filled with books, and is readily pulled away from its normal position close against the front of the fixed bookcase. It can be adopted piecemeal as the necessity arises for greater accommodation in any particular section of the library. In the discussion which followed the reading of the papers, Mr. F. Pacy, hon. secretary of the Library Association, Mr. J. H. Quinn, librarian of the Public Library, Chelsea, Mr. H. H. Statham, and Mr. H. Beresford Pite took part

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### BAKERIES.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In reply to the question by F.W.A., on page 26 of last week's issue: a paper was read at a sessional meeting of the Sanitary Institute on the 14th February, 1894, on the subject of Bakehouses, by Dr. F. J. Waldo, Medical Officer to the Vestry of St. George the Martyr, Southwark. (See Journal of San. Inst., Vol. 15, pp 21—36.) Y.  
London, N.W.

### RIGHTS OF LIGHT.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I have purchased a plot of land, adjoining some property, which was erected sixteen years ago; I purpose building premises on this land which will damage the lights of the above mentioned property. I should be much obliged if you could inform me through your valuable paper, whether (legally) I should be doing wrong.—Faithfully yours.  
H. F.  
Lancashire.

As the building adjoining the land on which you propose to build has not been erected for a period of twenty years, no claims in respect of "Ancient lights" would be valid. There is, therefore, no legal objection to the course you propose.

### CARPENTRY AND JOINERY.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you inform me whether there is a book published on "Practical Carpentry and Joinery," by George Ellis, as contained in the BUILDERS' JOURNAL, and if so, the price and where it can be obtained.—Yours truly,  
W. S.  
Luton.

These articles have not yet been republished in book form, but we understand Mr. Ellis contemplates arranging for their republication. Meanwhile the numbers of the BUILDERS' JOURNAL containing the articles can still be obtained from the publishers; the numbers in Vol. VI. cost 2d. each, those in Vol. VII. 1½d. each, and those in Vol. VIII. 1d. each. The prices of the bound volumes in which the articles appear are: Vol. VI. 7s., Vol. VII. 6s., and Vol. VIII. 5s.

### A RARE BOOK ON ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you be kind enough to give me your opinion, through the columns of your valuable paper, as to the value of a book which has come into my possession which more particularly describes and illustrates in a splendid manner the five orders of Architecture? The book is printed in the old style of printing on the old-fashioned white rough paper, each page being sunk panelled, and is bound in plain, dark leather with single gold line at edge, date 1740, by Batty Langley. I have an idea it is of value, and should like to know for certain.—Yours faithfully,  
Sittingbourne. E. C. P.

You may congratulate yourself on having a copy of the first edition of one of Batty Langley's best known books. The book was afterwards enlarged by fourteen plates, and editions were issued also in 1741, 1750, and 1756. It is impossible to tell you the value of the book without knowing its condition; moreover, the value of these rarer books depends on what buyers there are at any particular time. We have not seen a quota-

tion lately. The book, however, is of value. Mr. Batsford, High Holborn, London, is a well-known dealer in works relating to Architecture.

### ARCHITECT AND QUANTITY SURVEYOR.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you kindly tell me whether the undermentioned has ever been decided, viz.: The right of architect to pledge credit of client for quantity surveyor's fees? Any information will greatly oblige.—Yours truly,  
H. Q.  
Oxford.

It has been decided that where the client authorised the architect to obtain tenders, he thereby gave the architect authority to engage a quantity surveyor (see *Waghorn v. The Wimbledon Local Board*, reported in the "Times" newspaper of June 4th, 1877, and copies in Hudson's Building Contracts, vol. 2, page 86). See also *Taylor v. Hall, J.R. 4 C.L.*, 469, per Monahan, C.J., page 479, who says: "No doubt a usage exists here and in England to the effect, that if an architect is employed to prepare plans of a contemplated building, and obtains proposals for the execution of the work, he employs a surveyor, such as the plaintiff Taylor, to make out quantities, so as to enable the builder to calculate for what sum he can execute the work, and a copy of the calculations so made by the surveyor is supplied to each builder who intends to send in a tender for the execution of the works; and no doubt an express or implied contract is made by each builder who so obtains the surveyor's calculations that, if he is the successful candidate whose proposal is accepted, he is the person who is to pay the surveyor his fees."

If no tender is accepted, or if, for any reason, the owner changes his mind, and no contract is entered into with the builder, the owner is, of course, liable to the surveyor, he being the person for whom the work is done, and the architect having the express or implied authority of the owner to employ the surveyor." This usage has been recognised in *England in Young v. Smith, Hudson*, vol. 2, p. 100, and in *North v. Bassett* (1892), 1, Q.B. 333.

## Correspondence.

### FACTORY DESIGN.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I agree with the remarks of Mr. J. H. Pearson, reported in your last issue, that in the erection of factories, mills, &c., which are to contain engines, boilers, and machinery to secure their successful equipment it is very necessary that the architect and engineer should work in combination, as the knowledge peculiar to both professions is here particularly required.

I cannot illustrate my meaning better than by relating a case which caused some litigation, and in which the writer was called in as an arbitrator. In this case the architect carried out the work entirely; and as regards the buildings—with the exception of the area and height of the boiler chimney-shaft—it was very satisfactory. The engine, shafting, and some of the machinery was, however, badly arranged, bearing in mind the work it had to do. The shafting to transmit the power was attached to the walls of the building instead of being placed under ground; and one of the machines with a reciprocating motion and running at a high speed was provided with an entirely inadequate foundation which had to be re-made before it would run satisfactorily. Speaking as an engineer I take it that in cases of this kind it is without doubt very unwise for an architect to assume the rôle of an engineer or *vice versa*, but surely a friendly arrangement could be made whereby the special knowledge of both could be utilized, which would be to the distinct advantage of the employer.—Yours faithfully,  
M. POWIS BALE.

## BEVERLEY MINSTER.

IN connection with Mr. J. Hervey Rutherford's illustrations of Beverley Minster which appear in our inset supplement, a few notes on this ancient and beautiful church may be acceptable. The oldest part of the present structure, viz., the eastern arm and transepts, dates from the thirteenth century, the nave was added about a century later, and the magnificent west towers were built between the years 1380 and 1430. One of the most remarkable characteristics of Beverley Minster is the unity of the whole design; the builders of the later parts seem to have entered into the spirit of the original builders to such a degree that they have produced a harmonious whole which betrays scarcely any sign of the intervals that separated the three periods of building. The detail is extremely simple, having none of the luxurious elaboration to be seen in Lincoln Cathedral and elsewhere, yet the proportions are so exquisite that the want of elaborate ornamentation is not noticed.

The dimensions of the Minster are as follows: Length from east to west, 334ft.; breadth of nave, 64ft.; length of great transept, 169ft.; breadth of transept, 69ft.; height of nave, 66ft.; length of choir, 46ft.; breadth of choir, 26ft.; height of central tower, 107ft.; height of the two west towers, 200ft. One of the peculiarities of Beverley Minster is that it appears to be larger than some churches of larger area; the height especially appears to be very great, although in reality it is quite moderate.

The western towers were evidently part of the original plan. It is supposed that the cause of the stoppage of the work when they were but just commenced was the terrible Black Death which devastated the country in 1349, and the following years. The following details with regard to the west front are taken from an article by Mr. John Bilson, F.S.A.: "The completion of the west front seems to have occupied a considerable period of time, extending well into the fifteenth century. It is frequently spoken of as a copy of the west front of York. The general design may quite possibly have been suggested by York, but it is by no means a copy, and its lofty proportions are certainly more graceful than the widely proportioned front of York. We must remember, too, that when the west front of Beverley was commenced, York was still without its western towers, and it is not improbable that the towers of Beverley were completed before the north-west tower of York was built. Both at York and Beverley the towers have the single belfry window on each face. In the York towers the buttresses stop below the parapet cornice, which forms a strongly marked horizontal line. In the Beverley towers the pinnacles grow out of the buttresses, and preserve the vertical character which is so admirable a feature in the design of the west front, as in the church generally. The details of the front are perhaps a little "hard," but it is, nevertheless, one of the finest façades we possess of the Late Mediæval period. Professor Freeman was extremely severe on what he called its "sham" gable, and he could scarcely speak of Beverley without condemning "the fault which ruins this otherwise noble front." Such a criticism would have more force if the designer of the west front had been also the designer of the nave, and it is quite evident that a steep-pitched gable would have ruined the design of his front as it stands. Instead of carrying through the lines of the nave roof, he preferred to ignore them, and to build a storey between the towers with a low gable, panelling the face of this storey, and continuing the panelling across the towers, so as to give a broad horizontal band, subordinate to, but binding together, the strongly marked vertical lines of the tower buttresses. I venture to think that he chose wisely."

Our illustrations are taken from the collection of drawings by Mr. J. Hervey Rutherford, which was awarded by the Royal Institute of British Architects the Pugin Studentship for 1898. A further selection from these drawings will appear in future numbers.

# Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
February 22nd, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

**Bradford Fire Station Competition.** A good deal of dissatisfaction has been aroused amongst competitors in the Bradford Central Fire Brigade Competition at the extraordinary lines on which the competition seems to have been conducted. The designs were exhibited last Friday and Saturday at the Central Free Library and Art Gallery, Bradford, but the competitors might have remained in ignorance of the fact unless they chanced to see an advertisement in the local papers. The awards of the sub-committee are as follows: First (premium £100), Messrs. Mawson and Hudson, Bradford; second (premium £50), Mr. W. J. Morley, Bradford; third (premium £30), Mr. Owen Roberts, Liverpool. The winning competitors seem to have sent in three alternative designs, and to a representative of the BUILDERS' JOURNAL who inquired which was the selected design was vouchsafed the information that no one in particular was selected, the premium being awarded apparently to the whole collection! There are other strange features about this competition, and we shall revert to the subject next week. Meanwhile a protest is being formulated by several competitors against the decision arrived at by the Sub-committee, and if any other of the competing architects wish to add their names to the protest we shall be pleased to put them in communication with the leaders of the movement.

**Concert Halls.** The interest in the Soane Medallion award at the R.I.B.A. does not appear yet to have entirely evaporated. Our contemporary, "The Builder," published in its last week's issue the design to which, in its opinion, the prize ought to have been awarded. This is the design of Mr. W. Stanley Bates, and it is certainly clever and interesting, and has the advantage over the winning design that it conforms to the regulations of the London County Council. On the other hand, the elevation is far less pleasing than that of Mr. Mellon's concert hall illustrated in our issue of February 1st. By the way, Mr. Bates' attitude to our contemporary for its patronage and approval is likely to be tempered by the fact that it has printed one of his designs side down. This, we take it, is another sample of the humour which persists in announcing that the Ramsgate Corporation is voting designs for a concrete hall and reading room.

**The Housing Problem.** FROM time to time the question of the housing of the working classes in great cities brought prominently before the public, and various schemes—good and bad—have been tried to cope with the tremendous problem. At present the question may be said to

have reached, in London, at any rate, an acute stage. Rents are being raised, overcrowding is increasing, and working men are finding it increasingly difficult to find shelter, even at ruinous rentals, within easy reach of their work. The increase in the number of cheap trains and trams to the suburbs—a remedy often suggested, and to a certain extent adopted—is of little service to those whose employment is irregular, and who are consequently obliged to be on the spot to pick up work when it is to be had. What, then, is to be done? Both the House of Commons and the London County Council have been discussing the question; but, so far, the only matter on which general agreement has been arrived at seems to be that "something ought to be done."

**The Disease.** How pressing is the need for municipal or Government action in this matter has been brought home to many by an excellent series of articles that has been appearing in the "Daily News." It is stated that in London alone some 900,000 persons are living under conditions of overcrowding which the law declares to be insanitary, and therefore forbids, though, of course, it is impossible under present conditions to enforce the law. We read of a respectable workman coming up from the country to take a "job" spending the whole day seeking vainly for a roof to shelter him, and being driven in the end to take his wife and children to the workhouse. Mr. Crookes, at last week's meeting of the London County Council, told an equally lamentable story of misery caused through overcrowding. A man, wife, and five children were in the Poplar Workhouse. The man came out, obtained work, got his family out, and proceeded to look for a room in which they could find shelter. Although he searched the neighbourhood for days he could find nowhere to lay their heads until he lighted upon the cabin of an old disused barge in Limehouse Creek, and there for several weeks he and his family herded, a friendly waterman rowing the children every day to the shore so that they could attend school.

**Some Remedies.** THE London County Council's housing schemes are but a very partial remedy for the existing evils; indeed, from one point of view they may even be said to intensify the evil, for the Council does not provide accommodation for half the population it displaces, and consequently overcrowding in the surrounding districts is increased. Sir Arthur Arnold, at last week's meeting of the Council, went so far as to say that the present system of housing the poor was a sham, for not one of those evicted from foul slums was afterwards rehoused in the Council's dwellings. One thing which limits the work of the Council in this direction is its standing order to the effect that sufficient rents must be charged for rooms in the Council's dwellings to cover all outgoings, and leave no charge on the rates. This order Dr. Cooper proposed to amend by omitting the restriction. An amendment to refer the matter to the General Purposes Committee for consideration and report was carried. Another remedy was suggested by Mr. Glanville, viz., that land should be bought in the suburbs, and cottages erected thereon, each of which should accommodate two families; the rentals to be not less than 5s. nor more than 10s. a week. This proposal also was referred to a committee for consideration.

**Threatened Vandalism Averted.** BRISTOL antiquaries were much concerned the other day when they heard that the Building Committee of the Board of Guardians had recommended that "four ventilators should be fixed in the ceiling" of the historic "Court Room" at St. Peter's Hospital, where the weekly sittings are held. This room is the principal chamber of a many-gabled timbered mansion erected by Robert Aldworth, in 1612, upon the site of a much earlier house. The ceiling, which is a splendid example of early Jacobean work, is particularly handsome, and is composed of square, diamond, and quatrefoil compartments, con-

structed by floral and other ornamented divisions; it is surrounded by a deep frieze, composed of armorial shields and griffins. The proposal referred to was made on the 3rd inst., but public feeling was distinctly opposed to this "vandalism," as the room is one of the finest examples in the country. Several energetic members of the Clifton Antiquarian Club took the matter up, and the Society for the Protection of Ancient Buildings also protested against the proposed injury. "This famous and unique ancient room," wrote the secretary, "should not, it is thought, be sacrificed for purely utilitarian requirements; and it is believed that no method of piercing the ancient plaster ceiling for the purposes of ventilation could be satisfactorily effected without causing irreparable damage." When the Board met on the 10th inst. the Committee came prepared to ignore its former suggestion, and recommended instead the erection of a new Board room—the only real way out of the difficulty.

**Discoveries at Pompeii.** MR. CONSUL NEVILLE-ROLFE'S report on the trade of Naples and district for the year 1898 contains some facts about some recent archaeological discoveries. A very interesting mosaic (he says) was discovered a few hundred yards outside the wall of Pompeii last summer, and has been purchased by the Italian Government for the Naples Museum. It represents a conclave of seven philosophers amongst a group of ruins. The principal figure is seated and reading from a papyrus roll. In the distance is the Areopagus of Athens. The mosaic is of the finest execution, and the marble cubes, of which it is composed, are of bright and varied colours. A further portion of the town wall has also been cleared, and found to be of pre-Roman period, being constructed in the Oscan style; and at the south-western point of the city a temple which was in course of construction has also been discovered. In extending their cemetery the municipality of Caserta have come upon the remains of a classical necropolis, the tombs of which are quite likely to yield important objects. In making a new railway in the neighbourhood of Avellino, another classical necropolis has been accidentally disclosed in the past year, and if excavations are continued there they may quite well be productive of satisfactory results.

**Electric Locomotives.** THE question of the ventilation of the Underground Railway has been under consideration for quite a long time, and at last it seems likely that something will be done. In reply to a question in the House of Commons, Mr. Ritchie said that in 1897 he appointed a committee to inquire into the system of ventilation of the tunnels of the Metropolitan Railway, and the report of the committee and minutes of evidence were presented to the House in the same year. As recently as December last the managing director of the Metropolitan Railway informed the Board of Trade that the directors of that Company, conjointly with the District Company, had secured the services of Sir J. Wolfe Barry and Mr. W. H. Preece, and instructed them to provide the necessary electric plant and appliances for the equipment of a section of the line for experimental working. Mr. Ritchie expressed a hope that these experiments might result in the adoption of some system of electric traction.

**The Nimble Surveyor.** SPEAKING in the House of Commons the other night, Col. Sanderson, in his humorous way, threw a side light on the manners and customs of county surveyors and road contractors in Ireland. "At the road sessions in Donegal the other day," said the honourable and gallant member (we quote this from the "Times" report), "the deputy county surveyor refused to certify work done on the roads on the ground that the work had not been done. (Laughter.) This was looked upon by the road contractors as a monstrous piece of injustice, and they made for him. The deputy surveyor, being a nimble man,

flew out through the window like a comet, pursued by the road contractors. He fell on a roof and then plumped into the street, followed by the road contractors (laughter), and ran for two miles along the railway and got into the station, and so escaped." The story was used to point a political moral, with which, of course, we are not concerned. From our point of view the moral seems to be that no one should apply for the post of surveyor in Donegal who is not a good sprinter.

#### Somerset House.

SOME alarming reports have been circulating lately as to the alleged dangerous condition of Somerset House in regard to protection against fire. In the House of Commons last Thursday, Mr. W. Ambrose asked the Secretary to the Treasury "whether some of the rooms in Somerset House in which valuable registers were kept were divided by wooden partitions and lath and plaster walls, and whether naked lights were permitted in the galleries and passages of the building; and whether, having regard to the importance of safely preserving such public books and documents, he could give an assurance that all possible precautions were taken against fire and other dangers." In reply, Mr. Hanbury stated that no such valuable papers were stored in rooms of the description stated. He admitted that naked lights were used in some of the galleries and passages, but safety lamps or electric lights alone were used in the strong rooms, and electric light was gradually being substituted for gas throughout. The building was very carefully guarded, and was fully equipped with fire appliances, and there were caretakers and night patrols, whilst a special fireman was employed in the Probate Registry during the night. This is reassuring as far as it goes; but the minister was, of course, only repeating the reports of the Somerset House officials, who would naturally minimise the danger. Many visitors to Somerset House have remarked on the apparent absence of precautions against fire, and it is to be hoped that now public attention has been drawn to the matter some further steps will be taken to guard against the possibility of what might be an irreparable calamity.

#### Covent Garden Theatre.

THE Grand Opera Syndicate have authorised the carrying out of a very comprehensive scheme for lighting the stage at Covent Garden Theatre for the coming opera season. The scheme has been prepared by Mr. Wingfield Bowles, and the contractors are Messrs. Townsend, Tamplin, and Kakouski. The entire stage and its appurtenances will be electrically lighted. The necessary current will be taken from two stations to meet the exigency of any failure to the supply, and hence two distinct systems of wiring are being run. Four sets of different coloured lights—white, red, blue, and amber—will be used throughout. Numerous combinations are hence possible. Very elaborate regulators from Mr. Bowles' own patented designs are being put up, and many of the other appliances which he has specified are patents of his own. The installation will be the largest in the metropolis, no less than 2880 lamps being used on the stage proper. This elaborate scheme may be regarded as the first fruit of the spirited policy which led to the appointment of Mr. Edwin O. Sachs as technical and architectural adviser to the Syndicate.

#### Finds in the Forum.

FROM recent reports as to the progress of excavations in the Forum at Rome, it appears that below the floor of the Temple of Vesta four brick walls were discovered (probably built in the time of Hadrian), which form a kind of chamber. Searchers for marble in the sixteenth century may have spoiled one of the walls. The chamber is supposed to have served as a depository for the ashes of the sacred fire, which were taken from the Temple once a year. Several fragments of the reconstructed Temple of Julius Caesar have been found in a retaining wall which forms a kind of embankment to that side of the Forum. One of these

fragments, nearly a cubic yard in size, is very finely decorated with a bull's skull or boucranon. Near the Comitium was found a black stone, or rather a pavement of black marble, three metres seventy-five centimetres by four metres in extent. The slabs of black stone are very thick. The pavement itself was protected by a kerb of travertine, or ordinary Roman stone, and in the fourth or fifth century a marble fence was erected around the kerb, which evidently implies that some tradition of sanctity hung about the spot. As the use of black marble for such purposes is most unusual, there can scarcely be any doubt that this black stone is what was called in the old days "The Tomb of Romulus." The discoveries also include numerous wells lined with fragments of marble, most of which is ninth century work.

#### Mr. Ruskin's Portrait.

THE deputation which waited upon Mr. Ruskin at Brantwood, on his birthday, were anxious to gain the professor's consent to his portrait being painted by Mr. Holman Hunt, and that he should accept the same, as a gift from his admirers, for himself or for the Guild of St. George. Mr. Ruskin had, however, previously heard of the proposal, and, owing to the state of his health, felt himself unable at present to encourage the project. After the deputation had discussed the matter with Mr. and Mrs. Arthur Severn, it was felt desirable to leave it in abeyance, and not to interfere with the undoubted happiness of the professor on his birthday by endeavouring to gain his assent to a proposal which seemed to disturb him. It is to be hoped that later on something may be done to secure the portrait of Mr. Ruskin by one of the great artists, and, in the meantime, it is a matter of great satisfaction to know that, in addition to the well-known portraits by Mr. Millais, Mr. G. Richmond, and Mr. Herkomer, portraits have been painted recently by Mr. Arthur Severn and Mr. G. W. Collingwood.

#### A Splendid Avenue.

THE decoration of the Sieges-Allee, in Berlin, with the white marble statues of the rulers of Brandenburg and Prussia, says the Berlin correspondent of the "Daily Chronicle" is nearing completion. Of the thirty-two groups which will line both sides of this beautiful avenue, ten are already complete, and seventeen others well advanced. The Kaiser, whose present these are to the city of Berlin, takes the greatest interest in the undertaking, and pays frequent visits to the sculptors, assisting them with his extraordinary knowledge of the details of costume and armour. The Brandenburg and Prussian rulers whose statues have not yet been begun are the Electors Johann Georg, Joachim Friedrich, Johann Sigismund, King Friedrich Wilhelm II., and the old Emperor Wilhelm I. It is computed that the thirty-two groups when completed will have cost the Kaiser nearly £100,000. The Sieges-Allee decorated with these thirty-two groups in white Carrara marble will be one of the most magnificent avenues in the world.

#### An Architects' Menu.

THE annual dinner of the Cardiff and South Wales and Monmouthshire Architects' Society was held at the Royal Hotel, Cardiff, on the 11th inst. The gathering was representative, and the affair was a complete success. Mr. C. B. Fowler, F.R.I.B.A., president of the society, presided. Evidently, someone of waggish propensities had a hand in the preparation of the menu, which was as follows:—*SPECIFICATION.*—*Preliminary Survey:* Native Oysters; *Setting Out:* Clear Mock Turtle, Puree of Tomatoes; *Foundations:* Boiled Turbot, Hollandaise Sauce, Fried Smelts, Tartare Sauce; *Damp Course:* Braised Sweetbreads and Spinach; *Joinery:* Boiled Fowls and York Ham; *Walling:* Sirloin of Beef, Saddle of Mutton, Cauliflowers, Brussels Sprouts, Baked and Boiled Potatoes; *Roof:* Roast Pheasant; *Certificates on Account:* Plum Pudding, Mince Pies, Champagne Jellies, Apple Tart; *Final Certificate:* Dessert

#### The L.C.C. and Electric Lighting.

THE London County Council's policy with regard to electric lighting was defined at last week's meeting. The Council adopted the whole of the Highways Committee's recommendations proposing that opposition be offered to the twelve applications now before the Board of Trade for electric lighting provisional orders, in order that the interests of the consumers may be duly safeguarded. The policy of the Council as defined by these recommendations is: That the initial price to consumers shall not exceed 6d. per unit; that the supply shall be by continuous current; that when an order has been granted to a private company, the local authority may subsequently be granted an order enabling it to establish competition with the company; that when a local authority has obtained an order, a private company may not be allowed to set up a competing supply.

#### An Expensive Job.

It may be supposed that the London County Council will in future fight shy of widening railway bridges. Its last undertaking in this line has proved a very bad bargain. In 1894 the Council decided to widen Trinity Road Bridge, which runs over the South-Western Railway at Wandsworth. The estimate was £2650, but the cost has amounted to £5828 15s. 3d. The excessive cost seems to be due to the "cussedness" of the company, who would only agree to widen the bridge subject to a condition that the Council would pay the whole of the cost whatever it might be. If the Council would not agree to that course, the company demanded from the Council a penalty of £500 for every five minutes' interference with the traffic. Faced with these two unpleasant alternatives, the Council chose what seemed to be the lesser evil of letting the Company do the work and paying the bill. The payment was sanctioned—not altogether cheerfully—at last week's meeting.

#### A Good Bargain.

THE Olympic Theatre is for sale, price £12,000. The Improvements Committee of the London County Council recommends its purchase by the Council. The site, which covers an area of 13,160ft., will be required in connection with the proposed new thoroughfare from Holborn to the Strand. "We have ascertained," say the committee, "that the lessee holds for an unexpired term of fifty-one years, from Dec. 25th, 1898, at a rent of £2250 per annum." To acquire the property before the improvement is sanctioned by Parliament would seem at first sight to be an act lacking in common prudence. But the point is that, if the Council does not buy the theatre now, it is extremely probable that a speculator will; and the valuer estimates the saving to be effected by purchasing immediately at £25,000. Even in the event of the Council's Bill being rejected by Parliament—a most unlikely contingency—the Council would have, the committee points out, a valuable asset in the lease of the Olympic Theatre.

#### A New System of Incandescence by oil

has been tested at Sheffield. The lamp, which was suspended from one of the pillars which carry the electric cables, was of one thousand candle power. This particular lamp is manufactured by the Kitson Hydro-Carbon Heating and Incandescent Lighting Company, and is peculiarly brilliant and at the same time very soft and exceedingly steady. The lamp consists of an incandescent mantle—the improved Welsbach—an oil vapourising tube, which is placed and supported immediately above the mantle, and receives heat therefrom, and an oil supply tube, in which the oil vapour or gas is injected, and which serves to convey the mixture of air and vapour to the mantle. The oil tank and pump are placed at the base of the pillar. Each lamp is worked independently, but on one charging it will burn for 10 hours. For each mantle of between 450 and 600 candle power, it is said the cost of the petroleum will equal about one farthing per hour.

## Keystones.

**A New County School** is to be erected at Pontyvain, and the plans have just been passed.

**St. Paul's Cathedral** is to be illuminated by electricity, and the installation will cost some £5000.

**New Law Courts for Leeds** are proposed, and will form one of the first items on the agenda at the meeting of the City Council on March 1st.

**The New Empire Palace Theatre**, at South Shields, just erected by Mr Richard Thorn'ou, was opened to the public last Monday week. Mr. Frank Matcham is the architect.

**Llantwit Major Church** is to be repaired. The work has been placed in the hands of the diocesan surveyor, Mr. Geo. E. Halliday, F.R.I.B.A. The Western, or parochial, church is the most in need of repair, and this will be undertaken first.

**An Accident in Aberdeen.**—The gable of a house in course of erection in Ann Street, Aberdeen, fell last week, with the result that three masons were seriously injured and another killed. The accident is attributed to the recent heavy rains, which had loosened the lime.

**The New Technical Institute** and School of Art erected by the Kingston Corporation and the Surrey Council was formally opened last Saturday week. The buildings have been erected under the superintendence of Messrs. Lainson and Son, architects, of Brighton.

**Clonfert Cathedral.**—The restoration of the Chancel of this picturesque and historic building is now complete, but £1000 will be required to restore the nave and £1000 to rebuild the transepts. A strong effort is being made by some of the Irish clergy to raise the additional sum required.

**Eldon Street Arcade, Barnsley**, is, we understand, to be purchased by the Town Council, for extensions to the Kendray Street Market, which it adjoins. The purchase price is said to be £4800, and it is suggested that the purchase is necessary in order to reserve a large plot of land, recently cleared but now laid idle, as a site for municipal buildings.

**The House of Lords** is undergoing an important structural improvement just now in that part of the House which was formerly devoted to the chief librarian. The various rooms of the house are being reconstructed. The drawing room has been converted into an additional committee room, whilst the dining room, it is stated, will henceforth be used as a smoking room, in connection with the library. It is understood that in due course the rest of the building will be appropriated in like manner.

**A Relic of Old Scarborough** is being destroyed by the reconstruction of the Newcastle Packet Inn, on the Sandside. The hostelry dates from the middle of the fifteenth century, a crocket and Gothic canopy carving in very low relief, interspersed with battlements and vine leaves, fixing the date as near as possible. During the excavating of the cellar a fragment of the old town wall was unearthed. The building was partially constructed of old ships' timbers, which were found to be still quite sound.

**The Admiralty Buildings'** new block, now being erected at a cost of nearly £200,000, will probably be ready for occupation by about the end of the year. There are about 300 men engaged upon it. It will doubtless shortly be decided whether a third new block will be set up on the Horse Guards side, or whether the original idea of a covered corridor will be carried out. The Naval increase since this scheme was first planned has rendered a third block absolutely necessary; but there seems to be some reluctance to shut the quadrangle quite in, and, as an alternative, it is, we understand, proposed to put another building to adjoin the old Admiralty and the one just completed at the north-west corner.

**The Extension of Stonehaven Harbour** has been decided upon by the Police Commissioners at a cost of about £11,000.

**Electric Lighting of Lincoln** formed the subject of a Local Government Board inquiry into the proposal to borrow £19,000 last week.

**A New Poorhouse at Aberdeen** is proposed, and the proposal has been referred to the Works Committee of the Parish Council to report upon.

**The Building Fund of the New Roman Catholic Cathedral** at Westminster amounts to £90,790. Lord Brampton has undertaken to defray the cost of a side chapel dedicated to St. Gregory and St. Augustine.

**New Municipal Buildings** are to be erected at Peterborough. The Town Council has paid £11,000 for the site alone. The town has been growing in importance lately owing largely to the development of the brickmaking industry.

**Footway under the Thames.**—The London County Council have decided to proceed with the projected footway under the Thames at Greenwich. The tender of Messrs. John Cochrane and Sons for the work has been accepted, the price agreed upon being £109,950.

**A New Church for Stoke-on-Trent.**—The foundation-stone of the new church of St. Barnabas, at Penkull Allotments, Stoke-on-Trent, was laid last Thursday. When completed the church will provide accommodation for from 600 to 700 worshippers; but at present only a portion of the building is to be erected.

**A Technical School for Durham** is to be erected on a site in South Street. The executive of the Durham Mechanics' Institute have signified their intention of handing over their premises to the trustees of the new schools, or, in lieu, selling the premises and devoting the proceeds towards the cost of the new school. The estimated cost of the new school is about £5500.

**The Site for the Millais Memorial Statue** has been fixed upon at last. It is decided to place the statue on the principal flight of steps in front of the entrance portico, or, as an alternative, in one of the open spaces in front of the National Gallery of British Art at Millbank. It has been also decided to ask Mr. Thomas Brock, R.A., to undertake the execution of the statue.

**Stonehaven Corporation** has erected a model lodging-house, and it was opened last Tuesday week. The building, which is from plans by Messrs. J. and J. A. Souttar, architects, Aberdeen, is of a plain but substantial character. It is situated to the east of Allardice Street. The house contains about forty cubicles, each cubicle being 4ft. by 7ft. The "Model" has cost some £1400.

**Railway Improvements at Rhyl.**—The London and North-Western Railway Company have decided to make very extensive additions and improvements at the present inadequate railway station at Rhyl. The scheme includes the provision of a double set of rails, one for fast and one for local traffic. The railway station will be almost entirely reconstructed. The down platform, which is to occupy the site of the present goods shed, will be 1000ft. in length and 80ft. in width. At the west end of the platform, a "bay" will be constructed 500ft. long, with two platforms each 25ft. wide. These latter will be devoted to passengers using the Vale of Clwyd line. Other features of the down platform will be the erection of a handsome building of red pressed bricks and terra-cotta dressing, containing waiting-room, booking-office, cellars, lavatories, &c. The up platform will be lengthened to 1300ft., and also considerably widened, and the two platforms will be connected by a handsome bridge, built in two portions, one for the use of passengers and the other for luggage, which will be raised and lowered to and from the bridge by hydraulic lifts. Messrs. Gates and Thomas, of Warrington, have secured the contract, which is expected to occupy two years before completion.

## Professional Practice.

**Aberdeen.**—The Aberdeen Town Council Plans Committee had recently before them the plans of a large building about to be erected in Union Street by the Scottish Temperance Life and Accident Assurance Company, Limited. The new building is to be built on the site of the dwelling-house 154, Union Street, next the Royal Bank. The present building will be demolished and large and handsome business premises erected in its place. The new building will have a frontage to Union Street of 34ft., the site extending backward about 100ft. to Diamond Lane. It will be of grey granite, finely dressed, with architectural features in the front elevation of a handsome character. It is to be five stories high. The new building—for which Messrs. Jenkins and Marr are architects—is estimated to cost about £5000.

**Birkenhead.**—There is now in course of completion, adjoining the Theatre Metropole in Grange Road, a building which promises to be one of the finest bakeries in the North of England. It will be known as Reynolds' Bakery. The buildings stand upon 860 square yards, and it is not too much to say that every foot of space has been taken full advantage of. The new building will have a distinctly ornamental appearance, bricks and terra cotta of handsome design having been imported from the works of Messrs. Dennis, Ruabon. The bakery proper occupies a space 40ft. square, and is three stories high, the topmost floor being used as a store-room. By an ingenious arrangement the flour, along with water, is deposited in a patent mixer, where it is mechanically kneaded into dough of proper consistency. Other machinery provides for the partition and weighing of the dough and deposits it into the usual tins. These are placed upon a large iron plate, and this in turn slides into the oven. A thermometer occupies a prominent place in front of the oven, and the baker can by this ensure that a proper heat is maintained and that the bread is not disturbed until the baking process is completed. When the loaves are taken out they are placed upon cars which convey them to the cooling room and from thence to the shop, the bread being all the time kept under shelter and in no wise handled until it passes over the counter to the customer. The whole of the buildings will be lighted by electricity. The building contract has been intrusted to Mr. R. Allen, Cloughton Road. The architect is Mr. T. T. Rees.

**Bristol.**—At the meeting of the Bristol Society of Architects held last week the question of the competition for the proposed new library was discussed, and, after hearing the report of the deputation to the Libraries Committee, the members resolved that, in default of an independent professional assessor being appointed, they would adhere to their original determination not to compete. Surprise was expressed that the Library Committee had refused to accede to so reasonable a request, the ostensible intention of the competition being to obtain the best design.

**Douglas, I.M.**—Mr. A. Marshall Mackenzie, A.R.S.A., F.R.I.B.A., is the architect for the head office at Douglas of the Isle of Man Banking Company, Limited. The new bank, which is to be built of Aberdeen granite at a cost of £13,000, will occupy a site at the junction of the principal thoroughfares, Athol Street and Prospect Hill. It is intended to commence its erection at Whitsuntide, when the company obtains possession of the site. The style of architecture is Renaissance, and it has a fine bold effect, combining the appearance of great strength and stability with lightness and grace. The whole of the exterior will be executed in finely-axed granite, and the interior of the lobby will be of polished granite, and of different shades of colour.

**Leeds.**—The plans for the smallpox hospital which the Corporation of Leeds intend to erect on the Killingbeck Hall estate, outside the city boundary on the road to York, have just been prepared by Mr. E. T. Hall, and will shortly be submitted for the consideration of the Sanitary Committee. According to the plans, the new hospital is to be on the pavilion system, and to provide accommodation for 104 patients. It is proposed to build three pavilions, each with provision for thirty beds, and two isolation pavilions with seven beds in each. In addition there will be administrative quarters, nurses' home, servants' rooms, admission and discharge premises, and a mortuary. The hospital is to be situated on the highest part or plateau of the estate, it will be within a ring fence, and, in compliance with the Local Government Board's requirement, will be fully a quarter of a mile away from any of the Corporation's other infectious diseases buildings at Manston. Provision is made according to the plans for an administrative staff of sixty-one. The building will be a completely separate hospital in every particular of administration except in regard to the resident medical officer and matron, it having been thought unnecessary to have a medical officer in permanent residence.

**Merthyr Tydfil.**—The case of *Jenkins v. the Merthyr Tydfil District Council* came before Mr. Justice Lawrence and Mr. Justice Channell last Tuesday week in the Queen's Bench Division of the High Court. Mr. S. T. Evans, M.P., appeared for the appellant, and Mr. Macmorran, Q.C., and Mr. Plews for the District Council. This was an appeal on a special case stated by the Stipendiary Magistrate of the Merthyr Tydfil Court under section 3 of the Public Buildings and Streets Act 1888 (51 & 52 Vict.), and penalty had been imposed on appellant for erecting a building beyond the existing frontage line without the consent of the Urban District Authority. Mr. Jenkins was the owner of some houses in Union Street, Dowlais, and submitted two sets of plans of alterations to the premises, of which the local authority disapproved. A third plan was submitted, and there was no objection at all taken for over two months, until June 6th, when notice of disapproval was sent. Meantime the work had been done. The new buildings were inspected by the surveyor, and a certificate was given and the new buildings occupied. On June 27th—sixteen days afterwards—an information was laid against the defendant under the section. This summons was dismissed, but on August 19th further notice was given to the appellant calling his attention to the fact that the building were not in line, and on a second information a conviction took place on October 13th. The penalty was the nominal one of one farthing a day from August 19th to September 26th with costs. There were several points the appellant relied on, namely, that the third plan ought to have been disapproved within a month, that the summons having been dealt with once in August could not be tried over again in October, and that the District Authority acquiesced by their inspection of the building. Their Lordships sent the case back to the magistrates for further information before entering judgment finally, though they decided all points against the appellants except the question as to the two trials, which was reserved. Costs were reserved.

**Newcastle.**—The "conditions of competition" which are to be observed in the preparation of designs for the building of the new infirmary upon the Newcastle Leazes have been issued to the eighteen selected architects. The designs are to be for an infirmary containing 400 beds. The accommodation for nurses is to be—with the exception of the dining halls and ward sisters' rooms—separated from the working part of the hospital. Special care must be taken to preserve sufficient open space between the buildings, and to arrange the pavilions so that the intermediate space lies, for the most part, open to the south. The principal large wards must be built upon the pavilion system,

each bed having a window on either hand. The dimensions of the wards and rooms are for the most part left to the competing architects; and, while attention is called to the schedule of accommodation required, they are requested in their plans to make such provision as is now thought necessary for a large general hospital attached to a medical school. The entrances for public use must be as few as possible. The designs for the new infirmary must provide accommodation for 400 patients, with the necessary out-patient and pathological departments. To the author of the design which, in the opinion of the Committee and Assessor is most worthy of it, will be awarded the work of carrying his design into execution at the usual commission of 5 per cent. To the authors of the three designs which, in the opinion of the Committee and Assessor, are next in order of merit, will be awarded the respective premiums of £150, £100, and £50. The clerk of the works will be paid by the Committee. The designs will be submitted to Mr. Alfred Waterhouse, R.A., who will advise the Committee in their selection.

**Sheffield.**—The City Hospital Committee have had under further consideration the cost of the proposed additional hospital accommodation at Lodge Moor. Messrs. Flockton, Gibbs, and Flockton, architects, reported that their estimate for the further extension of permanent buildings at Lodge Moor is £45,777. The whole of the buildings are designed of an absolutely plain character, to be built of rock-faced stone, the inhabited parts alone to have hollow walls, and to be lined with brick, the pavilions to be plastered internally with cement, and to have teak floors, both being necessary in an infectious diseases hospital. The committee resolved:—"That, having given careful consideration to the question of the provision of additional accommodation at the Lodge Moor Hospital, this committee reaffirm the resolution passed by them at their meeting on the 21st December, 1898, namely:—"That six single-story stone wards, capable of accommodating 22 beds each, be built on the south side of the present building at Lodge Moor, and that application be made to the Local Government Board for their sanction to the borrowing of the sum of £45,777, to pay the cost thereof."

**Wellington.**—A great amount of interest is being taken in the development of various industries in East Shropshire, and the impending influx of a large number of workmen into the district has resulted in schemes being propounded by several syndicates with the object of providing house accommodation. A scheme has been formulated by Dr. Whittaker (medical officer of health for the Wellington district) and Mr. Myles Morley (surveyor to the Wellington Urban Council) to erect sixty workmen's dwellings, to be let at rents varying from 4s. to 7s. per week, at Wellington. To carry out this most of the dilapidated cottages in the town, forty of which have been condemned as unfit for human habitation, will be demolished. Another and more extensive scheme is being undertaken by a number of gentlemen in Birmingham, Wolverhampton, and Wellington, to acquire what is known as the Vicarage Estate, situated on the old Watling Street Road, not half a mile from the foot of the Wrekin. It is proposed to erect detached villa residences on the estate, and upwards of £100,000 will be expended. It has been felt for some time that the scarcity of house accommodation has retarded Wellington's progress. Building operations will commence almost immediately, and already there is a great demand for houses. There is an excellent water supply from the foot of the Wrekin, where three reservoirs are located, and there is a storage capacity of 25,000,000 gallons, or a supply sufficient for 170 days. The water gravitates to the town, and it is intended during the summer to increase the storage capacity so as to provide enough water for 250 days. Mr. Dalgleish, architect, of Wellington and Shrewsbury, has been instructed in connection with the several building schemes.

## Views and Reviews.

### AN INDISCRETION.\*

This book is of the chatty order. As an essay in pure chattering it is a *tour de force*. On the front page Miss Merrick introduces herself to her readers thus: "I am an artist, a student of the Royal Academy, and two years after my admission by competitive examination into those schools took first silver medal for painting a head from life;" and thereafter follows an account of the presentation of the medal in question, and the subsequent adventures of the lady as a portrait painter in this country, in Egypt, and in India, where she found a variety of subjects for her brush ranging from Mr. H. M. Stanley to the Maharajah of Dholpore. She went to India to paint the Maharajahs and their wives, knowing that in many of the native courts no man is ever admitted to the presence of the latter, and therein discerning an opening for a lady artist. She met with no little success, and, from the candour with which she enters into the business details of her art, it would seem with no inconsiderable gain of lucre. Such bright, unusual experiences, might be expected to awaken the observation and intelligent curiosity of the ordinary superior young person, but Miss Merrick has passed through these kaleidoscopic scenes with much the same mental attitude as that of people who make the whole romance, and pathos, and adventure of life, subservient to the collecting of used penny stamps. Miss Merrick's book is crammed with such valueless, commonplace gleanings. She tells prolifically how late the train was; how it came near to rain; what time dinner was, what time breakfast, what tiffin; what the weather was like when Mr. Stanley came to Cairo; what Mr. Stanley said when she painted his portrait ("Take care of my eyes, for Stanley's eyes are known all over the world"); what a score of other sitters said; and withal, accounts of pleasant inanities and courtesies delivered to her on the subject of her paintings; of nobles that have bowed to her, of other nobles who have shaken her by the hand; the clothes people wore, and the compliments they paid. Of the inner life and manner of the Zenana, which she had peculiar opportunities of observing, she tells us little, although the few things worth writing down which find place in the volume appear in this connection. Miss Merrick is much pleased with herself, which is quite right and proper; but it is necessary to abrogate the sentiment in such hours as one is employed writing for the pleasure of other people. If she had done this she would not have described how Dr. Parke bowed to her on the occasion of the reception of the Stanley relief party in the Albert Hall. It may have made her own pulses rise, but it will impress the reader not at all, except to convey to him that Dr. Parke had the manners of a gentleman. Personally, we like that page of the book best which displays a photograph of the fair writer, and assures us in facsimile of her own autograph that she is "ours sincerely." Is this revelation the secret of the unstinted compliments which the lady's pictures seem to have universally won? Even Mr. Ruskin has admitted himself a devotee by her showing. She saw him looking at a picture of hers, and ran up and asked for a criticism. "Charming! Charming! Charming!" murmured Mr. Ruskin. Miss Merrick states at the outset that this book was written in consequence of friends who cried, "Why don't you write a book?" We all know those friends. The book has been written apparently for friends, and in our opinion should have been privately printed for their benefit. We think Miss Merrick will regret that she was ever persuaded to publish it.

# Under Discussion.

## ELECTRICAL TRAMWAYS.

At the last meeting of the Yorkshire College Engineering Society, Mr. E. Talbot, A.M.I.C.E., consulting electrical engineer to the Corporation, gave an address on Leeds City electrical tramways. The chair was taken by the president, Mr. J. H. Wicksteed, I.C.E. After describing the circumstances under which the electrical system came to be installed in Leeds on Roundhay Road, how that line was afterwards taken over by the Corporation, as well as the whole of the tramways of the city, Mr. Talbot dealt with different means of electric traction. No system, he said, might as yet be perfect, but experience, he thought, had shown that the overhead method as at work in Leeds was the best. The accumulative and conduit systems might at first sight appear to have advantages which the overhead did not possess, but it had been found that, either on account of expense or inconveniences of working, neither of these systems had met with the amount of approval it had been won by the overhead method of working. That was proved in the fact while there had been but little progress made with the other two systems, much had been done in the development of the overhead. The conduit was certainly very much more costly. The overhead might appear somewhat unattractive, but it was the most practicable. That had been a success in Leeds was shown in the extension of it that was now taking place. At the present time there were fourteen towns making progress with the system. As to the reason why many more towns had not the benefits of electrical traction, it might be found in the fact that many tramway companies, with their leases nearing completion, naturally did not care to go to the great expense of installing a costly electrical system and then be subjected to the risk of having to sell their concern almost as so much scrap iron.

## ENGINEERS, CONTRACTORS, AND NAVVIES.

Mr. Wm. Hirst delivered a lecture recently to members of Plymouth Institution, the subject being "Notes on Engineers, Contractors, and Navvies." Mr. W. H. K. Wright, president, occupied the chair. The lecturer stated that the public works executed in England during the century justifying far exceeded all that had ever been done before in this country, and he claimed that this mighty upheaval of energy, all devoted to the public weal, had been accomplished principally by engineers, contractors, and navvies, who had transformed the modern world. The anxieties and difficulties of engineers were great. Apart from natural obstacles, they had often great difficulties to overcome in the shape of actions by owners or occupiers of land and property. These difficulties, however, were not so great now as formerly, and, despite the hardships of engineering field work, members of the Profession were well known to be able to take care of themselves. First under George Stephenson the contracting system grew up, and we know it to-day. The early projectors of railways soon found that if the work was done by contractors, bar accidents, they knew pretty well what it was going to cost. They knew that, with a rigid contract, they would not easily be seduced into sudden changes of plan by their engineers. In the old days, when very little was known of the value of labour or materials for the execution of public works, or the difficulties and liabilities of their construction, owing to all new and strange, tendering with a view to getting into a contract was very different from what it was now. It was the contractor who had to give bodily form and shape to the directing the great sources of power in the use and convenience of man, and at the present day had to enter into a minute dissection of the multi-valued elements which obtained in the actual

giving of that form and shape. A contractor must be a good mental arithmetician, liberal-minded, calm, and equable in temperament, not upset by great success or great failure. As railways were the exclusive offspring of British genius, so the navy of navvies was of British type. He was not revengeful, and, if thriftless, he was neither mean nor avaricious. To a great degree of Danish or Saxon descent, and, uncorrupted by social vices, the pure navy, taking him zoologically, was a fine animal. His large bones, great muscular energy, and love of good living indicated his Teutonic origin, not less than his tractability, inclination for work, and downright honesty and spirit of independence. He was no sham, and gave work for the money. Treated well, and kept from drink, his behaviour was unexceptionable. No human being was capable of going through such a great amount of bodily work with more cheerfulness. The lecture was enlivened with interesting anecdotes and illustrated with a number of lantern slides, which included scenes on the Manchester Canal works, and also on the Keyham Extension Works, on which latter the lecturer is engaged.—In opening the discussion, in which high appreciation was expressed of the lecture, Mr. J. C. Barter said he was glad of the eulogy of labour it contained.—Mr. Penrose France suggested that the navy was a distinct type of labourer who followed this sort of work as his own particular occupation. He regretted the lecturer's remark, that the modern navy had physically deteriorated as the result of compulsory education and more indoor school confinement than was the case twenty or twenty-five years ago.

## A NEW ELECTRIC LAMP.

At a recent meeting of the Society of Arts, Mr. James Swinburne described a new form of electric lamp, the invention of Professor Walther Nernst, of the University of Göttingen. The efficiency of an incandescent body, as far as radiation went, said Mr. Swinburne, depended simply on the temperature. The efficiency of an incandescent lamp, for instance, depended on the temperature of the filament only, providing there was no loss by convection. The carbon would not stand a sufficiently high temperature, especially as, in addition to its low specific resistance, the filament had to be long and slender, and thus weak. Nernst, therefore, chose a material that would stand higher temperatures than carbon, and his material had the incidental advantage that its specific resistance was so high that strong rods could be used for high pressures instead of thin filaments. The most refractory material so far used in lighting was zirconia, which had been used to replace lime in the limelight, and the oxides, or rare earths, in the Welsbach mantles. Nernst took highly refractory oxides as his material.—It did not seem promising, because these oxides were notoriously good insulators. But such insulators are electrolytes when hot. Nernst, therefore, heated the rods to make them conduct, and then heated them electrically, preserving a temperature which was within the limits that the material could bear without softening. This meant that he could take the most refractory bodies supplied by the whole range of chemical research, and could heat them to a temperature short of their softening point, and could thus get an efficiency unknown to workers on the incandescent lamp. Such efficiency also meant whiteness of light, so long as the efficiency was not too high. The advantages claimed for the Nernst lamp are that it has a much stronger filament, which does not need enclosing, and which burns in the open air. This filament is essentially a thin rod of a very refractory substance, which will not convey the electric current at ordinary temperatures, so has to be heated to a dull red heat before the electric current will flow. This auxiliary heating may be effected by a match, candle, taper, spirit lamp, or by an automatic electric heating device. Once the rod is hot enough, the electric current flows and raises it to a white incandescence, which is maintained until the electric current is turned off.

## THE ARCHITECTURAL ASSOCIATION OF IRELAND.

A meeting of this Association was held in the Grosvenor Hotel, Westland Row, on the 14th inst., Mr. Geo. P. Sheridan, A.R.I.B.A., vice-president, in the chair. There was a good attendance. Mr. R. M. Butler, hon. secretary, read a paper entitled "The Influence of Climate and Material on National Architecture." This paper was awarded the "Essay Prize" of the Association for 1897. The lecture was illustrated by lantern views, and the subject was very fully dealt with. The lecturer showed that in all great periods of Architecture the influences of climate and material had exercised a large influence over the art of building; that it was only when the art became corrupted and enervated, and when mere copyism was called design, that these principles ceased to govern design. It was also pointed out that the social conditions and requirements of the people had in all times exercised an immense influence on their buildings. Messrs. Walter Doolin and Joseph Holloway having spoken in very complimentary terms of the paper, a hearty vote of thanks to the lecturer was passed unanimously. Mr. E. Bradbury was elected a member of the Committee in the place of Mr. A. W. Moore, resigned. Mr. J. C. Parkinson, Armagh, was elected a member of the Society.

## INSTITUTION OF MECHANICAL ENGINEERS.

The fifty-second annual general meeting of this Association took place at the new home of the institution in Storey's Gate, St. James's Park. The chair was taken by the retiring president, Mr. S. W. Johnson, who, in opening the proceedings, congratulated the members on having assembled for the first time in the lecture room of their own house, which will probably be formally opened at the beginning of May by the new president, Sir William White.—The secretary, Mr. E. Worthington, then read the annual report of the Council, which showed that the membership in all classes had reached 2684, representing a net gain of 191 on the previous year. The receipts for the year were £8452, and the expenditure £7588, leaving a balance of £863. The total investments and other assets amounted to £36,462. References were made to the experiments carried on by Professor Beare at University College as to the value of the steam-jackets; and to those of Sir William C. Roberts-Austen, who had carried to a successful conclusion a long series of experiments, made at the Royal Mint, on the behaviour of steels during cooling. Congratulatory allusion was made to the summer meeting held at Derby and it was stated that the next summer meeting would be held at Plymouth.—The adoption of the report and statement of accounts having been moved and carried, the President announced that Sir William White had been elected President for the ensuing year, and the Secretary read the list of the gentlemen chosen Vice-Presidents and members of Council to fill the vacancies caused by resignation or death.—Mr. Johnson next invited the President-elect to take the chair.—Sir William White said that he would serve the interests of the Institution to the best of his ability, and expressed his regret that Mr. Johnson had found it impossible to continue to hold his office for another year.—Sir Frederick Bramwell moved a vote of thanks to the retiring President for the excellent way in which he had conducted the work of President of the Institution.—Sir Edward Carbutt seconded the vote, which was carried with acclamation.—Mr. Johnson, in thanking the meeting for the cordiality with which the vote had been carried, regretted his inability to accept office for another year, owing to the increased demand made on his time.—The secretary then read the "fifth report to the Alloys Research Committee," by Sir William C. Roberts-Austen.—Sir William C. Roberts-Austen's report opens with a reference to the importance of the work of the Alloys Research Committee, and its influence in relation to the proposed es-

establishment of a National Physical Laboratory. The arrangement of new modifications in the recording pyrometer, made for the Committee in Professor Roberts-Austen's laboratory at the Mint, are then described. By the aid of the modified appliance it has been possible to detect and measure in cooling iron and steel an evolution of heat due to hydrogen, similar to the well-known recalescence which occurs at 650deg. C., when the relations of the carbon and iron change. The bulk of the report is devoted to the interesting question known as the "Solution Theory," of carburised iron, which is shown to be of great industrial importance. The behaviour of certain classes of steel, more especially those used for steel rails and for the manufacture of cutting tools, is considered in relation to this theory. This portion of the subject is illustrated by elaborate curves and by micro-photography.

#### BUILDING AN UNDERGROUND RAILWAY.

Mr. Basil Mott, last Monday week, delivered a lecture in connection with the series now being given at Carpenters' Hall; his subject was "Building an Underground Railway." The lecturer, with Sir Benjamin Baker, is the engineer of the Central London Railway, and he dealt with this line. Having premised that it was only by means of underground communication that the traffic problem of the metropolis could satisfactorily be solved, Mr. Mott showed how the first "underground" railway—the Metropolitan—absolutely stopped traffic in the streets that were over the line of the rails. Now, however, a shaft was sunk on the site of a station without diverting a vehicle. As the excavations deepened the circle was lined by sheets of iron. At the necessary depth tunnels for the rails were bored in the London clay. Remarkable contrivances known as Greathead shields were forced by hydraulic pressure through the soil, and little by little the boring was cased with iron plates until it became a long tube 8ft. in diameter, devoid of every scrap of timber, and girt about outside by 3ft. of cement, which had been "blasted" into position in order to prevent any possible subsidence in the soil above. The progress of the shields was from 12ft. to

14ft. in twenty-four hours. Thirty of them working simultaneously tunnelled 500yds. in one week. By the aid of the theodolite the accuracy of the boring was marvellous. Two shields working towards each other through from half to three-quarters of a mile of soil made borings that were only an inch and three-quarters out of perfect alignment. Moreover, the structure was so solid that it had passed under Holborn Viaduct without disturbing it in any way. The difficulties at what would one day be the Mansion House Station were referred to as being of a special character. First of all the network of gas pipes, drain pipes, water pipes, electric wires, &c., had to be accommodated in a sub-way to themselves. Then public subways, upon which the Corporation insisted, had to be provided for the future relief of the traffic overhead; and, finally, the station had to be made. That was so near completion that the wooden flooring of the road, which at present rested on the steel ceiling of the station, 18in. only below the traffic, would soon give way to asphalt. Below the station ran the tunnels of the City and South London Railway, and he did not know why another line should not go below that.—The lecture was illustrated by means of a number of lantern shades.

#### ENGLISH CHURCH ARCHITECTURE.

A lecture was delivered on the 15th at the Municipal School of Art, Manchester, by Mr. H. A. Prothero, on the subject of English church architecture. Mr. Charles Rawley presided, and there was a large attendance. Mr. Prothero began by saying that just as the Church of England traced her origin partly to the ancient British Church and partly to the Roman Church, so the buildings in which she worships show evidence of having been derived from the same two sources. So far as he knew, there was no church now standing built before the landing of Augustine, but the type was to be seen in a few churches built before the Norman Conquest and still in existence. These old churches consisted mainly of two rooms, with a doorway between them too narrow to be called a chancel opening. The Roman "ancestor" was the basilica. Mr. Prothero showed by

means of photographs thrown on the screen the gradual development of the parish church as we know it now. He passed on to speak of our cathedrals and abbeys. These, he said, were at first virtually French in general plan but in time marked differences were introduced. English cathedrals were longer, narrower, and more rectangular. For one thing the English cathedrals had usually a finer line than the French, an effect mainly due to the lower height of the roofs of our cathedral.

#### "ROOFING" and other FELT

In Rolls 25yds. Long, 32in. Wide. Any quantity sent off at a moment's notice.

## CONTRACTS OPEN.

### EDINBURGH AND LEITH CORPORATIONS' GAS COMMISSIONERS. TO CHIMNEY CONSTRUCTORS.

The Commissioners are prepared to receive TENDERS for the CONSTRUCTION of a CHIMNEY STALK, 102ft. high, to be constructed at their new Gasworks at Granton, near Edinburgh.

Plans, specification, schedule, and form of Tender may be obtained on application to the Chief Engineer, Mr. W. B. HERRING, Gasworks, Edinburgh, upon payment of one guinea, which will be returned on the receipt of a bona-fide Tender.

Tenders, endorsed "Tender for Chimney Stalk," to be addressed to the undersigned and delivered at his offices on or before 4th of MARCH next.

JAMES Mc G. JACK,  
Clerk.

No. 25, Waterloo-place,  
Edinburgh,  
February 15th, 1899.

### WOOLWICH LOCAL BOARD of HEALTH.

#### TO BUILDERS AND CONTRACTORS.

Notice is hereby given that the Woolwich Local Board of Health will meet at the Town Hall, Woolwich, on TUESDAY, FEBRUARY 28th, 1899, at SEVEN o'clock in the evening, to receive TENDERS for the ERECTION of STABLING and HORSEKEEPER'S RESIDENCE in Callis-alley, Woolwich.

The drawings and specification can be inspected at the Office of the Architect, Mr. J. O. COOK, No. 1A, Eleanor-road, Woolwich, where bills of quantities and forms of Tender can be obtained upon payment of One Guinea, which will be returned upon the receipt of a bona-fide Tender.

Persons Tendering must declare that they do and will pay such rates of wages and observe such hours of labour as are generally accepted as fair in their several trades, and that they will not sublet the work except with the consent of the said Board.

Tenders to be addressed to the Clerk of the Woolwich Local Board of Health, endorsed "Tender for Stabling, &c., Callis-alley," and delivered at the Town Hall, Woolwich, before SEVEN o'clock p.m. on the said FEBRUARY 28th, 1899, after which time no Tenders will be received.

The person or persons whose Tender or Tenders may be accepted will be required to find security for the due performance of the contract.

The Board do not bind themselves to accept either the lowest or any Tender.

By order,  
ANDREW C. REED,

Town Hall,  
Woolwich,  
February 8th, 1899.

## COMPETITIONS.

### COMPETITIVE DESIGNS.

The Leeds Corporation offer premiums of £150, £100, and £50, for first, second, and third best DESIGNS respectively, for MARKET HALL and MARKET SHOPS on a site of 4560 square yards in area, which forms part of the present Kirkgate Market.

Terms of the Competition and particulars of site can be obtained on application to the City Engineer, Municipal Buildings, Leeds.

Designs must be sent in to the Town Clerk, Town Hall, Leeds, not later than JUNE 1st.

## HEXHAM UNION.

### NEW VAGRANT WARDS. TO ARCHITECTS.

The Guardians of the above Union are prepared to offer a premium of £20 for the best and most economical PLANS for new VAGRANT WARDS to be erected at the Workhouse.

Further particulars on application to me the undersigned.

J. H. NICHOLSON,

Clerk to the Guardians.

Offices:—  
Midland Bank-chambers,  
Hexham,  
January 26th, 1899.

## BOROUGH of RAMSGATE.

### WEST CLIFF, RAMSGATE, CONCERT HALL, &c., PARAGON GARDENS.

The Corporation of Ramsgate are prepared to receive COMPETITIVE DESIGNS for the ERECTION of a CONCERT HALL, READING ROOM, and LAVATORIES for both sexes, &c., on the Site named above.

Three premiums are offered to competing Architects, viz., £50, £20, and £10.

Plans of the site, with section and general instructions, may be had on application to Mr. T. G. TAYLOR, Borough Surveyor, Broad-street, Ramsgate, on receipt of a cheque for £2 2s. made payable to the Borough Treasurer, and which will be returned to such competitors as may send in plans complying with the conditions of the Competition.

The designs must be sent in not later than the 30th APRIL, 1899.

By order,

W. A. HUBBARD,

Town Clerk.

Town Clerk's Office,

Town Hall,

Ramsgate,

February 6th, 1899.

Binding Cases may be had on application to the Manager. Price 1s. 9d. each.

# WIND PRESSURES.

By C. W. TOMLINSON.

THE estimating and working out of wind forces and pressures against walls, chimneys, &c., is often a fruitful source of difficulty to the student, and, as questions upon this subject are frequently set in examinations, it is proposed to explain the matter as fully as possible within the limits of a short paper.

Hurst, in the "Architectural Surveyors' Handbook," gives the following table showing the velocity and power of winds:

Designation.	Velocity in miles per hour.	Pressure in lbs. per sq. foot.
Scarcely perceptible.....	1	·005
Perceptible.....	2	·020
Slight breeze.....	4	·080
Moderate breeze.....	8	·320
Fresh breeze.....	15	1·125
Brisk wind.....	25	3·125
Strong wind.....	30	4·50
High wind.....	40	8·00
Storm.....	50	12·50
Violent storm.....	60	18·00
Hurricane.....	80	32·00
Violent Hurricane.....	100	50·00
Gust observed in England in 1868.....	126	80·00

Hurst also remarks that near the earth's surface the velocity is probably somewhat modified by the various obstacles that are passed over.

In most examination questions set on [this subject the student is told to neglect the strength of the mortar, so that the question resolves itself into a problem in mechanics, on the principal of the lever. The pressure ( $F$ ) is a force tending to overturn the wall at a point  $A$  (see Fig. 1) near the base, with a leverage formed of half the height of the wall (or average leverage). And the force tending to keep the wall in position is simply the weight of the material ( $W$ ) acting with a leverage of half the thickness, about the same point  $A$ . Thus raise the height of the wall, and we increase its liability to be overturned, by increasing the leverage of  $F$  about  $A$ . Thicken it, and we increase its stability by increasing the moment of  $W$  about the same point  $A$ .

So a simple formula is obtained for equilibrium:

$$F + \frac{H}{2} \text{ (or half-height)} = W + \frac{T}{2} \text{ (or half-thickness.)}$$

In working out this class of problem it is usual to take only a single foot run of wall.

Then  $F$  (total pressure) =  $f$  (pressure per foot super.)  $\times H$  (height)  $\times L$  (length) which being one, may be omitted.

And on the other side,  $W$  (total weight =  $w$  weight per foot cube.)  $\times T$  (thickness)  $\times H \times L$ , omitted again.

Then the full formula runs:

$$f \times H \times \frac{H}{2} = w \times T \times H \times \frac{T}{2}$$

As an example:—

What force per foot super. will be required to blow down a brick wall, 8ft. high, 18in. thick, neglecting the strength of the mortar?

We will take the brickwork as weighing 110lbs. per foot cube. Then by the above formula:

$$f \times H \times \frac{H}{2} = w \times T \times H \times \frac{T}{2}$$

$$f \times \frac{H^2}{2} = w \times H \times \frac{T^2}{2}$$

$$f H^2 = w H T^2$$

$$f H = w T^2$$

$$f = \frac{w T^2}{H}$$

$$f = \frac{110 \times 1.5 \times 1.5}{8} = \frac{2.25 \times 110}{8}$$

$$f = \frac{247.5}{8} = 30.93 \text{ lbs.}$$

Then, as this amount of 30.93lb. is merely equilibrium, a force of, say, 31lb. per foot super

would overturn the wall. This may easily be seen by Fig. 2; where total pressure  $F$ ,  $31 \times 8 = 248$ , acting with a leverage of  $\frac{H}{2}$ , or 4 would produce a moment of 992lb., while weight  $W$ , of 12ft. cube  $\times 110 = 1320$ lb., with a leverage of  $\frac{T}{2}$  or .75 of a foot would produce a moment of 990lb., or 2lb. less. Of course, if the pressure be given, the height, or thickness to resist that pressure may be found in the same way.

In the next case let us take a chimney. This differs in one or two points, as being limited in length  $L$  makes an addition to the formula, while, in getting  $W$ , the flues must be deducted.

For example take a stack of three flues arranged as Fig. 3. What force per foot super. will overturn such a stack at a point 6ft. from the top? The over-all size of the stack, then, is:

Length: 9in.  $\times 3 + 4\frac{1}{2}$ in.  $\times 4 = 2$ ft. 3in. + 1ft. 6in. = 3ft. 9in.

Width: 1ft. 2in. +  $4\frac{1}{2}$ in.  $\times 2 = 1$ ft. 2in. + 9in. = 1ft. 11in., or, say, 2ft.

With a question like this it is wisest to

obtain the weight before commencing to work out the formula.

Full size of stack, Flues.  
6ft.  $\times$  3ft. 9in.  $\times$  2ft. = 3  $\times$  6ft.  $\times$  1ft. 2in.  $\times$  9in.  
45 cub. ft. = 15  $\frac{1}{2}$  cub. ft.  
29  $\frac{1}{2}$  or 29.25 cub. ft.

Taking the brickwork at 108lb. per cub. ft.  
Total weight, or  $W$ , = 29.25  $\times$  108 = 3159lb., say 3160.

Then  $W$ , acting with a leverage  $\frac{T}{2}$

$$f \times H \times \frac{H}{2} \times L = 3160 \times 1$$

$$f \times \frac{H^2}{2} \times L = 3160$$

$$f H^2 L = 6320$$

$$f = \frac{6320}{6 \times 6 \times 3.75} = \frac{316}{6.75} = 46.8 \text{ lbs., or } 47 \text{ lb. per ft. sup. to overturn.}$$

This may be proved as before, but in getting the moments about the given point, care must be taken to include  $L$ , the length. The thoughtful student will doubtless see that the cause of a greater force being needed to overturn the stack, rather than the wall, is (1) the height is less, and (2) a broader base is obtained by enclosing the flue, thereby increasing  $T$ , the chief factor in producing the moment of stability. Notice must also be taken of the fact that, in both cases, the strength of the mortar is entirely neglected.

**Rebuilding of Centre of Glasgow.**—The City Improvement Committee of Glasgow Town Council have recommended that the north block of the King Street area be reconstructed on a scheme which shows a rental of £2290, and charges of £572 10s. for maintenance, &c., and £607 for interest, leaving a surplus of £1110, which, capitalised at twenty years' purchase, is equal to £12 4s. per square yard of net building ground; or, treated as feu-duty and capitalised at thirty years' purchase, is equal to £18 6s. per square yard.

# THE FORMATION OF SOILS.

By GUY CADOGAN ROTHERY.

(Continued from page xi.)

**INSTABILITY OF EARTH CRUST.**—As we have seen, the crust of the earth is not stable, but undergoes upheavals and depressions. The surface of the igneous and sedimentary rocks being exposed to the atmosphere and water is eroded, and crumbled up into more or less fragmentary portions. This result of rock disintegration is what we call soil.

**WEATHERING.**—Soils are, then, formed by the weathering of rocks, that is, by the action of the atmosphere, rain, water, wind, frost, by plants, and, to a much more limited extent, by animals. The action of the atmosphere is chemical; that of rains, water and plants both chemical and mechanical; that of frost and wind is purely mechanical.

Atmospheric air is a compound of nearly four fifths of nitrogen with about one fifth of oxygen, a considerable trace of carbonic acid, aqueous vapour, some ammonia, etc. Now oxygen plays an all important part in nature. It is largely present in the crust of the globe. Professor Pretsch gives the estimated distribution of the elements in the solid crust as follows: oxygen 50.0 per cent., silicon 25.0, aluminium 10.0, calcium 4.5, magnesium 3.5, sodium 2.0, potassium 1.6, carbon, iron, sulphur, and chlorine together 2.4, other bodies 1.0. Professor Vivian B. Lewes, gives the percentage as follows: oxygen 45.5, silicon 29.4, aluminium 8.2, iron 6.3, calcium 2.4, magnesium 1.6, sodium 2.5, potassium 2.0, other elements (some sixty or more in number) 2.1.

In spite of this heavy percentage of oxygen combined with the other elements in the globe's crust, many of the minerals speedily absorb oxygen, and, when atmospheric air comes in contact with any such minerals, it has a tendency to lose part of its oxygen, which is taken up by the minerals, forming new compounds, rusts or oxides. In this process of combination the minerals are partly separated from their former mechanical or chemical unions, and their bulk is necessarily increased by the addition of the oxygen. Thus this gas causes disintegration by breaking up chemical groups, and by loosening the cohesion owing to the increase of bulk. All rocks are more or less porous, atmospheric air being found in them sometimes at very great depths. The carbonic acid is also an important factor, as it combines readily with several bases and salts, its disintegrative powers on lime being very considerable.

Water is a true chemical combination of eight-ninths of oxygen and one-ninth of hydrogen, but water will readily absorb free gases, especially free oxygen and carbonic acid. Rain in falling through the air washes it, absorbing in the process a certain amount of oxygen, much carbonic acid, and, in special localities, ammonia, and sulphuric acid. Rain beating down on the rocks mechanically disintegrates it, but as most rocks are pervious to percolation of rain, the oxygen and carbonic acid it contains have special facilities for attacking the minerals they contain. So that the action of rain is both chemical and mechanical. The same is true as regards the waters of rivers, lakes, seas, etc., which erode the banks, sweep away loose parts, and by whirling hard particles along, cause further disintegration by friction, while the gases of the waters act chemically. Currents and tides also play important parts in the physical alterations of the earth's surface. Snow, though weight for weight containing less carbonic acid than rain, is a powerful source of rock decay. This is especially true as regards snowfalls in large towns where much coal is burnt or chemical manufactures are carried on, for in such cases the atmosphere of the crowded cities is heavily impregnated with carbonic acid, sulphuric acid, hydrochloric acid, and ammonia. These corrosives are easily absorbed by the falling snow, which collects in masses on the surface of stone buildings and monuments, and the best polished hard stones are ultimately affected.

Our polluted atmosphere and snow-falls are largely responsible for the bad weathering of stone, marble, and even granite in London and other towns where like conditions prevail.

Alterations of temperature are responsible for much of the "weathering" that goes on. Under the influence of heat all things expand, and in the case of rocks their porosity is, however minutely it may be, increased. A sudden fall in temperature, intense cold, causes contraction, sometimes of a very violent nature, giving rise to fractures and fissures, into which moisture filters and collects, which ultimately freezes, expanding at the same time, thereby widening the fissures and breaking up the solid rock. Frost indeed, far more effectually breaks up rocks than heat, for in nature, unless volcanic agencies are at work, heat is rarely sufficient to actually cause fissures in the solid crust of the globe. Large expanses of ice, such as glaciers, are also powerful disintegrators owing to the action of the ice in giving rise to changes of temperature, in expanding, causing friction, and acting as a graving tool, by impressing huge boulders and scoring the rock surfaces with them. Glaciers also transport rocks and rock debris. The action of ice has played a most important part in the geological history of the globe, as any geological handbook will show.

Winds beside beating against rocks and throwing down fragments loosened by other "weathering" influences, also erode rock surfaces by driving against them sharp sand particles. Winds also influence the alteration of high and low temperature, and the humidity or dryness of the atmosphere.

Plant seeds are blown by the winds, and carried by animals in all directions. They fall on the ground, and wherever favouring circumstances prevail, they germinate, take root, and grow. Many plants will spring up in the fissures of rocks, and then their powerful roots will force their way down and around, thus widening the fissure, sometimes causing fragments to fall away, and at all events opening wider the door for the action of atmosphere, rain, and wind. The chemical action of plants is due to acid in their rootlets, by means of which they are enabled to dissolve carbonate of lime, compounds of phosphoric acid, magnesite, and dolomite salts, even if contained in rocks and stones, so that plants really eat away small particles on the surface of rocks and rock fragments. Thus, when we consider how some plants spread a huge mass of lace-like rootlets deep down and far about, we can easily see that they effectually contribute to soil formation and transformation. Plants also assimilate inorganic and organic matters from the atmosphere and store them up in the soil, principally by forming humus by their decay in or on the soil. Vegetation, both land and water, helps to eat away sea coasts and river banks, especially of a calcareous nature; but it also helps to form new land, by inducing and assisting deposits of water—or drift carried particles, and adding their bulk to form a spongy network, and consistency to alluvial and drift soils.

Finally, animals burrow in soils and rocks, adding organic matter to the soil, and facilitating the effect of weathering by means of their borings. Worms, as Darwin has shown, may largely influence the alteration of soils, both by the burrowing action and by the immense quantity of earth which passes through their bodies, and is expelled in a very finely divided state as seen in their "castings." Worms will swallow small pebbles, and pieces of rock which are split up by the humic acid in the worms' stomachs. Then, this constant burrowing causes masses of earth to be more easily permeated by air and water. Submarine rocks are often honeycombed by boring worms and crustacea. The pholas and sea urchin erode the hardest rocks, not merely the calcareous, by perforation. It has been supposed that the pholas and other species employ a chemical means to soften the rocks before using mechanical action to bore them. On the other hand, polyps, molluscs, etc., by secreting lime and silica, form vast deposits with their shells and skeletons, as we shall see a little further on.

(To be continued.)

## Builders' Notes.

**Messrs. E. H. Shorland and Brother**, of Manchester, have just supplied their patent Manchester Stoves with descending Smoke Flues to the Billericay Union Infirmary, Essex.

**Emmanuel Church, Exeter**, has been placed in the hands of John King, Limited, Engineers, Liverpool, for the entire warming and ventilation by their latest improved hot water apparatus and patent tubular exhaust ventilators.

**The Dublin Master Builders' Association** held their annual dinner on Feb. 11th. Alderman Meade, the president of the Association, occupied the chair, and the company numbered 150. The President said that during the last year the history of their Association had been an uneventful one. In common with every other body, legislation had been busy with them. He believed that the Workmen's Compensation Act, when properly understood, would be considered a good and not a very expensive one after all, because, of course, they had their friends the insurance companies to rely upon.

**The City Lunatic Asylum at Stone**, near Dartford, is to be enlarged and improved, at a cost of £85,850. The original estimates—£70,000—which the Common Council accepted in October, 1897, included amounts for the warming, heating, lighting, and engineering works in connection with the new building; but further inquiry has led to the condemnation of existing boilers, the replacing of which, together with the installation of the electric light in the asylum, has necessitated an increase in the expenses of £15,850. The Corporation have sanctioned the additional expenditure.

**The Grimsby Master Builders' Association** held their annual dinner last Friday week. Alderman G. Doughty, M.P., stated that the trade of the port would be enormous in the future if proper facilities were afforded it. He advocated the provision of a large deep-water dock fifty or sixty acres in extent, and said that, with the increased trade this would bring to the port, he believed that the population of Grimsby, instead of being 60,000, would soon be 120,000. Their rivals at Hull were on the alert. They could not agree among themselves, or Hull would have started on their new dock before now. If Hull got the Bill passed, giving them power to make a deep-water dock to accommodate steamers of any size and capacity, that port would certainly become a much more powerful rival to the port of Grimsby than it had been in the past. He acknowledged what the enterprise of the Great Central Railway Company had already done for Grimsby, but pointed to the great advantages which the proposed new deep-water dock would confer both on the town of Grimsby and the Railway Company themselves. He hoped that the Company would seriously consider the matter, so that before long Grimsby might at least be placed on the same competitive terms as Hull.

**Tests with Fire-Resisting Materials.**—The first official test, under the auspices of the British Fire Prevention Committee, took place at the Testing Station, off Regent's Park, last Wednesday afternoon. The subject under investigation was a floor, constructed by the Expanded Metal Company Limited. Sir Arthur Blomfield, A.R.A., attended to represent the Council, and among the ten representatives of the committee were: Messrs. Arthur M. Watson, District Surveyor, St. George's, Hanover Square; Bernard Dixie, A.R.I.B.A., District Surveyor, East Newington; Benjamin Tabrar, F.R.I.B.A., District Surveyor, Greenwich; Frederick Hammond, F.R.I.B.A., District Surveyor, East Hampstead; Edmund Woodthorpe, M.A., District Surveyor, Northern Division of the City of London. The test was conducted by a special

sub-Committee of the Executive, comprising Mr. Max Clarke, A.R.I.B.A. (Directing Member), Mr. Ellis Marsland (District Surveyor, Camberwell), and Mr. Charles E. Goad, C.E., with Mr. Edwin O. Sachs (Chairman of the Executive), and Mr. F. Farrow (Chairman of the Commercial Section), *ex-officio*. Among the special visitors was the Technical Attaché of the German Embassy (Mr. H. Muthesius). The official illustrated report will be issued in due course. Some account of the testing station, and of the aims and methods of the committee appeared in our issue dated February 1st.

**Prices of Metals.**—The metal markets have been more or less disorganised by the phenomenal advances which have taken place during the past few months. All the leading metals have been simultaneously affected, and have been moving upwards by leaps and bounds. Tin, which touched £100 for Straits early in January, has rapidly moved up to £112, and English tin touched £117 in Birmingham the other week. Tin is now falling, however, and is at £104 to £109. The result has been the re-opening of long disused mines in Cornwall and South Wales, and new life has been given to the decaying Cornish industry. Copper has rapidly advanced to about £73, representing nearly £20 rise on the normal rate for Chili bars last year. Spelter is realising £28, the highest figure recorded, and fully £10 above the average for several years past. Lead at £14 10s. is £1 dearer than at Christmas. Iron and steel quotations are rapidly rising to the level of 1891. Ordinary Siemens steel plates have risen £2, to £8, in three months; best tinne sheets, £2, £26 for doubles; ordinary black sheets, 30s. to £7 10s.; common bars over £1 to £6 15s. upwards. Pig iron has steadily and continuously risen during the twelve months, Derbyshire and Northamptonshire grey forge realising 52s. to 54s. The metal markets are in a state of excitement, and it is thought that when the inevitable reaction ensues widespread ruin will follow.

**The London Building Act.**—In a case, *Drury v. Rickard*, heard recently in the Queen's Bench Division the district surveyor, under the London Building Act of 1894, for the district of St. Margaret's, Westminster, appealed against a decision of Mr. Marsham, sitting at the Westminster Police Court, dismissing a complaint against the respondent, a builder, for not, after notice, amending some irregularities which the appellant said he had committed under the Act. The property in regard to which the proceedings arose was situated in Victoria Street and Orchard Street, and what was known as the Orchard Street catastrophe, by which seven people lost their lives, took place upon a block of it. The complaint was that the buildings had, in contravention of the Act, been raised to a height exceeding 80ft. without the consent of the County Council, but for the respondent it was contended that the buildings came within the exemption contained in the Act applying to structures vested in or in the occupation of a Department of Her Majesty's Government, because the Office of Works had an agreement to take them on lease for Government offices as soon as in the opinion of the officers of the Department they should be fit for occupation. At the time in question, however, the officers had not certified that they were so fit. The magistrate held that the buildings came within the exemption, and dismissed the complaint, subject to the decision of this Court upon a case which he stated. The magistrate mentioned that he had not dealt with two other points raised, viz., whether the buildings were exempt because they had been begun before the Act came into operation, and whether the County Council had acquiesced in their being raised beyond the prescribed height.—The Court held that the magistrate was wrong in holding that the building was exempt as being vested in or in the occupation of a Government Department, but sent the case back to him to deal with the two points which he had left undecided.

## Masters and Men.

**Increases in Wages Rates** affecting 578 men in the building trades are reported by the Board of Trade as having taken place during January. No decreases are reported.

**Employment during January** has been good in all the building trades, except painting and plumbing. The percentage of unemployed Union members at the end of January was 1·7, compared with 2 per cent. in January, 1898.

**The Chain Trade.**—The operatives employed in the country branch of the small chain trade in the South Staffordshire and North Worcestershire district have struck work for 10 per cent. advance. Some of the employers are willing to concede the increase demanded.

**Moulders at St. Helen's.**—The whole of the moulders engaged in the iron foundries of St. Helen's came out on strike last Friday week owing to the employers having declined to grant them an advance in wages. It appears that the moulders throughout the country have generally received an increase in wages, and the St. Helen's men made an application for a corresponding advance a few weeks ago. This was not conceded, and about a fortnight ago the men tendered notices to cease work if the increase was not granted in the meantime. Negotiations have since taken place between the masters and their men, but no satisfactory arrangement has yet been arrived at.

**The Plasterers' Dispute** has not yet been brought to a conclusion. At a meeting of the standing committee of the National Association of Master Builders of Great Britain, held at Derby on the 16th, a reply to the circular sent by them to the operative plasterers was read. The Union officials agreed not to insist in future upon foremen joining the Union, but denied any official knowledge of the objectionable practices complained of. This communication was considered very unsatisfactory, and a resolution was unanimously passed: "That unless the operative plasterers agree to discontinue the objectionable practices, as set forth in the masters' circular, by February 21st, they will be at once locked out."

**Liability of Employer for Contractor's Negligence.**—A case of some importance has been decided in the Queen's Bench Division. A telephone company were laying down wires under a street. They had no statutory powers, but had the consent of the local authority, and were acting lawfully. They had employed a plumber who undertook to make certain connections at so much apiece to the satisfaction of their foreman. Owing to the negligence of a workman, whom this contractor sent to make these connections, in plunging a benzoline lamp, with its safety valve out of order, into an iron pot (placed upon the foot-path) which contained melted solder, the metal flew up and injured a person passing along the street. It was held by the Queen's Bench Division (reversing the judgment of the deputy-judge of the City of London Court) that the Company were not liable for the damage, since the relationship which the plumber bore to them was not that of servant, but of contractor, and that, as the work, which was being done, was not an interference with the rights of others, and was not in the ordinary course dangerous to others, the Company were not liable for the negligence of the contractor or his servant.

**Trade Unions and their Critics.**—At the annual dinner of the Manchester Association of Engineers held on the 11th inst., Trade Unionism came in for some hard knocks.—Sir W. H. Bailey, in submitting the toast, "Engineering and Allied Trades," said there was a despotism ruling over the industries of Lancashire and the North of England more stringent than the feudal despotism we inherited from William the Conqueror. The

labour leaders of the country had tried to create a monopoly in labour just in the same way that the feudal lords created monopoly in land, and the country was suffering in consequence. In America there was Free Trade in labour, with the result that the men received 60s. a week and produced more and cheaper articles than they in Lancashire could possibly produce with wages at 36s. There was no limit to the ingenuity of man or to what man could do. In the United States no limit was placed upon man's genius, and every man had power to produce and use machinery to the best advantage, without restriction, with the result that the labourer obtained a better reward in the shape of higher wages. While in America a man could earn 50s. or 60s. a week, wages in this country were kept down to 36s., because the Trade Unionists had a standard equal to the lowest class of workmen in the whole district.—Mr. S. R. Pratt, in responding to the toast, spoke even more strongly. He quoted the late Colonel Dyer's remark, that they had to fight a relentless and ruthless enemy in the Trade Unions of this country. It must be thoroughly understood, said Mr. Pratt, that the enemy was inside their own doors, and they had to compete with him as well as with protective tariffs of other countries.—We hope Mr. Pratt's attitude is not to be taken as typical, for about the worst possible way of attempting to remedy the evils caused by the undoubted abuse of power on the part of individual unions is for employers to declare war on Trade Unionism as a whole, and publicly to assert that they regard their workmen as their enemies.

## Engineering Notes.

**A Promenade Pier** and pavilion is proposed for erection on the south beach, Ayr, similar to the piers at Blackpool and Morecambe.

**Conway Railway Station** is to be altered so as to reduce the existing curve in the permanent way considerably, thus enabling the platforms to be lengthened and widened.

**A water supply for Slingsby** is to be provided at a cost of £4556. The scheme supplies also the whole of the villages between that place and Malton as well as Butterwick and Brawby.

**Electric Lighting** is to be adopted for the town front at Rothesay, including the lighting of the harbour. The scheme is expected to cost a penny in the pound on the rates, and is estimated at £1800.

**Chichester City Council** have instructed their Surveyor to prepare plans for the consideration of an expert for the establishment of electric light works, with refuse destructor, for the lighting of the town by electricity.

**Electric Lighting in Glasgow.**—Glasgow Corporation Electricity Committee have agreed to recommend that the Corporation offer £30,000 for the buildings, plant, and rights of the Kelvin-side Electricity Company. The agents of that undertaking have stated £48,000 as the price at which they are willing to sell.

**Ipswich Railway Tunnel.**—It is stated that the Great Eastern Railway Company will most probably abandon their proposal of opening up the tunnel outside Ipswich Station, owing to the very great cost involved, and will possibly construct another tunnel alongside the present one, so as to have a double road through.

**Horsforth Waterworks Company** propose to construct for the improvement of their supply a storage reservoir in Burley-in-Wharfedale, by means of a curved embankment 445yds. in length. In connection with

this reservoir it is proposed to construct lines of aqueducts from Burley Moor. The cost of the works is estimated at £27,000.

**New Bridge across the Tyne.**—A joint meeting of the representatives of Newcastle and Gateshead Corporations was held last Monday week at Newcastle, to consider the engineers' report for the construction of a new bridge across the Tyne, between Newcastle and Gateshead. The report favoured a wider and heavier bridge than the one previously suggested. The report was adopted, and it was ordered that the estimates be printed and circulated amongst the members of a joint committee. It was also arranged that another meeting be held in the course of a month.

**A Distinguished French Engineer.**—The selection by the Institute of Civil Engineers of M. Picard, Commissioner General for the Paris Exhibition of 1900, as an honorary member, in succession to the well-known ironmaster the late M. Schneider, of Creusot, is stated by the Paris correspondent of the "Times" to have given great satisfaction in Paris. M. Picard, after a distinguished career at the Ecole Polytechnique, entered the Government service as an engineer, and is now Senior Inspector General of the Ponts et Chaussées, and also a member of the Conseil d'Etat, where he presides over the section which deals with engineering and industrial questions.

**The Great Nile Dam** at Assouan, of which the foundation stone was laid by the Duke of Connaught last Sunday week, is to be an unsubmergible masonry dam pierced with numerous under-slues. The dam will stretch across the Nile, with sluices and a long chain of locks, at a point where the river is nearly a mile in width. With the approaches, the length of the dam itself will be a mile and a quarter from side to side. The height of its coping-stone above the bed of the lower river will be 300ft. It will dam back the waters of a river which is a mile wide, which is 30ft. deep, and which flows at a high velocity, 66ft. above their present level. An enormous lake will thus be formed, and the stored up water will be thrown into already existing canals at a sufficiently high level to irrigate a vast tract of country. The work will cost about £2,000,000, but it will be cheap at the price if, as is estimated, it has the effect of increasing the productiveness of Egypt to the extent of £12,600,000 a year. Messrs. Aird and Co. are the contractors, and they have some 5000 men engaged on the work.

**Birmingham Engineers.**—The annual dinner of the Birmingham Association of Mechanical Engineers was held on the 11th inst. Mr. J. Powell Williams (Financial Secretary to the War Office), who presided, referred at length to recent engineering developments in relation to military matters. Mr. H. F. Donaldson in proposing "Prosperity to the Association," referred to machine-tools and labour-saving appliances. He was afraid there was no use blinking the fact that the Americans were ahead of us in this department, and he suggested that engineers should make themselves acquainted with what the Americans had done, and then go one better. Those who represented engineering firms in foreign countries needed to take a lesson from the Germans and be more ready to fulfil the requirements of their clients, and the manufacturers should send their productions in such a form as would appeal to the requirements and tastes of the countries for whom they were catering. That, together with the excellence of British manufactures, would still keep them at the head of the poll. With regard to tramways, he was told that in Birmingham the street cars were run by four different sorts of traction. Might he suggest that the horse was a very good thing, but it was not in its place in front of a tramcar. Then if they divided their energy they might be doing wrong. He would strongly urge that one power should be chosen, and that only should be used.

# Surveying and Sanitary Notes.

**Cromer Sanitation.**—At a meeting of the Cromer Urban Council last week, it was decided that the surveyor, in conjunction with Messrs. Cameron, and after consultation with Mr. Douglass, the engineer to the Protection Commissioners, should prepare the necessary plans for the Local Government Board in connection with the proposed septic tank system of sewage treatment.

**Sanitary Inspectors' Association.**—An influentially attended meeting was held in the Guildhall, Lincoln, to consider a proposal of the Sanitary Inspectors' Association to hold its annual conference in Lincoln during the coming summer. It was decided "that this meeting approves of the proposal of the Sanitary Inspectors' Association to hold their annual conference from the 3rd to the 5th of August, 1899, in this city, and will use its best efforts to make that conference a success." The conference is to be supplemented by an exhibition of modern appliances connected with sanitary science, in the Drill Hall.

**The Manchester and Salford Sanitary Association** held its annual meeting on February 13th, Dr. D. G. Leech presiding. The report showed that the Association has during the past year engaged in many forms of activity in the interests of the public health. It has urged upon the Manchester Corporation—hitherto without success—the desirability of establishing cottage baths; that is, that one or two cottages should be taken and fitted up with several baths for the use of women and children who would never visit large institutions. It has taken steps in the matter of the disposal of the town's sewage, and the abate-

ment of nuisances arising from chemical works and smoky chimneys, and has been active in urging the more effective treatment of consumptive patients by the erection of sanatoria, &c.

**London Water Supply.**—At the meeting on Feb. 13th of the Royal Commission appointed to inquire into the Metropolitan Water Supply, the Engineer to the Southwark and Vauxhall Water Company was examined. He said that complaints of the quantity or quality of the water supplied were very few indeed—practically one in every half million persons supplied. Their supply did not fall short last year. Sir A. Binnie's scheme of separating the County of Surrey from the County of London was based on an erroneous idea as to the capacity of certain mains. The carrying power of some of these would be lost to a great extent if Sir Alexander's scheme were carried out, as they would then be larger than was necessary. It would be impossible to separate the inlet works—at all events it would be much cheaper to reconstruct the works than to attempt to alter them. It would, however, be possible to separate the distribution plant between Surrey and London, but this could not be done in respect to the inlet works.

**Manchester Sewage.**—From the last report on the Davyhulme works, it appears that the first four weeks of 1899 established a record for the quantity of sewage flowing through the precipitation tanks. The first four weeks of last year showed a total flow of 548,000,000 gallons, whereas the quantity which passed through the works during the similar period this year reached the enormous figure of 1,003,547,000 gallons. During December last the Davyhulme works were called upon to deal with 912,123,000 gallons of sewage. The immensity of these quantities is accounted for by the heavy rains which were pre-

valent at the end of last year and the beginning of this. The general average of the sewage flow is only about 24 million gallons per day, whereas during the past month it has averaged nearly 36 million gallons. This unusual flow of liquids has created other difficulties at Davyhulme. The quantity of solids, cinders, &c., carried down by the storm water and deposited in the precipitation tanks is without any previous parallel.

**The L.C.C. Water Bills.**—At a recent meeting of the London County Council, Mr. Cornwall, Chairman of the Parliamentary Committee, replying to a number of questions, said that no objection had been raised to the Council's Water Purchase Bill, which would proceed to second reading in due course. As to the Welsh Reservoirs Bill, the Water Companies had sent a staff of officers to Wales to check the referencing of the Council, and had lodged about 700 objections to that referencing, most of which were of a very trifling nature. A few of the objections had been sustained by the examiner, who would report upon them to the Standing Orders Committee. In view of the large area of ground which the Council had had to cover, it was doubtless easy for the Water Companies to find small instances of non-compliance with the Standing Orders. It was generally admitted by the Water Companies or their representatives before the Examiner, that the case was entirely got up by the Water Companies, who had doubtless paid their witnesses for coming up to London. What these expenses amounted to he was not prepared to say. The witnesses were entirely under the charge of the officers of the Companies, and any of the Council's officers who approached them were at once brushed aside by the paid representatives of the Water Companies. The expenses incurred would unquestionably come indirectly out of the pockets of the consumers.

## COMPLETE LIST OF CONTRACTS OPEN.

## Property and Land Sales.

**ERMILE PARK**, near Cobham, Surrey.—A FREEHOLD BUILDING ESTATE of about 40 acres, with possession.

**MESSRS. DRIVER and CO.** have received instructions to offer to AUCTION at the MART, Tokenhouse-yard, Lothbury, NEXT SPRING (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairlie Station, and about a mile and a half from Cobham. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) offering charming views over the intervening country (from Downs); and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, the Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and be included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of **MESSES JUPP, Esq., Solicitor**, 48, Lime-street, E.C.; or of **Messrs. DRIVER and Co.**, 23, Pall Mall, S.W.

## PERIODICAL SALES.

ESTABLISHED 1843.

**MESSRS. H. E. FOSTER & CRANFIELD** (successors to Marsh, Miller, and Co.) conduct PERIODICAL SALES of

REVERSIONS (Absolute and Contingent), LIFE INTERESTS and ANNUITIES, LIFE POLICIES, Shares and Debentures, Mortgage Debts and Bonds, and Kindred Interests,

on the FIRST and THIRD THURSDAYS in each month throughout the year, at the MART, Tokenhouse-yard, E.C.

The following are the appointments fixed for 1899:—

1st	June 15th	October 5th
2nd	July 6th	October 19th
3rd	July 20th	November 2nd
4th	August 3rd	November 16th
5th	August 17th	December 7th
6th	September 7th	December 21st
7th	September 21st	

at the MART, Tokenhouse-yard, E.C. Telephone No. 999

**Order of Trustees.**—Preliminary Advertisement.—Reheold Building Estate, Streatham, near West End Road Railway Station.

**MESSRS. FIELD and SONS**, and **Messrs. WILFORD and WILSHIN**, who are jointly concerned, will SELL by AUCTION, at the MART, at early date, a valuable FREEHOLD BUILDING ESTATE, known as High View Park, comprising 16a. 0p., lying immediately at the rear of and with access from Leigham Court-road; also a contiguous Reheold Building Site of 2a. and 5p. in a new road intended to connect Canterbury-grove with Thurlby-

Particulars and plan, in due course, of **Messrs. KINGS-PORTMAN and Co.**, Solicitors, 23, Essex-street, and of **Messrs. WILFORD and WILSHIN**, Auctioneers, Anerley, S.E.; and of **Messrs. FIELD and SONS**, Agents.

and Syndicates, Building Societies, Capitalists, and others.

**VER.**—Important Freenold Building Estate of over 40 acres, with residence, known as Barrow Point, occupying a beautiful position close to the quaint old village of Pinner, within five minutes from the railway station on the Metropolitan line, and extending to an area of about 1 mile of Pinner Station on the London and North-Western Railway, having easy access from the West-end and City. The whole ripe for immediate building operations, and admirably adapted for villa residences of a superior class.

**MESSRS. FAREBROTHER, ELLIS, EGERTON, BREACH, GALSORTHY**, and others, beg to announce that the above valuable PROPERTY, which they recently offered for Sale by auction, may now be treated for privately. Apply to **Messrs. FAREBROTHER, 29, Fleet Street, Temple Bar**, and **18, Old Broad Street, E.C.**

**CONTRACTORS, CAPITALISTS, and OTHERS.**—Valuable Quarry, Light Railway, and Estate, situate in South Wales, to be sold as a whole. Further particulars apply to **J. W. DAVIDSON**, Esq., 6, Castle Street, Liverpool.

## An Architectural Causerie.

### On "Going to Nature."

It was lecture-night at the Arts and Crafts School.

The girls, with big pinafores nearly covering their gowns, and the men, in all manner of holland sacks and other workshop *déshabille*, came trooping into the architectural room with note books and portfolios, and arranged themselves, for the most part, separately on the men's or women's side of the gangway as if in church. A few invited guests filtered timidly in among the elect, and assumed a discipular air as became the occasion. It was a strange assembly of listeners; curiously un-English, one would have said ten years ago, before the arts and crafts spirit had penetrated even to the exceptional workman. But here at least is the exceptional workman—the unmistakable artisan still, though with a marked tendency to long hair and primitive eye-shades tied with string—learning in the same class with the architect, the draughtsman, and the business-like middle-class girl, whom fate has at length brought over from plaque and tambourine painting to the higher walks of decorative design. The lecturer was a popular teacher in the school; gifted, happily, with the power of conveying enthusiasm as well as knowledge, and having the rarer grace of inviting his pupils to laugh heartily at his own mistakes. It is not every art-master who would exhibit so frankly his school-day painting-book with its crude and laborious plant-studies from life, or tell the story of the yellow-centred auricula whose dusty pollen was "realised" by a layer of gum sprinkled over with the domestic flour-dredger! But while thus genially encouraging beginners with the records of his own misguided youth, Mr. Christopher Whall (for it was he), displayed at the same time such samples of patient industry in pencil-drawing, both from his own studies and from those of other students, as might chasten any budding hopes as to a primrose path to power. In addition to these drawings of natural forms, there was upon the walls an interesting collection of children's paintings, roughly portraying their own fancies without instruction from others, and illustrating to some extent that naive simplicity and lightness of touch of which the lecturer deplors the absence in modern art. The imaginative mind of youth, he said, likes to brood and dream over such fancies, which are indeed its most precious possession; and neither in individuals nor in nations can this instinct be thwarted with impunity. The natural love of the thing drawn can be easily unlearned in academies,

but they can never teach it. No less instructive was the record of the speaker's entrance at the age of sixteen into the classic shades of South Kensington, where, according to his brief but eloquent diary of that period, he "began school, and was put back from nature to curves." This entry became the text of some vigorous criticism of a system aiming at mechanical perfection of lines and curves apart from any intelligent knowledge or love of living things. Under this method the real beauty of the world was never put before the student as an object of study; the result was merely to turn out ready-made designers for the pottery firm or

proficiency could ever atone for. Going to nature in such a spirit, the trained eye would search keenly for every detail, every hint, that could be brought within its vision, and would know far more of the subject treated than would finally appear on paper. Study those artists, the speaker concluded, who make beauty their object, rather than those who make exact transcripts from nature, and know nothing of the selection of the poetic in their treatment of life. But perhaps the most memorable and suggestive portion of the lecture was the speaker's vivid impromptu descriptions of the flight of butterflies, their colours and habits, and their choice of ver-

Toledo

DRAWN BY F. HAMILTON JACKSON, R.E.A. (See p. 51.)

carpet factory of the day. In such a training the chief use of flowers was as "excellent things to make a design of." As a redeeming corrective to this process in his own case, he had fortunately come under the influence of the late Lord Leighton, who of all men in his own generation at the Academy schools had had the greatest enthusiasm for nature, and had always treated the human figure as if he so loved it as to desire to bring out, not its peculiarities, but its beauties; to seek for its poetic elements rather than to gain a striking effect. Only by direct, intimate, and enthusiastic study of natural forms, by entering with his own heart into the joy of living, could the student hope to retain that freshness of insight, that childlike buoyancy of imagination, the loss of which no technical

dure and atmosphere. With the aid of a handsome case of specimens, he introduced the audience to the "purple emperor," flying with the dignity of a falcon; the "red atalanta," flapping his wings in a suburban garden; and his small gregarious cousin passing like the flame of a candle over hyacinths in mid-May. Then the proprietor of the specimens, Mr. Selwyn Image, who was suddenly discovered at the back of the hall, had to be brought to his feet for a speech. This demand he answered by a ready offer to prepare a similar case of butterflies, named and mounted, as a gift to the school—a proposal which was, of course, received with enthusiasm. Amid such diversions the life of a London arts-and-crafts scholar need not lack reward. E. W.

## On Reflection.

### The Popular Error.

THOSE who have the cause of Art at heart desire most to see it dissociated from galleries and museums where at best it is among ill associations; they desire to see it no longer *exclusive* in application but pre-eminently *inclusive*, so that it shall be assimilated with the life of the people, and grace and idealise the humble contrivances round which the life and labour of the people is occupied; and to see it live in the utensils of kitchen and dairy. As Wordsworth said of Poetry, that it was the health and spirit of all knowledge, so may it be said more widely of Art, that it is the crowning privilege of peace and prosperity, even as it is the essence of education. At present the perception may be held hardly to exist. It is characteristic of the popular attitude towards those objects which are esteemed and acquired by the people as being beautiful, that they are not valued. Showy, tawdry furniture, decorations, and unending "ornaments" are bought, worn out, wantonly or carelessly broken, and thrown aside to make room for material for another stratum on the rubbish heap. It is thus apparent that the popular æsthetic sentiment is not a love of the beautiful extended to unworthy and debased objects, but a mere thoughtless, barbarous, jackdaw instinct, for acquiring bright, novel, and glittering things. An object which truly appeals to the taste, however cheap and easy of acquisition it may have been, establishes itself in the regard by process of years, and does not tire.

### Coming Memorials.

THE Committee entrusted with the work of organising and applying the subscription funds for the Gladstone and Millais memorials have now advanced so far with their respective projects as to have settled upon the practical forms the memorials shall take, and come to some conclusion upon the vexed question of sites. £27,500 has now been actually subscribed or promised towards the Gladstone Memorial Fund. It has been decided to chiefly apply this to the raising of monumental memorials in the capitals of Scotland, England, and Ireland. A sum of £8000 has been allocated to a memorial in London, and the site favoured is Gwydyr House Gardens, or Cambridge Green. It is proposed that Mr. Hamo Thornycroft, R.A., shall be offered the commission for this work. The amount allocated to the Edinburgh scheme is £6000; but no definite decision has been come to upon the subject of the memorial to be raised in Dublin. On the occasion of a late meeting of this General Committee, presided over by H.R.H. the Prince of Wales, the Duke of Westminster stated that sums varying from £1000 to one penny had been received in subscription to the fund from all parts of the United Kingdom. The popular enthusiasm for an adequate memorial to Sir John Millais seems hardly less remarkable. At a meeting—held by a curious coincidence on Mr. Ruskin's eightieth birthday—and presided over by the Prince, the happy omen of the occasion was well justified by the sum of £727 which was collected in the room. St. Paul's has been declared an impracticable site, and we think very rightly so; and it has been decided to place the statue on the principle flight of steps in front of the entrance portico of the National Gallery of British Art. Mr. Thomas Brock, R.A., is to be asked to undertake this work. We think the site is a most suitable one, as it is most apt in its associations. The statue will be distinguished by its site, and should confer distinction upon the building within whose precincts it is to stand. We hope that the design of all these

statues will attain to more than a mere illustration of the person and character of the subject. There are few statues in London, however pretentious and magnificent in purpose, that eulogise the person or the event to whose honour they are raised, or that decorate or distinguish the locality in which they are erected.

### An Acquisition.

IN Mr. J. F. Middlemore, who, introduced by Sir W. Walrond and Mr. Austin Chamberlain, took his seat in the House of Commons last week as a member for North Birmingham, the cause of Architecture and the arts has a worthy champion. Mr. Middlemore, though he has served as a member of the Birmingham Council for ten years, is better known as a philanthropist and patron of the fine arts than as a politician. His name is closely associated with the Museum and Art Gallery, of which Birmingham is justly proud; and only lately he crowned his previous beneficences by offering to present to the gallery his famous collection of paintings by Burne-Jones, Holman Hunt, and, in particular, G. F. Watts, of whose works he possesses some of the finest examples. But Mr. Middlemore's usefulness in this cause of popularising Art and of educating the public extends far beyond the influence of his gifts, munificent though they are. He has a sound understanding of the true significance and privileges of the Arts, and a great conviction and enthusiasm for his subject, and his popularity and municipal distinction in his native town have given him numbers of opportunities of inculcating these useful lessons, which an executant or a lecturer would be unable to find. As an instance of the direction of Mr. Middlemore's aims and aspirations in his favourite hobby, we may quote from a letter which some weeks ago appeared in the "Spectator" above his signature. "Who," he exclaims, "can measure the influence which St. Paul's Cathedral has on the tens of thousands who pass it every day; these cannot be unaffected by the dignity and graceful serenity with which it rears itself above the ignoble buildings which crowd and jostle each other about its base. It seems a perpetual summons to a less worldly and higher life than we lead.

For myself I have much hope for our Art future, chiefly because we are gradually becoming conscious of, and dissatisfied with, the ugliness of our lives, and we are beginning to look with questioning and critical eyes at every new building which is erected in our midst." We have no doubt that Mr. Middlemore in his now opening parliamentary career will serve well the interests of those who have the cause of the Arts at heart. We trust now that the future leader of the House will not be allowed without challenge to compare with a pickle factory the most entirely satisfactory building raised of late years; and that Mr. Middlemore will support Earl Wemyss' protest and secure that the design for the new Government buildings in Parliament Street shall satisfy a higher tribunal than the personal discretion of the Chief Commissioner of Works before they are sanctioned; and that this design shall be publicly exhibited, as has been a course frequently adopted in the case of other Government buildings.

**The New Infectious Diseases Hospital, Chester**, which is nearing completion is being erected from the plans and under the supervision of Mr. H. Beswick, county architect, Chester, the builder being Mr. W. W. Freeman. The whole of the wards are being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, Manchester grates, and Shorland's patent exhaust roof ventilators and inlets.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### LEAD BURNING.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR.—Could you inform me through the columns of your paper of any treatise on Lead Burning, or where I could get reliable information on the subject.—Yours &c.,  
High Wycombe. T. W. R.

There is a chapter devoted to Lead Burning in Mr. Hellyer's "Principles and Practice of Plumbing," one of the series of technological handbooks edited by Sir Trucman Wood and published by George Bell and Sons, York Street, Covent Garden, W.C. This book, the published price of which is 5s., would probably be of service to you.

### REPRODUCING DRAWINGS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I have been lately taking in the BUILDER'S JOURNAL and find it most interesting and instructive, and the beautiful illustrations give it an additional charm. It was very pleasing to see the new features in the last few numbers. Would you kindly give me some advice as to the reproduction of drawings. I am wanting to have some fine ink line drawings reproduced and do not know whether to have it done with "blocks." I rather lean to the photographic method myself though I am ignorant as to its limitations if any.—Yours truly,  
Catford, S.E. W. H. GODFREY.

The question whether line blocks or lithographs are preferable is to a great extent a matter of taste. For certain classes of work lithography gives the best results, but for such drawings as you mention line blocks are at least equally good, and they have the additional advantage of being considerably cheaper.

### MOISTURE DURING FROST.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have a cottage, the inside walls of which after frosts appear a little moist. Yet they are all lathed and strapped and painted instead of being papered, what can be the reason of that.—Yours, &c. FROST.  
Glasgow.

The moisture on the walls after or during frost may be nothing more than a natural phenomenon. Although ordinary paint is not absolutely non-porous, it may be considered to be so for all practical purposes, and, therefore, any idea of the moisture penetrating the outer walls and finding its way through the painted plastering may be at once set aside as beyond the bounds of probability, if not of possibility. It is extremely likely that the moisture is nothing more or less than aqueous vapour condensed from the air. When a thaw occurs after frost it is usually accompanied by a considerable rise in temperature, and the air is quickly submerged with moisture which rapidly condenses upon contact with any cold surface. A painted wall would be much colder than a wall covered with paper in the usual way; and upon condensation taking place upon the surface of the former—even if in equal degree with the latter—it would be more apparent to the senses than would that upon the papered wall by reason of the absorbent character of paper. The same phenomenon might occur during frost or cold weather upon the heated air of the room coming in contact with the cooler surface of the painted walls. This is of frequent occurrence in halls and places of worship when the ventilation is not quite what it might be, and it is not at all uncommon to find the painted walls of such buildings streaked and disfigured by the stains of tiny streams of the moisture of condensation.

Patio of a house  
Toledo

DRAWN BY F. HAMILTON JACKSON, R.B.A.

## SPAIN: Its Picturesque Cities and Monasteries.

### VII.—TOLEDO.

By F. HAMILTON JACKSON, R.B.A.

THE mountains of Toledo, with their associated ranges of hills, form the watershed between the valley of the Guadiana and the valley of the Tagus. Toledo itself lies some distance north of them, upon the latter river, and about two and three-quarter hours away from Madrid in a southerly direction. It is about 2400ft. above the level of the sea, and is almost surrounded by the Tagus, which here bursts through a rent or "Tajo" of the granite mountains, from which, perhaps, it takes its name (which in Spanish is "Tajo"), though other fanciful etymologies have been invented. The streets are narrow, winding, and ill-paved, and are also most intricate and confusing to the visitor, which qualities would, however, make the city easier to defend and add to their coolness in summer. I remember trying to take a friend to the Post Office after having been there once myself. Three times did we walk around the maze within which it was hidden before I succeeded in again finding the right way in. The houses are most of them massive in construction, built of stone, and the 350 years' dominion of the Moors has left many traces, among others in the universal patio, around which the rooms are grouped, which becomes a pleasant, airy room in summer under its awning. The town is now well supplied with water, as it was in Moorish times, when there was a water-wheel 135ft. high which forced water up pipes, supplying as much as 600,000 buckets daily, as late as 1568. Soon after this date the wheel was damaged by a flood, and was never repaired, and until a few years ago all water used had to be either collected in rain-water

tanks or carried up to the town on the backs of donkeys.

Toledo, the chosen city of the early annalists and antiquarians, claims to be the most ancient city in Spain. It has even been asserted that the sun first rose over it because it was the centre and throne of the world, and though this claim was made satirically, the language used by some of its sons when speaking of it is scarcely less exalted. "The crown of Spain, the light of the whole world, free from the time of the mighty Goths." So Padilla speaks, with a convenient failure of memory as regards the Moorish conquest. Some have ascribed its foundation to Jubal (who is frequently the founder of cities in Spain!), or to Hercules, the latter ascription being perhaps more likely, as it is merely a synonym for the Phœnicians. The derivation of the name seems to be either "Toledoth," the Hebrew "city of generations, or the Arabic "Attalah," "a place of look out," and Jews, if not Moors, have inhabited the city from time immemorial. One supposition is that the original settlement was much augmented by Jews, who fled from Jerusalem on its capture by Nebuchadnezzar, and it is certain that when taken by the Moors a large portion of its inhabitants were of that nationality. It was taken by Fulvius Nobilior in 193 B.C., and was then described as a small city in a strong situation. Coins of the Roman Republic have been found, bearing a figure of a horseman with lance in rest, and the word "Tole . . . ." Christianity was introduced into Toledo by St. Eugenius, a disciple and friend of St. Denis of France, and the list of its bishops begins to have some regularity from the time of the peace of Constantine, the city never ceasing to be a great ecclesiastical centre, and being chosen by the Spanish Church for the seat of its celebrated councils, which were really convocations and parliaments, the first of which was held in A.D. 400. The Gothic King Leovigild, who consolidated the monarchy, removed his court from Seville to Toledo, and his successor, Recaredo, who reigned in 586, established the Catholic faith over the hither-

to prevalent Arianism. Seventy or eighty years later, under Wamba, the city became very prosperous and important, and its wealth enormous. This king recovered from poison, given to him by Ervigius; but having been laid out for burial, clad in a monk's dress, was compelled to enter the cloister (for the cowl once put on cannot be taken off) thus leaving the kingdom to usurpation and confusion. The corruption of the Court of Witiza and the quarrels between the usurper and the rightful heirs were causes of the downfall of the monarchy, to which must be added the long-prepared revolt of the Jews, provoked by the intolerant and cruel decrees of Sisebuta and other Gothic Kings, which finally confiscated their property and made them slaves, driving them to revolt and to correspondence with their kinsmen in the north of Africa; which resulted in the appearance of Tarik before the walls of Toledo in 712 with a force largely composed of Jews, or of the descendants of those Yemenite tribes which three centuries before Solomon had embraced the Jewish religion and spread over Western Africa, becoming a portion of the Berbers. To this force the Jews opened the gates while the Gothic soldiery was celebrating a feast day. At first the conquerors treated the conquered with great tolerance, but when the rigid and exclusively Mohammedan Arabs arrived the tolerance turned to persecution. Cordova was made the capital of the Khalifate founded by Abdur-r-rahman, and the Jews and Mozarabs again began a series of revolts which paved the way to the recapture of the city by Alfonso the Sixth in 1085, who then took the title of Emperor.

The remains of Roman work are small. Near the church of Cristo de la Vega the plan of a circus can just be traced, and the church itself was the praetorian temple, converted into a church by Sisebuta in 621. In it were buried the tutelars of Toledo, St. Leocadia, and St. Ildefonso. The former, born in 306, was cast down from the rocks above by Dacian, and a chapel was raised on the site of her fall. In this many councils were held, during one of

PUERTO DEL SOL, TOLEDO.

which (held in 660) she appeared "clad in a mantilla," and informed the president, St. Ildefonso, that "her mistress lived through him." This referred to a work written in defence of the Virgin Mary, and the saintly author was so pleased that he borrowed King Recesvinthus's dagger wherewith to cut off a corner of her veil as memorial, quite in the modern fashion of securing relics! This corner was shown to Philip II. in 1587; at least, he was told that it was this fragment of the veil. A procès-verbal of the scene in the Council was drawn up (not till 775, alas!) by Cixile, Archbishop of Toledo. The church was the finest in the peninsula at that time, but most of the columns were afterwards removed either to Cardinal Mendoza's Hospital de la Cruz or to the trascore of the cathedral, and the apse is all that now remains, surrounded by external sunken round-headed arch work.

Below the Puente de San Martin are the piers of another older bridge. Above it, on the crest of the hill, are towers and ruined wall, which belonged to its defences. These are called the Palace of the Gothic Kings, and it is said that from this place Rodrigo, the last king of the Goths, saw Florinda bathing in a Moorish bath below, the end of which episode was the conquest by the Moors; but the "bath" called "La Cava" is really a Moorish alcoba or pavilion, with ogive and horse-shoe arched openings on its four sides, and not a bath at all. Near the Puerta del Sol is a little church called Cristo de la Luz, which was a mosque during the Moorish dominion, but which contains pillars and arches dating from earlier times. This earlier part consists of a square only 22ft. across, which is vaulted in nine compartments. The horse-shoe arches which support the walls from which the vaults spring themselves spring from the capitals of low columns scarcely the height of a man and having no bases. Above the arches and a string course the walls are pierced with five lobed open arcades, but in the central compartment the ajimez double-arched windows are cusped and supported by shafts. The apse is a later addition, and is built of brick and stone, and decorated externally with Moorish arcades. There is a charming old garden at the back of it where roses grow and blossom plenti-

fully, and where there is a picturesque water-tank under a pergola of vine. This is the mosque at which Alfonso VI. stopped, on his entry into Toledo, on Sunday, May 25, 1085. He had the first mass said by the Abbot D. Bernardo, the celebrated French Archbishop of Toledo, and his shield still hangs within it blazoned with a golden cross on a red ground. It derives its name from a legend that the Cid's horse was one day passing the church when it stopped and knelt reverently. The wall opposite being opened, an image of Christ was found within a niche, lighted up by the identical lamps, which had been placed there by the Goths several centuries before!

Close below Cristo de la Luz is the Puerta del Sol, the best preserved of the Moorish gateways. The lower arch is of the usual form, the walls being built of granite below, and of brick above, ornamented with intersecting arcades—a beautiful work. But one can understand, when looking at it, how easily the artillery of Ferdinand made the Moorish fortifications untenable. The old road wound down from hence to the gate, now blocked up, and therefore called Puerta Lodada, past the church of Santiago, which is a curious mixture of Moorish work and Renaissance imitation of antiquity. The present road bends to the right, and issues through the Puerta Visagra, a gate built in 1575 by Philip the Second, who adorned it with the eagle and shield of Charles the Fifth, and with statues by Berruguete. The road to the left, outside the walls, passes the old gateway—Lodada—which is a Moorish work of the ninth century, with slits for arrows above the great horse-shoe arch. Within this arch are two narrower ones, one of which leads to a very narrow winding passage, a frequent precaution observed by the Moors in fortified gateways. The name "Visagra" is the Arabic "Bib Sakra," "gate of the country," and the rich pastoral and cereal district between Illescas and Aranjuez (to which this road conducts) is still called La Sagra. This line of wall is the outer one, built for the most part by Alfonso the Sixth in 1109. It begins at the Alcántara Bridge, passing by a suburb, Las Covachuelas (which means secretaries of state) to the Puerta Visagra, and joining the old walls some little way farther on, near the

Hospital for Lunatics. The inner line is that of the Gothic fortifications of Wamba, which were accepted and strengthened by the Moors. Of this line the principal defensive works were the Castle of San Servando (an outwork on the other side of the Bridge of Alcántara, which was garrisoned by the Templars until the dissolution of the order in 1306) the Alcázar which crowns the hill above the bridge, and the bridges and gates themselves. The other ancient gate is the turreted Puerta del Cambron, rebuilt in 1576 when the old Gothic gate was pulled down. In the inside niche of this gate is a beautiful statue of St. Leocadia by Berruguete; below the figure is an inscription with a vain prayer that she may expel ennui, "Tedium," from Toledo!

Close by is the Puente St. Martin, a work of the fourteenth century, the main arch of which is 95ft. high and 140ft. across. It was originally built in 1212, and a legend says that the wife of the architect saved her husband's reputation by setting fire to the centre before its removal showed that the construction of the bridge was bad. However that may be, it had to be rebuilt by Archbishop Tenorio in 1390, having been broken down by Henry of Trastámara, and the towers are of that date, though Moorish in shape. There was an earlier bridge here, a Moorish work, built in the middle of the ninth century by the Khalif Mohammed, of which the foundations may still be seen rather further down the river. The other bridge, Alcántara, was built by Al Mansour in 997 to replace one of the eighth century. It was fortified in 1217 by Enrique the First, who erected the tower that leads to the city—very Moorish in appearance, by the way. An inundation occurred in 1258, after which it was largely repaired, if not rebuilt, by Alfonso the Learned. It is a fine work, very much like the Puente San Martin, except that it is more surprising, for its single arch leaps with one bound magnificently from one side of the river to the other. The gate away from the town was built by Philip the Second, a poor work, though containing a statue by Berruguete.

The other remains of Moorish style are the Synagogues of St. Maria la Blanca and El Tránsito, and several houses and church towers. The first stands within a rose garden facing the shop where the productions of the manufactory of arms are sold, and is in plan a basilica with five naves, divided by rows of octagonal pillars, which number thirty-two in all. The central nave is 60ft. high and 15ft. wide, the lateral ones 12ft. broad and from 40ft. to 50ft. high. The capitals show a Byzantine feeling in design mixed with the Moorish character. The spandrels of the arches are decorated with graceful arabesques, and above them rises the cusped wall arcade which separates the naves, above which again are stalactite archlets, which rest upon twin pillars. The roof is artesonado, with coupled beams, and the transition to it is by a very elaborate frieze; much of the ornamental detail is in plaster. In 1405 St. Vincent Ferrer's diatribes excited the neighbours to expel the Jews from this quarter, which was the greater Jewry, where the wealthiest Jews lived. Since that time the synagogue has been in succession church, penitentiary, barrack, military store, dancing hall, &c., and it is a marvel that anything remains! Quite near is El Tránsito, built in 1357 by Simon Levi, treasurer of Pedro the Cruel, who killed him three years after and confiscated his wealth. It is built of brick, and is very plain outside, but elaborately decorated, chiefly with plaster work, within. It is a nave without aisles, 76ft. long by 31½ft. wide and 44ft. high. On the western wall was the pulpit from which the Rabbis explained the law, the whole surface being covered with the richest ornamentation. On the side walls is a wide frieze of stuccoed vine leaves, with the arms of Leon and Castile, and stars and bosses, and above is an arcade of seven foiled arches, supported on half pillars; this runs right round the building. The roof is artesonado, and the building is lighted from the west end. Along the walls, close to the frieze, are Hebrew inscriptions, among which is one which praises the Castilian king.

In 1494 Isabella gave this building to the knights of Calatrava, and called it San Benito. The name "El Tránsito" came from a picture of the death of the Virgin which was formerly here. These buildings are now under the care of the government as historical monuments, and when I was in Toledo "El Tránsito" was being restored, and the east end could be seen, the altar put up when it was made into a church having been removed.

Around these synagogues extended narrow, winding streets, inhabited by the Toledan Jews. The greater Jewry was defended by a fortress garrisoned by them, and they were so numerous that when the Inquisition was established in 1478, no less than 17,000 offered to be "reconciled to the Church!" The Spanish Jews, Sephardim as they were called, were of a very high caste, and had many curious customs peculiar to themselves. The synagogues are now sur-

It is time that we came to the cathedral, the greatest wonder of Toledo, which contains one of the finest interiors in the world. The outside cannot be very well seen. From the Plaza del Ayuntamiento, in front of the western façade, a good view of that part may be had, which includes the one great tower which is finished; it was completed in 1535 by Cardinal Tavera. It rises 325ft. into the air, the thin spire, with which it ends, being encircled by a crown of iron rays near the top, and terminated by a colossal cross. This tower was commenced at the beginning of the fifteenth century, and the architects were Rodrigo Alfonso and Alvar Gonzalez. It is composed of three stories, the topmost of which is octagonal and surrounded with pinnacles, standing on a square base, and is so elaborate in its details as to look like a colossal filigree custodia. To the right rises Ximenez's Mozarabic chapel, with its Cupola and Gothic open work, while between

transept; that in the north is called the gate of the Clock, or of the Fair—from the clock tower here, and from a fair which is held just outside in the month of August. It dates from the fourteenth century, and on the jamb are certain enigmatical figures. The work is rather stiff and rude, but outside is a magnificent Gothic railing of the end of the fifteenth century from the hand of Maestro Paulo.

Within the cloister are two more doorways—that of St. Catharine, a very fine fourteenth century work, with a central pillar on which is a figure of the saint beneath a canopy; this supports a lintel, which bears coats of arms within octofoils supported by little angels, the tympanum above being filled with a painting of the Annunciation, and the carving a good deal gilded. The other, the Puerta de la Presentacion, also called "del Niño Perdido," from the usual legend of the child supposed to be sacrificed by the Jews, is an excellent

Church of Santiago  
Toledo.

DRAWN BY F. HAMILTON JACKSON, R.B.A.

rounded by deserted, tree-planted plazas, in place of the swarming streets of the days of Toledan prosperity. The house of Simon Levi was inhabited after his time by the mediæval necromancer, D. Enrique de Villena; it is now a ruin inhabited by paupers. The Casa de Mesa, the Taller del Moro, and Las Tornerias are the principal houses built in the Moorish manner. The first is the work of Christian artificers after the conquest, but the principal hall is covered with lace-like patterns in stucco, the roof is artesonado, and the window at the end of the room is Moorish in form though Gothic in detail. The others have much the same character. The Taller del Moro, by the bye, was used by the Chapter as a store-room and workshop, "Taller" meaning workshop; but there is a story that its name was due to the Moorish Governor of Huesca, a certain Ambron, having invited the refractory chiefs of Toledo to dinner at this house, and having greeted them on their arrival by means of an executioner, who sliced off their heads to the number of 400!

them are three elaborate portals. These are called respectively the gates of Pardon, of Hell and of Judgement—the last being also named "de los Escribanos," because the Guild of Notaries has the right of entering by this door once a year when the members go to take the oath before the high altar. Over it is an inscription recording the date of the taking of Granada, of the expulsion of the Jews, and of the completion of the cathedral. Save for this annual opening, the great gates remain closed except for Royal personages. The gate of the Lions, so called from the six lions holding shields which are seated upon the columns outside, between which the railings stretch, was wrought by Maestro Egas in 1466 in a white stone which hardens with time and looks much like marble. Like the western doorways, it consists of a deeply recessed Gothic arch, profusely moulded and decorated with rows of figures under elaborate canopies. It was badly restored and added to in 1776, and more bad sculpture has been added in modern times. This gateway is in the south

piece of plateresque sculpture, and was begun in 1565 and completed by 1600. The arch is 40ft. high and 20ft. broad, the statues, medallions, and reliefs are good, and above the keystone is an oval medallion representing the Presentation in the Temple.

The interior, which is 404ft. long by 204ft. broad, is divided into five naves; that of the centre is 116ft. high, and the vaults rest upon eighty-eight piers formed of groups of shafts varying from eight to sixteen, the capitals of which are of simple foliage. Between the rows of pointed arches the 750 stained glass windows shine. These are superb, and towards sunset especially glow like jewels. They are some of the earliest in Spain, but are mostly the work of foreigners, either Flemings or Frenchmen. Around the aisle of the apse runs a row of low, small arches, enclosing little rose windows which are particularly fine in colour (these are the earliest windows), and at each end of the transepts is a fine rose 20ft. across. There is also a large rose window 30ft. across at the west end. The vaulting

was for a long time without a roof, but it was found necessary to cover it with tiles.

The choir, which occupies the usual position in Spanish cathedrals, is 70ft. by 45ft., and contains a great deal of splendid sculpture and other decoration. The lower series of stalls, carved in walnut wood, was finished by Maestro Rodrigo in 1495. The style is florid Gothic, and in medallions are represented the sieges and captures of cities from the Moors by Ferdinand and Isabella. Being contemporary, the record of costumes, &c., is very valuable, apart from the artistic skill shown. The upper row dates from the sixteenth century, and is the work of the two Berruguete and Philip Vigarni, who undertook it after a long contest with other carvers, presided over by the Chapter. It was finished in 1543, the year in which Vigarni died. Berruguete's work is on the right of the Archbishop's throne, and Vigarni's on the left. The stalls are of walnut, the recesses in which they stand being made of alabaster, with jasper columns dividing them. Vigarni lies buried near his work. The reading desks of gilt metal with bas-reliefs of scriptural subjects, divided by female figures, are a masterpiece of Villalpando. The principal lectern consists of a sixteenth century eagle, upon a Gothic base made in Germany in 1425, a very fine work, with niches containing figures and flying buttresses projecting, the whole resting upon lions. There is generally a heap of choral books at its foot, with bosses and corners of silver and other metals in their bindings, which makes a picturesque group. These choral books are many of them finely illuminated, and date from the fifteenth century. There are two other smaller lecterns of gilt bronze with good reliefs and statuettes, the work of the Vergaras in the sixteenth century. The *reja* is from the hand of Cespedes. In the *trascoro* are to be seen many of the columns of coloured marble brought from St. Leocadia, and above the arches is a row of fourteenth century reliefs representing scenes from Old Testament history, a very unusual thing in Spain.

The *reja* of the *capilla mayor* is by Villalpando, and is made of copper, iron, and brass. It took ten years to make, being finished in 1548, and he received for it £4700—equal in modern money to £20,000. It is 46ft. wide by 21ft. high, and is considered a masterpiece. It was formerly gilt and silvered all over. The pulpits outside are also by Villalpando, and are made of bronze taken from the tomb of Alvaro de Luna, broken up in 1449 by order of Henry the Infante of Aragon. The *retablo* is of wood, painted and gilt, and was put up in 1500-4 for Cardinal Ximenes by twenty-seven artists! It is considered one of the finest in Spain. The place where it stands was the chapel "of the ancient kings," founded by King Sancho the brave as a burial chapel for the royal family, but in 1498 Cardinal Ximenes obtained from the King leave to enlarge the *capilla mayor*, and arches were erected around the high altar, railed in with gilt *rejas*, above which are elaborately decorated niches containing the ancient tombs and effigies. Here repose the Emperor Alfonso VII. and the Infante Don Pedro de Aguilar, Don Sancho el Bravo, and Don Sancho el Deseado, and several Infante archbishops who have no inscriptions or statues. The piers are decorated with panelling in coloured marbles and with a multitude of statues of kings, archbishops, saints, and angels (which are rather large faced, like our early English statues), and on the right is open work Gothic tracery of the period of the construction of the Cathedral. On the left is the tomb of Cardinal Mendoza—a very fine work in the plateresque style, as impressive as the great tombs to be seen in Italian churches and quite as well executed. In front of it are three ancient chairs which belonged to the Inquisitors, now used by the celebrant and his assistants. There are fine candelabra in front of the altar, some said to have been brought from Old St. Paul's, London.

It is impossible to go the round of a cathedral which is so full of beautiful and interesting things, and which contains no less than twenty-three chapels, closed in with excellent *rejas*, but a few of these must be mentioned. In the

chapel of Santiago, which was erected by the constable Alvaro de Luna in the richest flamboyant Gothic in 1442 as a burial place for his family, was the effigy which rose to a kneeling position when Mass was said; this was destroyed by the Infante of Aragon when he entered Toledo. The alabaster tombs now there were sculptured by Pablo Ortiz for his daughter Maria. Don Alvaro lies in armour and the robes of his order, his hands crossed over his breast. At the corner are knights of Santiago kneeling in prayer. At his feet is a helmet crowned with ivy and laurels, and close by is a kneeling page, which may be a portrait of the one who, "faithful unto death," accompanied his master to the scaffold at Valladolid in 1451. At the corners of his wife's mausoleum stand four Franciscan monks, and at her feet her lady-in-waiting is reading prayers over her mistress. In this chapel are other fine tombs and an elaborate *retablo*. Next is the chapel of the later Kings, built in 1374 by Enrique the Second, in front of the chapel of St. Ildefonso, but removed to its present site in the sixteenth century because it stood in the way of processions. It is a work of Covarrubias, and a very beautiful example of plateresque. Here rest, under gilded niches, Henry the Second and his wife Juana, 1379 and 1381, their son Juan the First and his wife Leonora, and Henry the Third and his wife Catherine (daughter of our John of Gaunt). Juan the Second, by whose orders this chapel was built, lies at Miraflores, but his statue kneels among his ancestors. In this chapel are also a suit of Moorish armour, said to have belonged to the Prince Abu Malek, and a standard taken at the battle of Salado in 1340.

On the other side of the detestable "traspasado" is the chapel of St. Ildefonso, who is said to have been such a favourite of the Virgin that she attended matins in the cathedral sitting in his seat, and at another time placed a chasuble on his shoulders, which they say they have still got at Oviedo. He was Primate of Toledo, and died in 617. The chapel is octagonal and Gothic in style; it contains a few good tombs. In the *Capilla de los Reyes Viejos* is a fine *reja* by Cespedes, and some pictures, said to be in oil, dated 1418, by a Toledan artist. The next chapel, that of St. Lucia, is very early, and contains sepulchral inscriptions of the thirteenth century.

The end of the transept, which contains the portal of the Lions, is a very fine piece of composition and execution in a curiously mixed Gothic and plateresque style. The niches, which contain tombs, and the tracery at the sides of the door are Gothic, and so is the central pillar, bearing a figure of the risen Christ, and the carving on the tympanum, which shows a genealogical tree of the Virgin in relief; but above is a plateresque piece of ornamented sculpture, with a coronation of the Virgin in a circular cartouche in the centre, flanked by two statues in niches divided by ornamental columns, carved by G. de Borgona (Vigarni). A frieze runs above these figures from wall to wall, crowned by the balustraded gallery of a fine organ, where the style reverts to late Gothic. The external doors are of bronze, and were made in the sixteenth century by Villalpando and Diaz de Corral; the internal were carved in wood by Aleas and Miguel Copin, and they cost 68,672 maravedis, a large sum in those days. They are most elaborately worked in low relief, with an incongruous mixture of children, centaurs, vases, battles, &c. At the left of the door is a simple little *reja* of good design.

The chapels in the nave which are most noteworthy are—that of St. Eugenia, which contains a beautiful tomb in the style of the Saracenic work of the thirteenth century, with an Arabic inscription, the tomb of the Toledan Alguazil Fernan Gudiol, who died in 1278; that of "La Antigua," with a group of the Virgin and Child within a deeply recessed Gothic niche, before which the banners of the Spaniards were blessed on the eve of any expedition against the Moors; and the "Capilla de la Virgen de Piedra," which is believed to stand on the site of the altar of the former cathedral, and the very spot upon which the Virgin alighted with the *casulla* for San Ildefonso. The chapel is about 10ft.

square, and rises in a lofty pyramid of Gothic tracery made of marble, and gilded. The *retablo* is of alabaster and gilt bronze, and is the work of the two Borgonas (Vigarnis), Covarrubias, and Almonacid. On the Epistle side is the sacred stone on which the Virgin alighted, encased in red marble and trailed off. The faithful adore it by kissing. The Mozarabic chapel at the west end is particularly interesting, as being the only place in which mass is now said in the ancient Gothic manner. When the Moors conquered Toledo they allowed the Christians to retain six churches, which still exist on the same sites. After the reconquest there was considerable strife between the partisans of the Gregorian mass and those of the ancient Gothic form, which finally resulted after five centuries of struggles, in the general use of the Gregorian form except in these six churches, and in this chapel, which was founded in 1504 by Cardinal Ximenes, perhaps as a hint to the papacy that Spanish prelates considered ancient Spanish rites and customs of great value. Since that time the use has been still further restricted to this one chapel. The ritual is very simple, there is no auricular confession, and many of the prayers and collects are familiar to Englishmen, having been adopted in our Prayer Book. There is nothing of great artistic interest in the chapel, except Juan Borgona's fresco of the Capture of Oran by Ximenes—not that it is particularly well painted, but it is interesting for details of costume and of the evolutions of troops. The winter chapter-house is entered from behind the high altar. It is a curious mixture of Renaissance and Moorish. The ceilings of both ante-room and chapter-house are richly artesonado, and the work of celebrated artificers. In the ante-room are some elaborately carved Renaissance wardrobes by a pupil of Berruguete, and the door is a fine piece of involved geometric sunk panelling in the Arab fashion. On the walls of the chapter-house are excellent frescoes, by Juan de Borgona, of the acts of the Virgin; these are quite Perugian in appearance. Below them are portraits of the primates which have been painted from life since the time of Ximenes, and include his portrait. In the *vestuario* are kept some very finely embroidered vestments and frontals, and close by is a florid Gothic silver-gilt *Custodia*, 9ft. high, and decorated with 260 statuettes, the masterpiece of Enrique de Arfe, 1524. The arch-episcopal cross planted at the Alhambra at the taking of that fortress is also here, and in the same rooms are the bones of the Gothic kings Wamba and Recesvinthus.

The cloisters were erected in 1389 by Archbishop Tenorio on the site of the Jews' market. One account says that he purchased the site from them, another that as they would not sell he stirred up the mob to burn the houses of the unbelievers, and then raised these beautiful cloisters in their place. The walls were painted in fresco in the style of Gaddi, with, among other things, groups of heretics burning. These frescoes no longer exist, having been effaced by order of the chapter; fortunately, as the cloister is below the level of the street the damp has caused the works to perish with which they were replaced. In the wall is inserted a slab which was found in 1581 while the foundations of St. Juan de la Penitencia were being dug; it bears a Gothic inscription recording the consecration of the earlier cathedral in the year 587. These cloisters are very finely proportioned, and the central garden, which is above the level of the ambulatories, is railed in with a fine seventeenth century railing. The upper story was finished by Cardinal Ximenes. Above the summer chapter-house is the chapter library. It is difficult to get permission to see its contents, but it is very rich in Hebrew, Greek, and Arabic MSS., and Italian early poetry. The printed books are mostly Italian, having been brought from Italy by Cardinal Lorenzana.

Alfonso the 6th guaranteed the old cathedral to the Moors in the same way as they had set aside the six Mozarabic churches for the Christians, allowing them still to use it as a mosque, but Bernado, the first archbishop, backed by the Queen Costanza—French like

himself—dispossessed the Moors on the night of October 25th, 1086, by destroying all traces of Moslem worship. The Alfaqui interceded for them with Alfonso, and procured their forgiveness, for which reason his statue was placed on one of the piers of the Capilla Mayor. The building was pulled down in 1226 by St. Ferdinand, who laid the foundation stone of the existing cathedral. The architect was Pedro Perez Diaz, who lies buried in the sacristy of the Capilla de los Doctores, near the Sagrario. He was one of the best architects of the century and died in 1285. It will be observed that all the architects' names recorded are Spaniards, Rodrigo, Alfonso, Alvar Gomez, Martin Sanchez, and Juan Guas, though Cean Bermudez enumerates 149 artists, many of them foreigners, who during six centuries were employed by the richest prelates in Spain to make this a temple worthy of the primacy, a dignity which was long held

BRADFORD CENTRAL FIRE  
BRIGADE STATION.

AN UNSATISFACTORY COMPETITION.

BEFORE discussing the merits of the designs submitted in this competition it will be well to place before our readers the heads of the conditions upon which designs were to be based. These were briefly, limit of cost £15,000, and the accommodation required consisted of engine house to accommodate five engines on the ground floor, with duty room; stabling for eight horses, harness room, store room, and washing shed. Recreation room and hay chamber on the first floor. Chief officer's house to contain sitting room

to contain on one floor a living room, three bedrooms, bathroom, w.c., and coal-place, staircases and balconies. Carriage entrance to yard, hose tower not less than 17 yards high, boiler and engine-house, mechanics' and blacksmiths' shop, joiners' shop, laundry, loose box and additional stabling for six horses. Conveniences in the yard for the use of men. The site is rectangular, 352ft. by 122ft., and has frontages to Nelson Street, Caledonia Street, and Duinen Street. The entire area of the site is sunk below the road levels from 8ft. to 10ft., and herein consisted the difficulty in dealing with it. The designs placed first by the sub-committee, empowered by the Corporation to consider the matter, consist of three distinct schemes, the plan published herewith and two alternative schemes. Only one report, however, was submitted, and one perspective

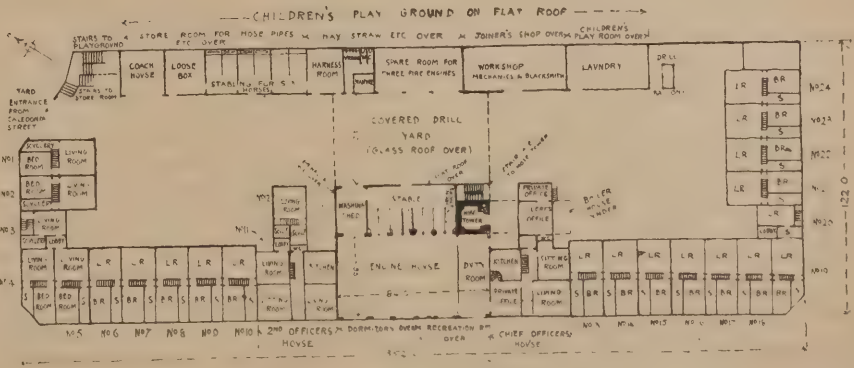

PROPOSED CENTRAL  
FIRE BRIGADE STATION.

by the master mind of the day. The chapter consisted of nearly 100 dignitaries and prebendaries. Here, as at Leon and Burgos, the Pope and the King of Spain were Canons, and the monarch was always fined 2000 maravedis for non-attendance *in coro* on the three days from Christmas to St. John the Evangelist. The cathedral was twice plundered, the first time by Padilla's mob in 1521, and again by General La Houssaye, the sacker of Escorial, in 1808.

(To be continued.)

The Lord Aberdare Statue at Cardiff is to be unveiled on March 2nd. The temporary site of the statue is in Howard Gardens, until the erection of the new buildings of the University College in Cathays Park. The New Church of St. Peter, South Tottenham, has just had its foundation stone laid. The new church, which is to be Early Gothic in style, will provide accommodation for 800 persons, and will cost about £8000. Admiralty Works at Chatham, already in progress, or about to be commenced, include the erection of extensive naval barracks, the building of a large naval hospital, the construction of new powder magazines, and the erection of a new gunnery school.

CITY OF BRADFORD CENTRAL FIRE BRIGADE STATION. ONE OF THE DESIGNS PLACED FIRST BY THE SUB-COMMITTEE.

living room, scullery, and conveniences in yard, office adjoining engine house, all on the ground floor with three bedrooms, bathroom, and w.c. on the chamber floor. Superintendent's house the same as chief officer, with the exception of the office, which was not required. Twenty-four dwellings in flats, with a flat roof for the childrens' playground, each dwelling

drawing. The committee appear to have been unable to come to any decision upon the relative merits of these three designs, and have apparently pitted them, combined, against all other competitors, which, to say the least, is decidedly unfair to the other men. We take no exception to any number of alternative plans, but we do say this: that when alternative plans are submitted for the entire

scheme, as in this instance, there should be a distinct set of drawings and report for each scheme, which should be distinguished by a different mark or number, and not form part of any other set of drawings.

The designs placed first are No. 38, and the authors are Messrs. Mawson and Hudson, of Bradford. They propose to fill in the entire site to the level of the roads with hard rubbish; the engine-house is placed in the centre of Nelson Street front, with stable, &c. adjoining at rear. The chief officer's and second officer's house are placed on either side, and the dwellings occupy the rest of the frontage on either side, and are returned along Caledonia and Duinen Streets. The workshops, laundry, and additional stabling are placed in a range of buildings at the back of site adjoining Bowling Beck. There appear many serious objections to this disposition of plan. To mention a few that occurred to us in looking at the scheme. The engine house, with stabling at rear, cuts into the middle of the yard, and divides what should be a fine drill ground into two portions, both of which are inadequate for fire brigade purposes. The drill ground at Belfast is 156ft. by 84ft.; here the largest clear area is 80ft. by 67ft. Superior designs in this respect are Nos. 18 and 40. The arrangement of engine house, duty room, stable, washing shed, and chief officer's house seems to be adapted from Belfast, and though this combination is the best piece of arrangement in the plan, it is placed in the wrong position on site; had it been at the Caledonia Street end, or even Duinen Street, it would not then have divided the dwellings into two portions, or made it necessary for the firemen's wives to cross what may be called the administrative part of yard to get to their laundry, or the children to cross the same to get to their playground. Again, the authors have placed the laundry adjoining the workshop, which is a bad arrangement; while to amuse the firemen's wives, when engaged in the pleasant occupation of washing their husband's linen, they have thoughtfully erected a drill balcony 70ft. high adjoining. In this scheme the dwellings are arranged, contrary to the conditions, in two-story through houses, with a staircase between the living room and the bedroom. The roofs of the firemen's dwellings were asked to be made a playground for their children, but the authors considered the smoke from the chimneys so deleterious to health that they preferred to let the children play on the top of the stables and manure heap adjoining the dye works! Four of the dwellings have only one bedroom each—viz., Nos. 3, 11, 12, and 20.

Over the engine-house is the recreation room, dormitory, kitchen, bath-rooms, and w.c., while on the flat over the stable is a urinal and w.c. An iron staircase from the flat runs up the exterior of the tower to a watch-room at the top, 94ft. high.

The first alternative plan is precisely similar to the last, and has the engine-house in the same position and arranged in a similar manner; it differs, however, in respect of the firemen's dwellings, which are arranged in flats.

The second alternative scheme is a variation in the plan of engine-house, which is, however, still in the same position on site; in it the engine-house is made 132ft. by 35ft., and the stalls for horses on duty, instead of being placed at the back of the engine-house, are placed on each side of the engine, "so that they are immediately adjoining their work, and are more separated in case of sickness or infectious disease." It is truly something new to learn that cattle are fit for fire work when they are afflicted with sickness or infectious disease! Yet, lo, "this is a very economical arrangement, and the latest improvement in the construction of fire brigade stations." Notwithstanding, to make up for the loss of space caused by the lengthened engine-house, the authors propose to place five firemen's dwellings on the second floor over the recreation room.

The authors cube out their building (though which design is by no means clear) at 870,258 cubic feet, which at 4d. per foot gives a price of £14,504; they, however, state that it can be executed for the amount

named, viz., £15,000. When we consider that it will take upwards of 12,000 yards of hard rubbish to make up the site to the road level, and that foundation walls up to that level have to be constructed before starting to provide any of the accommodation required, it appears still more mysterious that the committee should have selected a plan that is not only full of faults, but needlessly extravagant in its arrangement. Possibly it may have been the piano in the recreation room, which of course is included in the estimate, that tickled their fancy.

We should have stated that a very stringent clause in the conditions required all designs to be sent in anonymously, and "on no account must any distinguishing colour, mark or device, be placed on any of the drawings, description, statement, envelope or case by the competing architects or their agents." The authors of the selected design, unrestrained apparently by such a curb, blossomed forth into scrolly shaded titles, most curious and wonderful to see, and they called in their photographer to make them prints of their plans; these they pasted neatly in their report, and a photograph of the ground plan they pasted in a space round which the scrolly work clustered on their perspective drawing.

We have seen a few "cooked perspectives," but never do we recollect seeing a more misleading drawing than the one submitted by these gentlemen. It is a bird's-eye view of a sort to show more of the vertical walls than the roof, yet the drill yard appears from this to possess a width equal to if not greater than its length.

It must be recollected that the competitors have each spent at the least from one to two months in evolving a scheme for these buildings, they paid the Corporation of Bradford a deposit to be admitted to the competition, in many cases the original conditions were returned on account of unsatisfactory clauses, and upon their being amended, these competitors were asked to enter by the Corporation; they complied, expecting to receive merely justice. What is the result?

A selection is made by a sub-committee appointed to consider the matter; an exhibition of the designs is suddenly advertised in the local press; no notice is sent to competitors that any exhibition is being held or contemplated. The forty odd professional gentlemen who have spent their time and money in dealing with a difficult problem, are treated in the most cavalier manner, while a local firm rides rough shod over the conditions.

We trust that in view of the further competition for the Cartwright Memorial that the Bradford Corporation will see fit to re-open the exhibition of the designs submitted for this fire station, and appoint the professional assessor alluded to in their conditions to adjudicate upon the designs, and thus allay the unfavourable feeling which has been created in professional circles.

Our illustration of the perspective view is reproduced from the "Bradford Observer" by the courtesy of the editor. The plan is from a sketch made at the exhibition.

**An Epidemic Hospital** is proposed to be erected near Arbroath for the whole of the district. It appeared that there had been a proposal before the Carnoustie Local Authority to erect a cottage hospital for that burgh, and the matter has been adjourned for a month in order to give Carnoustie an opportunity of declaring whether it would go in with Arbroath and the county district in the hospital which the Burgh Public Health Committee have resolved to erect.

**Proposed Strand Improvement.**—A considerable street improvement will be effected in the Strand in connection with the development of the Duke of Norfolk's estate. It is intended to demolish the whole of the buildings between Arundel Street and Norfolk Street, these including the East Strand Post Office. In place of the condemned places of business will be erected a large block designed to provide accommodation for shops and offices. The post office will be given much more commodious premises.

## DESIGNS FOR MUNICIPAL OFFICES.

THE plans and elevations reproduced on one of our inset plates were submitted in a competition issued by the Urban District Council of Eastleigh.

The main building is entered from Leigh Road, and on the ground floor are shown—clerk's general and private offices, with strong room; collector's office, with room for safe; surveyor's office, with room for plans and samples; medical officer's room; cloak room and lavatory, and two w.c.'s, store, and stair leading to caretaker's house, with private entrance for caretaker from Romsey Road; and also a door communicating directly with yard and fire and stable offices. A stair from the yard leads to the heating chamber, under the medical officer's room.

On the upper floor are the council and committee rooms (which may be thrown into one large room by a broad door made to lift upwards); a ladies' retiring room with lavatory, a gentlemen's retiring room, cloak room and lavatory, also a store and a passage to caretaker's house.

The fire station and stable offices are entered from Romsey Road, and over the cart entrance and men's room are placed the caretakers' rooms.

The buildings were proposed to be constructed of brick throughout, but the doors and windows of elevations to Romsey and Leigh Roads were to have stone dressings. The roofs were to be slated. The floors of vestibule and lower hall were to be laid with mosaic, and the walls to have a dado of ornamental tiling. The floors and walls of cloak rooms, lavatories, and w.c.'s were to be tiled, the wood being of yellow pine.

The buildings are so planned that all the drains are well concentrated, all running into one main pipe going through the cart entrance. The pipes were to be of fireclay, suitable traps, inspection eyes, &c., being placed where required.

It was proposed to heat the building throughout by open fires, with the exception of the entrance and upper hall and council room, which would be treated by hot-water pipes. Incandescent gas burners were to be used for lighting. The cubical contents are 171,500ft., which, taken at the average price of 6d. per cubic foot for all the buildings, makes the cost £4285, and, allowing 5 per cent. for architect's fees, the total cost would amount to £4499 5s.

The buildings were so designed that they could easily be enlarged at any future time. The author is Mr. John G. Mitchell, of Edinburgh.

**A Bust of Mr. Gladstone** is to be placed in the debating hall of the Oxford Union Society. The work has been entrusted to Mr. E. Onslow Ford, R.A., and is to be paid for with the funds subscribed by past and present members of the society.

**The Coal Smoke Abatement Society** held a committee meeting last Tuesday week, at 6, Onslow Gardens, with Sir William Richmond in the chair. The Duke of Westminster, who expressed a wish that a younger man than himself might be found to accept the presidency, showed his practical sympathy by giving £100. The membership of the society is increasing rapidly, and the first public meeting will shortly be announced.

**A New Police-Station and Branch Library** is to be erected at the junction of Woodhouse Lane and Reservoir Street, Leeds. The new building will be set back to the line of the present railings on the side of the Moor. It will contain not only a police office, a branch free library, and news room, but also an inspector's room and a waiting-room for tramway passengers. At the junction of the two thoroughfares the building will be surmounted by a small tower, in which it is the intention of the Corporation to place a two-dial clock. The total cost of the scheme is estimated to amount to about £6000.

FOUNDATIONS FOR FACTORIES.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—There appears in your issue dated Feb. 15th, a report of a paper on "Factory Design," by Mr. J. H. Pearson. May I point out how misleading to the young engineers and architects to whom the paper was delivered are the writers remarks upon Foundations? He is reported to have said "where great weights had to be carried and the soil was of a soft nature it was desirable to employ a continuous and substantial bed of concrete over the whole site, in order to obtain a uniform pressure." (The italics are mine).

I wish to state that this is about the best way to obtain a very variable pressure on the soil and consequent unequal settlements and injury to the building, with the rare exception of a building possessing equal loads equally distributed over the area of the site. There is no soil that will not subside more or less under pressure, and this it will often continue to do over a considerable length of time depending upon the constructive character of the soil. I am at the present moment undertaking some experiment upon a certain site to determine its bearing capacity and this continual subsidence is a striking feature. Every structure therefore sinks somewhat into the soil, usually however, ceasing to subside a short time after being fully loaded. No precaution that can be taken will prevent this; our efforts must therefore be directed towards obtaining a perfectly uniform subsidence, and it will then be of little importance whether the building sinks an eighth of an inch or an eighth of a yard.

It is due to Mr. Pearson to say that I am aware that he is not alone in his belief in the efficacy of continuous slabs of concrete over the whole site—"floating" the building as the advocates of this method are sometimes pleased to term it. Additional bearing area provided in the foundations without regard to the amount and position of the loads—and that is what a whole-site foundation means—is not only no help to the support, but a positive source of danger. Pressure on foundations must be considered as an upward reaction as well as a downward pressure. In the appended

FIG. 1.

sketch (Fig. 1) I assume that the ground has capacity of resistance equal to 2 tons per sq. foot. It is obvious that the upward resistance at A cannot so effectually meet load A as that at B can meet load B; the foundations, therefore, cannot remain in stable equilibrium, and the whole superstructure will tilt over towards A. Again, if the distance between A and B be considerable then the slab of concrete may be expected to belly-up and rupture between A and B by reason of the action from below. It is simply a case of an inverted loaded beam.

Whatever the soil, soft or hard, there is only one safe method, viz., to proportion the area of the foundations exactly to the load to be carried, and to place the centre of pressure of each part in the centre of its bearing area. Columns and piers naturally divide up and separate the bearing areas—the centre of the column being the centre of the area—but with regard to irregular masses of superstructure, the centre of gravity of each mass should be over the centre of its bearing area, while with continuous walls, the width of the trenches

should vary in exact proportion, not to the thickness of the wall but to the load thereon. For example: It is found that the safe bearing area of the site of a factory is  $1\frac{1}{2}$  tons

FIG. 2.

per foot super. In Fig. 2, column A carries 150 tons. Then we have  $\frac{150}{100} = 100$ ft. super, as the bearing area for A, say 10ft. by 10ft. B, an intermediate column, takes only 25 tons and requires a base of 17ft. super, say 4ft. 2in. by 4ft. 2in. C is a brick pier in a line of arched openings in a wall, and takes 30 tons; so a foundation block, 4ft. by 5ft. is a suitable size. The last illustration of walls and piers requires an extra word. If the wall is of equal height or the load otherwise uniform, then inverted arches could be used under the openings, and a continuous trench and foundations could be employed, which, in case of considerable weights,

of about 11,000 square feet, and the structure and its stock when complete weigh together approximately 15,000 tons. A bed of Portland cement concrete, 3ft. thick, was spread over the whole surface of the site just above the water level, the bottom being of running sand. The building has been up nearly five years, and there has not been the sign of a settlement in the structure or its foundations, which I ascribe entirely to the continuous bed of concrete.

It will be observed that the weight above named approximates closely to the  $1\frac{1}{2}$  tons to the square foot given by J. D. in his example and diagrams No. 2. The weights upon the

FIG. 3.

would help to narrow the trench (giving room for machine bases and what not—often of great importance) without detriment to the structure. But if there are causes combining to produce unequal loads along the wall, then each bearing should be separate, and it is every bit as important to contract the bearing area of the lighter loaded piers, as to provide sufficient area for the heavier loaded piers. Fig. 3 is the plan of an arcade of equal-sized but irregularly loaded piers, showing how the

floors of the building I have alluded to necessarily vary considerably owing to the shifting of the stock (bales of compressed paper). At times as much as 150 tons have to be sustained by a single basement column, whilst an adjacent one may at the same instant have only half that load to carry.

In these circumstances one would expect the slab of concrete, if J. D.'s theory were tenable, to "belly up" and "rupture" between the bases of the iron columns. As before mentioned this disastrous result has not occurred. At the present time I am concerned in the erection of a larger building than the foregoing, and where heavier loads have to be carried. The continuous bed of concrete has been adopted for the foundations with equal success.

Without further traversing J. D.'s letter, I hope the instances I have given, based upon practice, will prove to him that his theoretical deductions obtained by experiments are inaccurate.—Yours truly, J. H. PEARSON.

32, Finsbury Pavement, E.C.

FIG. 4.

formation blocks may be varied. In the case of equal loads equally spaced, they should be treated as separate loads and their proper area discovered; then if these areas approximately reach one another, there can be no harm in their being joined up in one slab (see Fig. 4).

J. D.

Balham, S.W.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I had satisfaction in reading in your issue of the 22nd inst. a letter from a correspondent whose views accorded with mine in that part of my paper upon "Factory Design" referring to the "relationship between architect and engineer." May I say that I am pleased to observe that the interest in my paper is sustained by a letter from J. D. in your columns of this week, although my remarks upon "Foundations" have evoked his adverse criticism. I am glad to have the earliest opportunity of replying, and can only say that the theoretical deductions of J. D. are not from my experience borne out in practice.

In advocating the desirability of employing a continuous and substantial bed of concrete over the whole site of a building where the soil is of a soft nature, in order to obtain uniform pressure, I illustrated fully by drawings and diagrams at the meeting a building combining warehouse and factory, in the erection of which I was professionally concerned, where this plan

BRADFORD FIRE STATION COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I note your remarks in last week's issue of THE BUILDERS' JOURNAL re Fire Brigade Station Competition at Bradford.

I was one of the competitors who sent in drawings in response to the invitations issued by the Bradford Town Council. Up to the present I have not received any official intimation as to the result of the above competition, and have had to rely on the notices given in the local press.

I went on Saturday week to Bradford, to inspect the forty-four sets of drawings on view at the Free Library. Like your correspondent, I was unable to discover which of the three alternative sets of drawings sent in by the winning competitors was selected for the first premium. In the printed particulars issued by the Corporation to the competitors, "Condition" No. 12 states that: "The walls on plans and sections are to be shown in black; the elevation and perspective must not be coloured, but finished in Indian ink." Yet in the face of this condition, I find that all three

of the premiated sets of Drawings are coloured. Further, in "Condition" No. 17, it is stated that: "any design, the preparation of which does not comply with the foregoing conditions will be rejected."

Any further comment upon this is needless. To say the least, it is most unfair to other competitors who have, like myself, adhered to the conditions laid down. There are also other details shown on the winning set of designs at variance with the conditions.

In the meantime I should feel obliged by being placed in communication with other competitors who may feel, along with myself, aggrieved at the injustice done towards us with respect to this competition.—Yours respectfully,  
GEO. HEPWORTH.

## Views and Reviews.

### "TIMBER."

The special annual issue of "Timber and Wood-working Machinery" contains in an attractive form a vast amount of information likely to be useful to all dealers in timber and users of wood-working machinery. Among the more notable contents may be mentioned: "The Timber Docks of London," by E. Vize-telly and W. L. Bird; "The Export Trade of the North Pacific Coast of America," by Frank B. Cole; "Kew Gardens and the Timber Trade," by Edwin Collins; "Sea-going Rafts on the Pacific," by Edward K. Bishop. All these subjects and many others are dealt with in a capable manner by the various writers, and the illustrations are often of exceptional excellence. But perhaps nothing in the book is more worthy of general attention than Mr. J. Stafford Ransome's forcible plea for the maintenance of the prestige of British machinery. He points out that of late years strenuous efforts have been made by German makers to push their trade in Great Britain, and this has led British makers to endeavour to compete in price with them. "This," says Mr. Ransome, "unquestionably is legitimate enough, but it is rather a mistaken policy on our part, for if one competes in price with such people one must assuredly compete for the record of inferiority too. Our extremely large trade has hitherto been due solely to the fact that people generally have had confidence that in buying their machines from English makers, they were sure to have the best which were procurable. This feeling every British manufacturer should endeavour to keep going and to stimulate. For awhile our cheap machines do not materially affect our prestige in our home trade, where all the purchasers of wood-working machinery know the various firms who make it, and can buy a good machine if they want to, or an inferior one if it suits their pocket better to do so. But that some of our makers should sink the quality of their machinery to the level of that of some of their Continental competitors is not only humiliating as a policy, but is likely, unless checked, to have most disastrous effects with regard to the good name of British wood-working machinery abroad."

"Timber and Wood Working Machinery." Special Illustrated Issue, 1899. The Boleph Press, Limited, 1s.

### THE DUTCH GALLERY.

At the Dutch Gallery, 14, Brook Street, Hanover Square, is to be seen an interesting collection of designs, interesting because they are (with the exception of three) the work of a master and his pupil, and have therefore an affinity in style unusual in an exhibition room, while showing the difference due to the individuality of the two designers. They are mostly designs for fountains or for portions of them, and are the work of Mons. A. Legros, once Slade professor, and the Countess Feodora Gleichen. *Place aux dames!* We will speak first of the lady's work. Of her contributions the best is perhaps a small circular relief called "Venite adoremus," which shows three little angels adoring the infant Christ (who has an enormous nimbus by the bye). The composition fills the space

quite prettily, the lines of the wings and the posing and grouping of the figures being harmonious. The model for a well, to be executed in stone or bronze and wrought iron has a pretty motif of graceful crouching figures at the angles of a well-head, shaped like the capital of a column; but the other details are conceived on the scale of the model, and not on that proposed for execution, and if ever carried out on that scale would prove disappointing and heavy. The projects for fountains are not sufficiently architectonic, or not spontaneous enough. The very free form of design adopted requires for success equal freedom and apparent fortuitousness in arrangement, and these drawings are too evidently put together, a defect from which the master's work also is not always altogether free. On the other hand, the design for a sundial, with the three fates separated by sweeping scrolls upon a triangular base, is distinctly impressive, and an unnumbered drawing of a hollow sundial shows a pretty group of children supporting it, and amorini racing hand in hand around the base, suggesting the sunny hours passing rapidly, an ingenious idea. The children playing with the water in the large fountain in which master and pupil have collaborated are also nicely posed, and the Countess Gleichen shows considerable fancy in her work throughout. Why this fountain should have the ugly square head which finishes it above M. Legros' strongly modelled mask one does not understand, but the defect of most of the designs is the lack of appreciation of the architectural setting necessary. The mouldings are generally such as one would expect from a painter, and one might suggest that the assistance or counsel of an architect would sometimes be of advantage.

Of M. Legros' designs the most charming is a pencil drawing, numbered 27, a design for a fountain, showing a very broadly spreading basin, below the rim of which the water escapes from the mouths of satyr masks whose horns are pulled by children appearing above curling waves between each couple, the whole forming a band of sculptured ornament surrounding the basin. These great satyr masks seem to have a fascination for M. Legros, and the collection contains seven designs for them, as well as two executed in high relief (one, a portion of the fountain which he is making for Welbeck Abbey) while one foundation is decorated entirely with them in a quite unconnected way. One is always glad to see M. Legros' masterly studies of heads in chalk or silver point, and the present exhibition contains several of the highest excellence. The drawings numbered 2, 3, and 6, are unsurpassable for the delicacy of their modelling and the beauty of the technique, especially around the eyes and nose. Here, too, is the female torso in bronze, of which a cast stands opposite the refreshment room at South Kensington, a work of great beauty and distinction.

Mr. Lanteri shows a cleverly planned and modelled sketch for a fountain, which, while very accomplished as craftsmanship, shows a lack of sympathy in design between the laxity of curve of the central group and the architectural forms of the basin and base below.

In the gallery are also some proof woodcuts of the modern artist wood engravers, which are interesting, and a few drawing of excellence by Phil May, Meissonier &c.; and as one leaves one's eye is caught by an astonishing piece of realism by Ph. Rongean—an oil painting on a panel of a bunch of asparagus against a dark background—nothing more—but the colour and texture are nature itself and the technique simple and masterly. A. W.

**Illuminating the Embankment.**—Steps are to be taken almost immediately to light the Victoria Embankment and Westminster Bridge by electricity. Tenders have been sent in for the engines and dynamos to work the installation, and plans for the generating station are in course of preparation. The amount sanctioned for the work is £25,300, but it is expected to cost a good deal more before the lighting is complete.

## Keystones.

**Rebuilding of the Old Bailey.**—The city surveyor (Mr. A. Murray) and Professor Aitchison (the President of the Royal Institute of British Architects), are engaged in preparing the instructions to the six competing architects who will be asked to submit plans for a new Sessions House in the Old Bailey. The new building will probably cost over £150,000 to erect.

**Pictures at St. Paul's.**—Just now, when the decoration of St. Paul's Cathedral is being actively carried out, a letter written by Sir Joshua Reynolds, which will shortly be put up to auction in London, is of special interest. "I fear," he writes, under date October 16th, 1773, "our scheme of ornamenting St. Paul's with pictures is at an end. I have heard that it is disapproved of by the Archbishop of Canterbury and the Bishop of London." For the sake of the advantage that would accrue to the arts by establishing a fashion of having pictures in churches, six painters agreed to give each of them a picture to St. Paul's. The pictures were to be placed in that part of the building which supports the cupola, which was intended by Sir Christopher Wren to be ornamented with pictures or bas-reliefs, as appears from his drawings.

**A New Technical Institute for Shoreditch.**—Within a few months a technical institute, that is better adapted than the present school in Hoxton Street, will be opened in Shoreditch. The building is Ask's School in Pitfield Street, which was taken over by the London County Council some time ago. The present structure affords ample accommodation in the way of class-rooms, workshops, and lecture-halls. The first-named have, however, been enlarged, and other extensive structural alterations have been made since the building was vacated by the boys in the summer of last year. Electric light is to be installed throughout the school, and when this work is completed many of the apartments will be ready for the fittings. Among the subjects which will be taught at the institute are drawing, wood-carving, clay modelling, cabinet-making and joinery, dressmaking, electrical fitting, and plumbing.

**A Parish Home for Peterhead** is shortly to be erected, and the following tenders have been accepted: Mason, William Stuart and Son; carpenter, W. B. Taylor; plumber, John Ferguson; slater, Mackintosh and Cannon; plasterer, William Shand; painter and glazier, Alexander Ferguson; amounting in all to £2929 6s. 6d. Provision is to be made in the new homes for thirty-two beds, in place of twenty-five in the present building, while in addition there will be suitable accommodation for aged couples, and wards for treating the sick. The building is to be two stories high, with projecting wings at either side and in the centre, and a back wing of one story. The centre length of frontage will be 103ft., the depth of the main building 30ft., inside wings 55ft. each, and the ground space of the centre and back wings about 70ft.

**The March Number of the Architectural Review** will contain an authoritative article by Sir Reginald D. Balgrave, on the site of the scaffold upon which King Charles the First was executed, with an interesting illustration of the Banqueting Hall in Whitehall. Sir Reginald Balgrave is in a position to write upon this matter, having made a very careful study of the subject. Other interesting articles will be: The Chapel of St. Peter the Martyr in the Chapel of St. Eustorgio, Milan, by Alfredo Melani, fully illustrated from photographs procured on the spot; an account of the restoration of Lake House, near Aylesbury, with illustration showing the scaffolding and the method employed to make good the ravages of time and weather; the letterpress is written by G. Ll. Morris; Mr. H. Wilson writes upon "Drawing," with illustrations from the studio of John D. Sedding; and the Rev. W. J. Lofti contributes a further number of the series of Arts in Ancient Egypt.

# Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

March 1st, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

No. 3 of "Specification," which has just been published, is far and away the best number that has yet appeared. It is double the size of previous issues, containing 628 pages and about a hundred illustrations. But the bulk of the work is among the least of its recommendations. The greatest possible pains have been taken to render the information given absolutely reliable; the work of the hundred contributors who have been engaged has been carefully checked by a large staff of specialists of the highest eminence in their respective spheres. As the information is arranged in an attractive and convenient form, the publication forms a work of reference of the utmost value to all architects and builders.

**The London Government Bill.** AMONG the provisions of the London Government Bill, introduced last Thursday by Mr. Balfour, are several which somewhat intimately affect the building trades. It is proposed to transfer to the local municipalities that are to be established certain powers that have hitherto been vested in the County Council. The new municipalities will have the sole right to make orders in respect of subsoils or foundations for buildings, the construction, repair, alteration, and level of buildings; they will make bye-laws regulating offensive businesses, the structure of premises, and other matters; they will have power to promote bills for local street improvements; they will have the care of the smaller open spaces, and upon them will devolve such duties as the inspection of slaughter houses under L.C.C. bye-laws. The Bill also makes provision for the devolution of further powers in the future by agreement with the County Council.

**The Decorators' Institute.** AN Institute has just been incorporated for those engaged in the Art and business of painted decoration. The objects of the new Institute are similar to those for which Institutes of Engineers, of Architects, and of Surveyors have been formed. The idea seems to have originated within the present decade, and to have taken more definite shape at a meeting of the "National Association of Master Painters" at Manchester in 1894. Endeavours were made to obtain a charter last year but, objections being raised, it was decided to incorporate the Institute under the non-trading clauses of the Limited Companies Act; and, after some years of persevering effort the Institute was finally registered as incorporated on January 21st this year. The first meeting of the Provisional Council since incorporation was held at Painters' Hall on February 8th. This Council consisting of twenty-five members is representative of England and Wales, Scotland and Ireland,

Mr. Crace of London being President. The council at once proceeded to elect officers and arrange for the organisation and working of the Institute. Mr. W. H. Pitman was elected treasurer, Mr. G. Petter, auditor, and Mr. F. W. Englefield (of Messrs. Pritchard, Englefield, and Co., Solicitors), secretary. The first general meeting is appointed for March 23 at Painters' Hall, Little Trinity Lane, where the new Institute's headquarters will for the present be situate. In noticing the definite formation of this Institute, it is only just to say that, although it will have its headquarters in London, its origin and its preliminary organisation are almost entirely due to the initiative and the persevering efforts of representatives of the northern counties, and particularly also of Scotland, where Mr. Thomas Bonnar, of Edinburgh, and Colonel Bennett of Glasgow, have been its constant and energetic supporters. Most valuable of all, however, have been the indefatigable services of the interim secretary, Mr. W. B. Crawford, of Glasgow, to whom no trouble or difficulty seemed deterrent, and no labour superfluous.

**Art and the Funeral Cortege.** It is the custom at Venice, so we are informed by Professor Melani, for each friend of the defunct to send a torch each to the funeral. It is then easy to see that the worth and the celebrity of the deceased are measured by the number of torches sent, in fact, in some cases this number mounts up to two or three hundred. It is easy to imagine the effect of all these torches when carried into the church—as they usually are—where they poison the atmosphere with the dense smoke, and soil and tarnish the objects of Art, the plate, stuffs and furniture, &c. This state of affairs arrived at such a pitch that at a recent synod held at St. Mark's it was decided to forbid henceforth the entrance into the church of the torches which accompany the deceased.

**What is an Architect?** It would appear that an architect must on occasion be prepared to keep a sea-side lodging house. The following advertisement appeared in the "Times" last week: "Architect's assistant wanted, at the seaside. Must be a married man, and fully qualified to design and complete without supervision, working drawings, specifications, and level and survey. Furnished residence with good garden provided. Salary £2 10s. per week, which wife could supplement if desired by catering for paying guests. Address, stating previous experience, age, and qualifications, to X. 924, 'The Times' Office, E.C." No doubt there will be rush of "fully qualified" architects to secure this prize. Think of the paying guests!

**Sir E. Poynter's New Panel.** A mosaic from the design of Sir Edward Poynter, P.R.A., has just been fixed in the central hall of the Houses of Parliament, over the entrance to the corridor leading to the Commons Lobby. The panel was executed by the Venice and Murano Glass Company Limited, of St. James's Street. It represents St. David, supported on either side by allegorical figures. On the left of the spectator is the Spirit of Ancient Welsh Poetry, represented by a female form clothed in a blue garment with a green mantle, and in her head a crown of oak leaves. The figure of Religion or Theology on the right is draped in purple and grey; in her left hand is a burning lamp and in her right a book. St. David, arrayed in full pontificals, is in the act of preaching. His right hand is raised and his left holds a small book. The ample chasuble is of rich amber shaded with gold, forming a pleasing contrast with the white under-vestments. The border underneath the picture shows the Welsh emblem, the leek, and also the quarterings of the Welsh principality. In the centre is the inscription "St. David for Wales." Welsh members were complaining not long since of the neglect of Welsh interests by the Government, and the House of Commons generally. Is this artistic glorification of the Principality designed to make amends for past neglect?

## The New Government Buildings.

THE Earl of Wemyss, in a letter to the "Times," points out, with reference to the new Government Buildings to be erected in Parliament Street, how fine an opportunity is now afforded for beautifying the metropolis with noble Architecture, and he suggests that before the designs are finally settled and approved they should be exhibited in public, so that all who take an interest in London Architecture may have an opportunity of seeing and criticising the selected design. It appears that under Mr. Layard's rule at the Office of Works a model was made of all that district of London where Government public buildings existed or were likely to be built; all the houses, &c., were made removable, so that any intended public building could be placed *in situ* and judged as to its general effect and how far it harmonised with its surroundings. The Earl of Wemyss suggests that this model should be produced, and that models of the proposed buildings should be made and tested *in situ*.

## Cottage Workhouses.

It is not likely that architects will in future be called upon to design, or builders to erect, many more workhouses or industrial schools of the barrack type. The trend of public opinion is strongly in the direction of housing the pauper population, both children and adults, in cottage homes rather than in these great institutions. Mr. Hutton's bill, which has for its object the provision of cottage homes for the aged poor, passed its second reading in the House of Commons last week, and although the measure will have to be extensively altered in Committee if it is to be made workable, the House is committed to the principle of the thing. The Lambeth guardians, at their meeting last Wednesday, had under consideration a report of a special committee recommending the erection of cottage homes at Norwood for 100 aged and deserving indoor poor. This was suggested as an alternative to the enlargement of the workhouse, which would otherwise be necessary. The consideration of the matter was adjourned for a month.

## The Compensation Act.

THE Workmen's Compensation Act does not seem to be working so smoothly and satisfactorily as could be desired. At Sheffield County Court last week Judge Waddy said he entertained a strong view that the Act was doing damage instead of good to the unfortunate workman. The Act seemed almost to consist of exceptions. Two prominent advocates had said that two out of three accidents which came before them were exempted from the Act. Another recent commentator on the Act is Sir Wilfrid Lawson. His comment is as follows: "If you fall thirty feet slap bang on the street, You'll get cash if your head be split; But if, cutting it fine, you fall just twenty-nine, In that case you won't get a bit. So the moral is this, if I'm not far amiss, If you are a wise working man, If you find you've a call to accomplish a fall, Then tumble as far as you can."

## For Industrial Peace.

MR. RITCHIE has submitted to the Employers' Parliamentary Committee and the Parliamentary Committee of the Trade Union Congress his proposals for the avoidance of trade disputes. Mr. Ritchie does not advocate compulsion. He desires to see established in every trade that which already exists in several, viz., a conciliation board consisting of employers and employed, to whom, in the first instance, every dispute should be referred. Failing agreement at this tribunal, the dispute should then go before a central conciliation board, composed of employers and employed, representing all the trades. Until a final pronouncement is made by the central board there should be no strike or lockout. The proposals seem eminently reasonable. The present dispute in the building trade would almost certainly have been amicably adjusted had any such machinery as Mr. Ritchie proposes been in existence.

## COLOUR DECORATION.

BY COLE A. ADAMS.

(Continued from page 40.)

WHAT is the best style to adopt for *fin de siècle* decoration? asks the bewildered student. The hum from the battle of the styles fought in the sixties is now at rest, and we are content to admit in the nineties whatever is the fancy of the day, until may be, at no long future, an Architectural Association student will be found, sketch-book in hand, lost in admiration of the severe simplicity of Gower Street architecture. Yes, all is changed, and we are agreed that there is now no style in architecture which is worth dying for. For some years past men's faith in thirteenth century work as the *ne plus ultra* has been rudely shaken, and the influence of a younger school of clever architects, led by Sedding, changed our faith, or say, admitted into it greater latitude, and in the Church of the Holy Redeemer, Clerkenwell, and Holy Trinity Church, Sloane Street, we feel this force of Sedding's power and recognise what his teaching was; that we were free to adapt from the various styles what seemed most fitting and to cast aside the bonds of formalism which required chapter and verse for every feature introduced into a building. He declared, trumpet-tongued, that he, for one, would not be "cribbed, cabined, and confined" by canons which the older men had laid down, and maintained that salvation was also to be had in the "flat and pointed" with a little Classic, of a kind that would have made the men of the schools smile and wonder. Yet under Sedding's inspiration we feel, and more especially those who knew and loved him, the influence of his magic; and even though we may refuse to go all the way with him, we cannot but recognise the power and that something which it is difficult to define, but which we call genius.

### Sedding and his Imitators.

What Sedding's status will be in the hierarchy of art we must leave to the future; with the restraint that his genius imposed, what we feel, perhaps, inclined to condemn, we are compelled to condone. It is in his followers that we have to look for results, and we have not had to wait long for them; the illustrations published in the professional journals are many of them strange and eccentric. They exhibit a likeness to the work of the master, but the spirit is wanting in them. But though these efforts may fail, are they not the outcome of the cry for freedom from the shackles of formalism? If men, in the joy of this freedom, may here and there stray into the paths of licentiousness, let us not be too severe in our condemnation. In every known style under the sun there is truth and beauty, and a likeness which makes them all akin, and as the bee sucks the honey from every flower, so may we gather the sweets where we will. Who shall say that we are not to make use of ornament, no matter where we find it, if we have the wit; not a mere copying, but ideas worked out from it? "Whatsoever was written aforetime was written for our learning," may we not employ the words without irreverence? Evolution is at work now, as it ever was and ever will be.

### The Artist's Perplexities.

And what a perplexing state of things exists in our midst, and what difficulties it creates. The artist-decorator may, in the course of his practice, be called upon to decorate a church built in the Classic style, the Renaissance, the Romanesque, the Byzantine, the Mahomedan, or the Gothic; he will be required to do so in the correct style, as it is called, of the period of which the particular church is an example. Another time it will be a theatre, a concert or ball room, or mansion where maybe particular rooms are to be decorated in particular styles. Is it not, however, appalling, this demand upon the artist? No wonder if he bewails the age in which he has been born, and, from sheer weariness, closes his eyes and dreams of a time

in which one style was in vogue and one only; no newspaper critics, no art journals, no books on art, no cant and jargon of the stereotyped order—the one style, which yet gave infinite latitude to the ordered mind and the inventive genius. Small wonder that, with time to work out his idea, the Greek artist excelled in beauty of design which never lacked grace, and that quality of fitness and repose also to be found in the best Japanese art, which, alas! in its turn threatens now to become a thing of the past.

### Artist and Client.

One of the problems in colour decoration is to employ only those colours which will look well both by daylight and artificial light. These will be influenced again by the amount of daylight which is obtainable in the place which is to be decorated. Here only experience will guide you correctly, and here I may say how very difficult it is to prepare any sketch or drawing to show what you propose. Some artists positively refuse to do so, and no wonder. Still, there are clients who insist on having an idea of what the design is to be, and who will see a sketch first, and to a young artist just starting on his career, not to show what he is going to do may be fatal to his employment. Therefore, if it is insisted on, show as little colouring as possible, enough to give the general scheme, and guard yourself by saying that circumstances may compel you to alter as you go along. When the client has approved of a scheme, the best thing that can happen for both client and artist is, that the former shall go abroad for a short time and not see the work through all its stages until finished; for should the client not absent himself, but look in to see how the work is going on, he will in all probability destroy his own peace of mind and that of the artist.

### Conditions of Lighting.

Now interiors have to be used by daylight or by artificial light, and by both day and artificial light. By daylight, as picture galleries, banks, Courts of Justice. By artificial light, as theatres, ball-rooms, and other places of amusement, and by both day and artificial light, as churches, assembly and concert rooms, &c., and private houses. Under these conditions of lighting come others, and upon the way in which they are met will depend largely whether the decoration is successful or otherwise. A quiet half-hour in the place where you are called upon to show your skill, with sketch-book in hand, will be time well spent. If the place is used by daylight note what amount you have at your disposal, or will have when the windows are upholstered; what is the aspect, north, south, east, or west. Then to what use the apartment is to be put, and whether it is wanted for summer or winter use. Then, again, at what time of the year you see it, so as to judge of the amount of light; if a sombre and subdued effect is sought for, or a bright and cheery one. If, again, the apartment is to be used at night, obviously your colours must be tried by artificial light, and your experiments made by that kind of light which is to be adopted. If for day and night use you must use those colours which look well by day and night.

### Colour Trials.

The design thought out, you must first try the colours you are proposing to use upon the walls or ceiling, noting whether they are what you intended, and how one colour goes with another, always judging of this at the distance it will be when executed, and settling this upon the spot. This trial of colours upon the spot is of the first importance, as many are the changes that take place, and what looks well in one place looks bad in another. The experiments may be in colour only, without any design upon them, or you may, better still, put up full-size coloured cartoons *in situ*, and judge of the effect. Do not hurry over this stage of your work; it may take you hours only trying the colours and effects. Decoration needs the exercise of all the virtues, and patience in particular, and you cannot properly decide questions of colour with watch in hand nearing the hour at which your

train starts. Let him who thinks of embarking on the pursuit of decoration think on these things. When you get the colours and the design settled somewhat to your liking, you may consider yourself happy; vigilance will still be required, but the worst is over. If you have a good, intelligent, and honest foreman of painters, another great weight is taken off your shoulders; and by all means in your power interest those who are carrying out the work for you, and do not spurn their advice. It may be that you have to collaborate with some figure or landscape artist, and then your whole scheme of colour has to be subservient to his work. In fact, no two cases will be alike, and it will call forth all your powers of intelligence to meet and overcome the many difficulties that may arise.

### The Artist's Reward.

And the payment for all these years of study spent upon decorative work? Your payment must be in the first place the delight of doing colour and design, for it is seldom you are paid adequately for the labour and time it involves. You will sometimes find clients who are under the impression that the five per cent. will cover your expenditure of brains and time, and be genuinely surprised when you tell them that such payment is totally inadequate. A gentleman connected with a large firm of decorators once told me that they reckoned 20 per cent. in their estimates for the "brains," and for good work requiring special skill and much time, this is not excessive. Where a price is given for the work complete, a man knows what he is spending—stock, lock, and barrel—and pays the bill cheerfully. But if *plus* the actual cost of the decoration, a client has to pay the architect for his brains, skill, and time on the designing, he frequently feels aggrieved. Unreasonable, is it not? But a fact. Perhaps the best advice, from a purely commercial view, is to get what you honestly can, acquire a name and fame by judicious self-advertisement, strive to cultivate a manner, to become the fashion, by letting it be known far and wide by the blast of the sound of your own trumpet, that *you* are the artist to employ, and then Society will pay you anything in reason—and out of reason—you like to ask.

### The Discussion.

The Chairman, in opening the discussion, suggested that the lecturer's remarks as to the unsuitability of mosaic on flat surfaces were a little too sweeping. He instanced some of the work in St. Paul's Cathedral as an example of very beautiful work on a flat surface. He thought Japanese stencil work was worthy of close study, and urged the desirability of a closer sympathy between artists and architects.—Mr. L. A. Shuffrey, in proposing a vote of thanks, spoke of the importance to the architect of actual practice in painting. He did not like glazed tile work, but he advocated the use of polished marble.—Mr. J. D. Crace seconded the vote of thanks. He said that great injury was sometimes done to a building by the failure of the artist to get into sympathy with the architectural intention of the building. It was most important to try to realise what system of colour would best bring out features which were intended to be the expression of form in the building itself.—Mr. H. W. Pratt instanced the decoration of St. Paul's Cathedral as a case in which a method of decoration never intended by the architect had been adopted; he worded what Sir Christopher Wren would think if he could see the havoc that was being made with his magnificent building.—Mr. E. Howley Sim, and Mr. Matthew Garbutt continued the discussion, the vote of thanks was heartily agreed to, and the meeting terminated.

No. 17, Fleet Street, is to be pulled down and rebuilt, and set back 5ft. to widen the street. This quaint old building is nearly opposite Chancery Lane, and is spoken of as the palace of Henry VIII. and Cardinal Wolsey. The gateway to the Temple forms part of the building, and will also have to be set back.

# Professional Practice.

**Axminster.**—The chancel of Axminster church has recently been enriched by the addition of choir stalls, altar rail, and credence table, from designs by Mr. W. D. Caroe, M.A., architect of London. The credence table is a gift of the late Mr. G. A. Spottiswoode, Chatton Hall, Axminster. The work throughout has been executed in English oak, finely carved and traceried, and was carried out by Mr. Wm. Dart, Ecclesiastical Works, Crediton.

**Birkenhead.**—The new Liberal Club at higher Tranmere, Birkenhead, which is the gift of Mr. W. H. Lever, is now in course of erection. The building is of a Renaissance character, and will be of red brick with Brynteg ne dressings. The accommodation will include assembly hall to seat 400, billiard room, three tables, smoke room, reading room, refreshment bar, kitchen, store cellars, storerooms, and cloak rooms, retiring rooms, &c. The contract is let to Messrs. John Lee, and W. M. Bebbington, Cheshire, and the work is being carried out from the plans of Mr. T. Taliesin Rees, A.R.I.B.A., architect, Birkenhead.

**Blenau Festiniog (N Wales).**—The contract for the County Police Buildings, which are now being erected, has been let to Mr. Lachlan, whose tender was the lowest. The building will be erected of local stone and red sandstone designs. The design, which was selected in open competition, is from the office of Mr. T. Taliesin Rees, A.R.I.B.A.

**Bootle.**—The new Welsh Congregational chapel to be erected in Trinity Road, Bootle, has been entrusted to Mr. T. Taliesin Rees, A.R.I.B.A., Birkenhead. The design was selected from a number sent in a limited competition. The building will be erected in red brick and terra cotta.

**Dublin.**—The United Presbyterian Church in Lower Abbey Street has lately been enhanced by the addition of a memorial window, situated above the organ and behind the pulpit. It is circular in design, consisting of a large central opening, surrounded by six smaller circles, cusps, &c. The centre has been filled with a figure of Our Lord, while the surrounding panels contain pictorial representations of the four Evangelists, and of St. Andrew, and a floral design with memorial inscriptions. The tracery of the window is of an early English pattern, and the glass ornamentation, which follows the style of Albert Parker, has been designed with a view to preserving a harmony between it and the interior. Mr. Joshua Clarke, of North derick Street, Dublin, who has recently completed over thirty stained-glass windows in Ireland, was intrusted with its production.

**Lurgan.**—A new and handsome edifice has been erected by the Baptist congregation in Lurgan, just been opened for public worship. The building is located on Windsor Avenue. The church has been erected by Messrs. Redmond and McCullough, Lurgan, to plans by W. Redmond. The design is Gothic in style, and the building is of red brick, covered with red sandstone. It is 50ft. long, 10ft. wide, and is capable of seating 250 persons. The pulpit is an ornate modern, of rich unpretentious, structure, and the interior finish is chaste and agreeable. Modest vestries are situated at the rear of the edifice.

**Mistley.**—A new infants' school, annexed to the Norman Schools at Mistley, has been erected. The cost has been nearly £700. The architects were Messrs. Baker and May, and the builder was Mr. T. Canham, of Weeley. The building is an extension of the existing school, which were built at a cost of £4000 in 1856, "for the education of the children of the poor in the principles of the Church of England."

# Under Discussion.

## ALBRECHT DURER.

The ninth of the series of fortnightly lectures on Art subjects, at the Glasgow Corporation Galleries, was delivered on the 18th Feb. by Mr. J. Wilhelm Rowntree, of York, whose subject was "Albrecht Durer." Mr. Rowntree first alluded to the great commercial importance of Nuremberg during the Middle Ages, and pointed out that with its commerce its citizens enjoyed a large measure of freedom, and thereby a flourishing school of Art was fostered, just as in Glasgow the commerce and freedom of to-day have also evolved the famous Glasgow School. The highly interesting conditions of life under which the young Durer developed were sketched in a graphic manner. He was born when the Renaissance had made rapid progress south of the Alps; in his own country the great Reformation movement was in process of evolution, and Albrecht Durer was a friend and correspondent of many of the first leaders of that tremendous contest. The many circumstances in his life were then dealt with, and thereafter a most complete and exhaustive series of illustration of his works were shown on the screen, and commented on with much vigour and discrimination.

## STYLE IN ARCHITECTURE.

Mr. Leslie Ower, F.R.I.B.A., delivered a lecture on February 18th, to the students' section of the Dundee Institute of Architecture. There was a large attendance, and Mr. C. Soutar, the honorary secretary, presided. Mr. Ower's subject was "The evolution of style in Architecture." In the course of his lecture he said what the British style might be like when it had arrived at its perfection—whether it would be akin to Renaissance, Gothic or Classic; whether the chief material would be stone or brick, or iron, or concrete, or some new thing undreamed of in our philosophy—it would be idle to speculate. Meantime let them with unprejudiced minds and honesty of purpose strive to satisfy the wants and aspirations of the age they lived in, using judiciously but fearlessly the new inventions, materials, and opportunities which their scientific age and powerful nation had so abundantly provided for them, designing with beauty and building with truth, assured that thus, and thus only, would they worthily fulfil their part in the creation of a national style of that great and noble art which they all so much loved and admired. The lecture was illustrated by lantern views of ancient and modern buildings.

## COMING EVENTS.

### Wednesday, March 1.

EDINBURGH ARCHITECTURAL SOCIETY.—A. Balfour Paul, on "The Treatment of the Staircase." 8 p.m.  
MANCHESTER MUNICIPAL SCHOOL OF ART LECTURES.—T. J. Cobden-Sanderson on "Bookbinding as an Art." 7.30 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.) Inspection and demonstration in the Parish of St. George's, Hanover-square, at 2 p.m. Conducted by Mr. Albert Taylor.

NORTHERN ARCHITECTURAL ASSOCIATION.—J. Walton Taylor on "The Bricks used in Northumberland and Durham." 7.30 p.m.

ROYAL ARCHEOLOGICAL INSTITUTE.—(1) H. S. Cowper, F.S.A., on "The Influence of the Roman Occupation on the Distribution of Population in Cumberland and Westmoreland." (2) W. H. Knowles on "An Effigy of a Knight in Warkworth Church, Northumberland." 4 p.m.

BRITISH ARCHEOLOGICAL ASSOCIATION.—The Rev. W. S. Lach-Szyrma, M.A., on "Thoughts on Ancient British Costume." 8 p.m.

SOCIETY OF ARTS.—Wilton P. Rix on "Leadless Glazes." 8 p.m.

ST. PAUL'S ECCLESIASTICAL SOCIETY (Chapter House, St. Paul's).—J. Lewis André, F.S.A., on "The Mural Paintings of Sussex Churches." 7.30 p.m.

### Thursday, March 2.

LONDON INSTITUTION.—The Rev. Canon Benham, D.D., on "St. Alban's Abbey." 6 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.) Prof. A. Bortock Hill, M.D., on "Trade Nuisances." 8 p.m.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—The First Conversation at the Galleries of the Royal Institute of Painters in Water Colours, Piccadilly. Exhibition of Paintings in Pastel.

INSTITUTION OF ELECTRICAL ENGINEERS.—G. Marconi on "Wireless Telegraphy." 8 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Student's visit to the works of Maudslays, Sons, and Field, Westminster Bridge-road, S.E. 2.30 p.m.

### Friday, March 3.

ARCHITECTURAL ASSOCIATION. A. Saxon Snell on "Public Baths." 7.30.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMAN'S SOCIETY.—James McKisack, on "Half-Timber Work," with limelight illustrations. 8 p.m.

INSTITUTION OF JUNIOR ENGINEERS.—W. R. Cooper, M.A., on "The Direct Production of Electricity from Carbon." 8 p.m.

ROYAL INSTITUTION.—Lord Rayleigh on "The Mechanical Properties of Bodies." IV. 3 p.m.

SOUTH KENSINGTON MUSEUM (Lecture Theatre).—William Burton on "Pottery." II. 3.30 p.m.

### Saturday, March 4.

ARCHITECTURAL ASSOCIATION.—Third Spring Visit. SANITARY INSPECTORS' ASSOCIATION.—Professor W. W. F. Pullen on "Furnaces and Smoke Prevention."

BRITISH INSTITUTE OF CERTIFIED CARPENTERS.—Visit to the Prudential Assurance Office at 3 p.m. H. A. Davey on "Shoring," at 6 p.m., at Carpenters' Hall.

### Monday, March 6.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Exhibition of Institute Drawings. Nomination of Officers.

LIVERPOOL ARCHITECTURAL SOCIETY.—Edward S. Prior, M.A., on "Business in Architecture."

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—A. C. Dickie, on "Some Early Christian Churches in Palestine." 8 p.m. Preceded by a business meeting, including election of Royal Gold Medalist.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Alfred Hill, M.D., on "Diseases of Animals in relation to Meat Supply; Characteristics of Vegetables, Fish, &c., unfit for food." 8 p.m.

SOCIETY OF ARTS.—(Cantor Lectures).—Archibald Sharp, A.M.I.C.E., on "Cycle Construction and Design." III.

VICTORIA INSTITUTE.—Meeting at 4.30 p.m.

### Wednesday, March 8.

EDINBURGH ARCHITECTURAL ASSOCIATION.—James Campbell Irons on "The Architectural Antiquities of Leith." 8 p.m.

MANCHESTER MUNICIPAL SCHOOL OF ART LECTURES.—Hugh Stanners, F.R.I.B.A., on "Storation in Manchester."

NORTHERN ARCHITECTURAL ASSOCIATION.—Annual Meeting at 7.30 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and demonstration at the L.C.C. Municipal Lodging House, Parkes-street, Drury Lane, at 3 p.m. Conducted by Frank Ruddle, of Estates and Valuation Department L.C.C.

SOCIETY OF ARTS.—Ordinary Meeting at 4.30 p.m.

### COWES URBAN DISTRICT COUNCIL GAS DEPARTMENT.

The Cowes Urban District Council invite TENDER for the ERECTION of COAL STORES, comprising steel and iron structure on concrete foundations and covered with wrought-iron roof in two spans; each 35ft.

Plans may be seen at the office of the Engineer and Surveyor to the Council, and specifications and form of Tender can be obtained on payment of the sum of Five Shillings, which will be returned on receipt of a bank note.

Sealed Tenders, endorsed "Tender for Coal Stores," are to be delivered to the Secretary, Mr. W. M. HALLIDAY, 45, High-street, Cowes, on or before MONDAY, the 13th day of MARCH, 1899, not later than TWO p.m.

The Council do not bind themselves to accept the lowest or any Tender.

Council Offices,  
Cowes, I.W.  
February 21st, 1899.

JOHN W. WEBSTER,  
Engineer and Surveyor.

## THE FORMATION OF SOILS.

By GUY CADOGAN ROTHERY.

(Continued from page xiv.)

**INFLUENCE OF CLIMATE.**—The combined effects of all these agencies of "weathering" are prodigious, but will vary largely in different localities, not so much owing to the prevailing geological formation, but because of the atmospherical and meteorological conditions. This fact is well brought out by Professor Hilgard in contrasting the influence of the arid climate on the granitic rocks of the southern Alleghanies, the plateau west of the Rocky Mountains, and in California and Arizona, with the more humid climate prevailing on the Atlantic slope. In the first instances, and in that of the Sierra Madre, the sharpness and roughness of the rocks are remarkable; but where the granite has been exposed to the Atlantic humidity the granites are "rotten," the mountains being rounded off, while in most positions it is impossible to find sound, unaltered rock at a less depth than forty feet. Climatic conditions influence quite as strongly the qualities of soils, for in humid regions where there is much rain a large percentage of the salts and minerals is washed away, and there is a considerable difference between the upper layers and the subsoils. On the other hand, in dry climates, where the rains are torrential, but rare, and of short duration, salts are washed down to only a slight depth, and then, owing to the lightness of the soil and the heat, capillary action is great, and evaporation is also abnormal, so that the salts are brought to the surface again, which gives rise to the alkaline lands of Asia, Europe, and America. Dry, warm climates generally conduce to a striking uniformity of soil characteristics for considerable depth. Professor Hilgard instances a case of a cellar near Nevada City, California, 7ft. to 10ft. deep, where the red subsoil mass dug out was spread over a part of a vegetable garden close by, and as a venture the annual vegetables were sown on it. They not only did well, but even better than those on portions not covered, which had been cultivated for a number of years. Even material from 30ft. depth, he says, acted similarly, showing that it possessed an abundance of the mineral salts which furnish the nutritive elements to the plant life—a wealth due to the dryness of the climate.

Soils are divided, as regards locality of formation, into sedentary and "transported." The sedentary soils are the result of rock disintegration, which remain in position. They are generally of a loose and stony character, the pebbles being of an angular form. Transported soils are rock debris moved from one place to another by different agencies. They are divided into "drift" soils, moved by winds, ice floes, or landslips, and "alluvial" soils, transported by water. Drift soils are very similar in physical qualities to the sedentary classes, being loose and stony, but more worn and rounded. Water transports soils in various ways. Rains and rivers wash down rock debris, and seas and lakes sap and undermine coasts and banks, earthy matter being carried along by the moving waters, and the solid matter is gradually deposited as the water loses its velocity or becomes calm. The tendency of water is to mechanically separate the rock debris according to their size, shape, and specific gravity. The heavier and most angular solid particles are first deposited, while the lighter matter is carried longer in suspension, moved furthest away, and deposited the latest. Thus alluvial soils are usually very uniform in physical character, though local circumstances may modify general tendencies. Clays are the principal type of fresh water "alluviums," while chalks are the types of sub-oceanic deposits. Lime is washed out by the rain and river water charged with carbonic acid, and is present in sea waters as a minutely separated powder, which under the ordinary restless state of large bodies of water, with their currents and constant upward and downward motion caused by tides, evaporation and

changes of temperature, would not easily gravitate to the ocean bed; but the waters are crowded with small living creatures, the radiaria and diatomaceae, which secrete the lime in order to form delicate shells, they float on the surface of deep seas in profusion, and as they die, the shells fall down very slowly but in a continuous rain. Then there are the globigerinæ, with their comparatively heavy, solid shells, aggregated together, more or less, forming chambered globose segments, often seen as coccopheres, a mass of protoplasm enveloped in calcareous shells. Vast tracts of the Atlantic bed are covered with globigerina mud, which in its first stage appears as a grey coloured ooze of great depth, in which globigerina, coccopheres, larger shells and fish bones are buried. At greater depths the deposit assumes more consistency, while the traces of shells and animal remains become rare and tend to disappear altogether, as it hardens into chalk.

Professor Huxley has shown that chalk formations on land are exactly similar, and consist principally of globigerina with silicious sponges, mollusca, crustacea, and schimoderms. Professor Thompson believes this ocean globigerina mud to be a continuation of the Cretaceous formation. These chalk formations are very compact, but are hollowed out into caverns and channels, by the action of water. Coral polyps also play an extensive part in building up calcareous rock formations with their skeletons formed with the lime extracted from the sea. Polyps are widely distributed over the globe, but the most important are the white coral polyps in seas of warm latitudes. They secrete carbonate of lime to form their skeletons, which are hard, though more quickly formed than the red corals of the Mediterranean. Darwin has shown that white coral polyps cannot live at greater depths than from twenty to twenty-five fathoms; but we know that coral rocks and islets run down fifty and a hundred fathoms in the sea, and then show up well above the waters. This is explained by the gradual sinking of the sea bottom, with perhaps a final rise. The polyps form a fringe on the shallow sea bottom round land, and gradually build from their fifteen or twenty fathoms to the water's edge, then as the bottom sinks they build up and up, so that the roots of these coral tree islands are hundreds of feet below the level of the sea. A very considerable amount of land is due to the work of these coral polyps, for their spiky calcareous skeletons form extensive reefs near the sea-level, in which other animal forms, vegetable debris, drift, etc., is caught up, by which means soil is formed, wherein water floated and wind drifted seeds of water-loving plants, such as the cocoanut palms, etc., germinate, and afford a stronger nucleus for soil formation, aided occasionally by volcanic submarine action, which may cause an upheaval. Molluscs and crustacea also derive the lime for their shell from the sea water. Oyster shells vary considerably in their composition according to locality. At Herne Bay the organic matter in the shells is 0.096, phosphate of lime 0.047, carbonate of lime 0.857; in those of the North Sea, organic matter is 0.041, phosphate of lime 0.011, carbonate of lime 0.948. And yet there is only a very small trace of neutral carbonate of lime in sea waters. It has been suggested that part of this carbonate may be obtained by the molluscs and crustacea direct from the rocks; in which case they would be a direct cause of disintegration, and indirectly of soil formation.

Most alluvial deposits make heavy, dense soils, generally very uniform, though often stratified, owing partly to variations in the deposit, and also to the movements of the earth's crust, which being alternately elevated and depressed, modifies the tendencies of the agencies at work. Thus an alluvial soil may be considerably modified either by the silting up of a river, estuary or lake, or the withdrawal of the water, when other soils may be transported and deposited over it, or be intermixed with it by the action of ice, wind, or landslip. The Fen country offers a very interesting geological lesson. It is quite clear that at one time, when England was joined to the Continent, it formed compara-

tively high land. It was then depressed, probably below the sea-level; this was followed by an upheaval, and we find upon the clays evidence of the Glacial Period, with its formation of Boulder clays and strangely transported rock debris from the far North. Over this a pasture and forest covered land was formed, which, on being depressed and flooded, was encroached upon, and swallowed up by peat-bogs. But there again came a gentle upheaval, so that peat bogs have long since ceased to be actively formed, the living mosses have disappeared, and thus we now find pasture both under and above the peat, and alluvial deposits. These successive changes caused the rivers to alter their beds, eating their way through hills, and bringing down fresh kinds of alluvium.

**CLASSIFICATION OF SOILS.**—Soils are further divided into "gravels," more or less broken up rock debris, generally silicious in nature; "sand," a minute form of gravel, but usually of a silicious nature, though in places calcareous. Sands in Southern Seas are nearly always formed from coral debris, and consequently are calcareous; "calcareous" soils, more or less divided earthy matter with lime; "clay," finely divided granite and plutonic rock debris, containing felspar and potash (Kaolin) mixed with more or less sand, humus, etc., which is of a compact nature, rich in aluminium and silicates; "loam," a mechanical mixture of clay and sand; "marls," mixtures of lime and clay; "humus" and "peat," of a vegetable nature. But these terms are somewhat loose, being capable of varying application, and the soils in each division though bearing certain chemical and physical characteristics in common with their classes, may really differ widely from each other. The size of the particles composing the soil is of the utmost importance, both as regards their relation to health, and their stability and other physical properties. Indeed, the physical characteristics of soils are generally of greater moment than their chemical formation, even as regards agriculture. Professor Hilgard shows how much depends upon physical phenomena. "It makes a material difference," he says, "whether the grains of sand contained in a soil or clay are prevalently half a millimeter in diameter, or the tenth or twentieth part of that amount, sand (or more properly silt) of the latter size is by no means impalpable; and yet a soil containing 50 per cent. of this substance might be exceedingly heavy in tillage, while it would be light if the sand grains approached 0.5 millimeter in diameter. And it would make an equally material difference, whether or not the impalpable matter classed as "clay" were really, in the main, silicate of alumina, or simply silex, or other mineral powder." The physical composition of a soil will largely determine its porosity, permeability, power of absorbing and retaining moisture, atmospheric air and heat. Minuteness of division tends to make a soil "heavy" and less permeable both to water and heat. But very loose, sandy, or gritty soils, though permeable, have no high retentive powers for either moisture or heat.

Capillarity, and, consequently to a large extent, evaporation and radiation, are mainly influenced by physical conditions. In a moderately compact soil the qualities are highly marked, but if the particles are very minutely divided, and a really "heavy" soil is the result, the capillarity is low, as are absorption, evaporation, and radiation. Consequently, "heavy" soils are cold or either very dry or very wet. But while the physical peculiarities are so important, the chemical composition of soils must not be neglected. As Professor Hilgard points out "clays" differ widely according as alumina, silex, or other minerals prevail. The pure Kaolin, a gelatinous mass, which becomes hard like horn, swells up as a sponge when wetted, but if mixed with iron, remains horny in the presence of water. Much iron in a soil increases its absorptive powers as regards atmospheric air. Iron if prevalent also colours the soil, and colour mainly influences the absorption of sunrays. A red or dark yellow, and even a black soil will generally be warmer than a lighter coloured one.

# Trade and Craft.

## THE AMATEUR PHOTOGRAPHERS.

The new 1899 catalogue issued by the Thornton-Pickard Manufacturing Company is a tiny little booklet, of which every amateur photographer would do well to obtain a copy. It contains a number of useful hints to photographers; also illustrated particulars of the Company's well-known specialities, and of many others which, being new, are less known, perhaps, but are, nevertheless, deserving of attention. The catalogue is profusely illustrated with excellent reproductions of photographs which secured prizes in a recent competition held by the Company; none of these are very clever and interesting. The booklet will be sent post free on application to the Thornton-Pickard Manufacturing Company Ltd., Altrincham.

## A NEAT POCKET-BOOK.

The Blackman Ventilating Company, of 63, Abchurch Lane, London, E.C., have issued a very neat and convenient little pocket-book, which is fitted with a pencil and a patent self-opening pencil, and contains, in addition to a number of blank pages for memoranda, a Railway Accident Insurance coupon for £500, available for twelve months. At the beginning of the book are a couple of pages of information, which will doubtless be useful to many, with regard to the Company's ventilating and drying systems. It appears that the Company have delivered 40,000 fans from their works in London into every civilised country in the Western Hemisphere. It is very justly claimed at there must now be a large army of workers who are daily being kept healthier and more efficient by means of the Blackman fans, as an hourly duty of the fans that have been sent out is now one million and a quarter tons of air. The pocket-book is, of course, primarily an advertising medium, but it is none the worse for that account. Indeed, we welcome it as an example of the possibility of introducing trade specialities in a manner that is at once effective and wholly free from the aggressive ugliness that characterises so many present day advertisements.

## A COMPACT FILING CABINET.

There is a great variety of arrangements for filing letters and other documents at present on the market, but the matter is of much general importance, especially to those who have many documents needing preservation, and but little space in which to keep them, that many readers will doubtless be glad to have their attention called to a system that presents many points of unusual excellence. The great desiderata in any filing system are the safe preservation of the documents, compactness, and facility of reference. These requirements are better met in the McKenzie Filing Cabinet than in any other system we have seen. The cabinet, which, by the way, we have lately introduced into our office, is supplied either in solid oak or walnut, or in a cheaper wood stained and polished. It is divided longitudinally into the middle, the parts being connected by strong hinges. Both the body and the wings are divided into compartments, each of which a "Silex" filing case is placed. The cabinet is weighted to ensure stability, and the wings run on castors, to prevent sagging. When closed it has the appearance of an ordinary cupboard. When one of the cases is full it can be taken away to the storeroom without being emptied, and a new case can be obtained, to replace it, at a cost of 3s. The "Silex" filing cases have many virtues of their own; they are strongly made, the sides being of wood, not cardboard; they are fixed with a special catch, which keeps them almost perfectly dust-proof, and each one contains twenty pockets arranged alphabetically. The manufacturers are Messrs. McKenzie and Co., 5, Augustus Street, London, who will make their cabinets of any size and any design that may be ordered; they will also adapt their system to fit a recess.

# INSANITARY AREAS AND HOUSING SCHEMES.

By PETER ADDIE, F.S.I.

IN dealing with this very large question, I will begin by quoting the Acts under which most of the Improvement Schemes have been worked. In 1875 was passed the Artisans and Labourers' Dwellings Improvement Act, 38 and 39 Vict., which was designed to be of great benefit to municipalities in the removal of insanitary areas, and in 1890 followed the Housing of the Working Classes Act, 53 and 54 Vict., the object of which was to make the acquirement of areas easier and less costly. The first step in the procedure is, as is well known, based upon the official representation of the medical officer, which is imperative, but in case that official will not act upon his own initiative, two or more justices of the peace or twelve ratepayers can compel him to submit a representation stating the facts as he finds them.

Immediately upon the passing of the 1875 Act, Birmingham and Swansea adopted it, and formulated schemes both of which I have had the honour of being connected with, in the first place at Swansea, and later at Birmingham. In Swansea what is known as Alexandra Road was evolved and cut through a very squalid and dilapidated area, within which the average death-rate was estimated at 40 per 1000. It included fourteen acres, three acres of which were devoted to streets. The usual stipulation was made for the housing of the disturbed population, but it was shown that local enterprise was sufficient in the undeveloped portions of the Borough to provide for the disturbed population, and the scheme was accordingly modified and the salvages were relieved from the embargo of being used only for the purpose of re-erection of artisans' dwellings. The cost of the scheme was estimated to be for the property required £79,166 and the estimated value of salvages and houses not taken down was £67,078. Deducted from this was the Corporation interest in property to be taken in the Greenhill district, viz., £1044, leaving an estimated permanent charge to the Borough of £11,044. But at that time a very lenient view of human nature was taken, with the result that this amount was very much exceeded, the actual amount borrowed for the purposes being £120,000, and although the waiving of the provisions for re-erecting dwellings helped materially the future development, financially a very heavy charge remained. But this much may be said, that an undesirable colony has been removed from the centre of the town, a marked improvement made upon the death-rate of that particular area, the rateable value has been increased, and a continual source of complaint, both as to health and crime, absolutely abolished. These results go far towards removing any feeling of distrust and complaint of extraordinary cost.

In Birmingham the area dealt with was forty-five acres, about nine acres of which were used for new streets. The representation described the insanitary condition of the district, the crowded and dilapidated state of the buildings, and a high death-rate existing in St. Mary's Ward (namely, 26.82 per 1000, as compared with 13.11 per 1000 in Edgbaston Ward) and suggested measures for remedying the evils described.

Upon obtaining possession of the necessary properties, operations were commenced without loss of time for forming the proposed new streets. Corporation Street, the principal thoroughfare, was commenced in August, 1878, and completed for traffic early in 1882. The width of the street, after much discussion, was fixed at 66ft., of which each footpath absorbs 14ft. The length of the portion now opened is 851yds. The length of the section still to be made is 633yds., making a total length of 1484yds. Several other new streets have been constructed and others materially widened. During the progress of the scheme it was found necessary to obtain modification orders varying the powers originally given, but no unnecessary

difficulties were raised by the confirming authority.

For the accommodation of persons of the labouring classes displaced by the scheme, an outlying area lying between Newtown Row and Summer Lane was acquired, and upon this site sixty-two workmen's houses and twenty retail shops have been erected by lessees of the Corporation. Upon the land in the area set apart for the erection of similar dwellings, 103 houses have been erected by the Corporation.

The total quantity of land purchased by the Corporation is 218,099 square yards, or about 45 acres. This area has, so far, been dealt with as follows:—

	Sq. yds.
Let on building lease ... ..	57,872
Sold or exchanged ... ..	17,393
Site of Victoria Courts ... ..	5600
Site of Artizan's Dwellings in Ryder Street ... ..	9766
Required for new streets and widening old ones ... ..	40,526
Still occupied by rent producing property ... ..	76,375
Cleared for letting ... ..	10,567
	<hr/> 218,099

About 1867 houses and 814 other buildings have been acquired, and of these 1002 houses and 427 other buildings have been taken down. Fifty-seven licensed premises were included in the above, and up to the present time twenty-three have been abandoned, the remainder being still in existence or transferred to new buildings erected upon the area.

The Town Clerk of Birmingham, in a paper read to the Royal Statistical Society on the financial aspect of the scheme, says:—"The dwelling house improvement fund, created under the Artisans' and Labourers' Dwellings Act and Order, has been a great cost to the Corporation, but the results have amply justified the expenditure."

The Dwelling House Improvement Account at March 31st, 1898, was as follows:

	£	s.	d.
Net expenditure on general account ... ..	1,551,137	0	6
Net expenditure on Artizan's Dwellings ... ..	18,000	0	0
Deficiency on revenue account, accumulated during the years 1880-92, now capitalised ... ..	117,011	7	10
Total net expenditure on capital account ... ..	£1,686,148	8	4

The money required for the scheme was borrowed for a term of sixty years, with the exception of the £18,000 expended on the erection of the artizan's dwellings, which was borrowed partly for forty and partly for fifty years.

An amount is provided from income each year for the repayment of these loans, sufficient to repay the whole within the periods for which they have been borrowed. The amount set aside for this purpose last year was £15,023, and the total amount so provided since the commencement of the scheme is £221,977, this sum deducted from the net capital expenditure as above, leaves the present liability in respect of the undertaking at £1,464,171.

In return for this large expenditure, the Corporation are now in possession of an income from well secured ground rents amounting to about £41,000 per annum, which will be further increased during the next four years (without any new lettings) to about £43,000 per annum, but from this figure must be deducted a rent charge of £3000 payable in respect of property acquired from the trustees of the King Edward VI. Grammar School, leaving the net income from the ground rents at £40,000 per annum.

A rental of about £18,500 per annum is also being derived from the shops, houses, and buildings still standing on the improvement area, and after deducting £1000 from this item in respect of rates, repairs, and other outgoings, a net income is available from this source of about £14,500 per annum.

(To be continued.)

## Masters and Men.

**Scottish steelworkers** have just obtained the fourth advance of 5 per cent. during the past eighteen months, making in all 20 per cent. since the trade began to revive.

**Leeds engineers' labourers** recently applied to the Employers' Federation through the Gasworkers and General Labourers' Union for an advance in wages of 2s. per week. A meeting of the Leeds Employers' Federation has just been held to reconsider the matter, when it was unanimously decided that the application could not be entertained.

**The Dundee moulders** have presented a petition to the masters asking an advance of 1s. per week on their wages. An arrangement exists between masters and men that three months' notice is given on either side when any change is desired, so that the masters have until May 12th to decide upon the matter. The minimum wage in Dundee at present is 37s. per week.

**The Dundee engineering trade** is in a somewhat unsettled state. In the autumn of last year it was anticipated that trade would be brisk till the summer at least, and the employers promised an increase of wage, which came into force recently. There now appears cause for believing that these hopes are not to be altogether realised. At present there is not so much work on hand as was anticipated, and a few of the workmen have even been paid off.

**Lancashire Engineers and their Wages.**—A conference between employers in the Lancashire engineering trade and representatives of the Amalgamated Society of Engineers and the Steam Engine Makers' Society has been held to consider an application from the Bolton engineers for an advance of wages of 2s. per week. The employers refused to grant the concession on the ground that the time was not opportune for an advance, but suggested that the matter be reconsidered in six months. Mr. Barnes, the engineers' secretary, did not agree, and appeal will be made to the Federation.

**The Plasterers' Dispute.**—The hopes that were at one time entertained of an amicable settlement of this dispute seem doomed to disappointment. A general lockout of plasterers has been determined upon, and unless the unexpected happens it will be enforced throughout the kingdom from Monday next. The events that have led to this situation may be briefly summarised. To the masters' demand for an assurance that the operative plasterers would agree to discontinue the objectionable practices complained of, Mr. Deller, the secretary of the Plasterers' Union, replied that the whole matter would be put before all the members of his association, whose votes were returnable on March 1. He added that his Council were quite willing to discuss with the Masters' Association the points at issue. To this the secretary of the Masters' Association replied that unless there existed a determination on the part of the plasterers to persist in the objectionable practices complained of, there could be no reason why the assurances required should not be given at once. His Association had, therefore, decided to lock out the plasterers from March 6th until such time as the required guarantee should be given. The London Master Builders held their annual general meeting last Thursday and pledged themselves to a strenuous support of the policy of the National Association. The result of the men's ballot will be laid before the executive committee of the Union at their meeting to-morrow, and the policy of the Union will then be definitely decided upon. The one remaining chance for peace seems to be that the provincial members of the Union, some of whom feel very sore at the prospect of having to leave their work when trade is good, and they have themselves no quarrel with their em-

ployers, may give a majority in favour of the acceptance of the masters' terms. That chance, however, is very remote. There are at present about 13,000 members in the Plasterers' Union, but the effects of the lock-out will certainly not be confined to them. The stoppage of the plasterers' work will inevitably throw many other workmen in allied trades out of work.

**Workmen's Compensation: An Interesting Decision.**—At the Bradford County Court on February 7th, Judge Bompas, Q.C., gave judgment in the case Lacey v. Calverley, the evidence in which had previously been heard by him. It was a claim for compensation under the Workmen's Compensation Act brought by Margaret Lacey, of Wibsey, on behalf of herself and daughter, against Ham Calverley, contractor, Wibsey. The applicant's husband was in the employ of the respondent, and was digging a drain for him in August last, when the sides fell in and he was suffocated.—His Honour said the case had caused him a great deal of difficulty. It was contended by the respondent that the accident was the result of wilful and serious misconduct on the part of the deceased. The respondent gave the deceased express orders to timber the sides of the drain as he went on, and on the morning of the day of the accident he actually stopped deceased from working until a second workman had leisure to help him in timbering. About 1.30 the deceased and Ezra Calverley returned to work, and commenced to timber the excavation; at 3.30 the sides fell in and crushed the deceased. At the first hearing the respondent said that this occurred whilst the deceased was engaged in carrying out his directions to timber the drain. It seemed to be generally admitted that if the timbering had been properly completed the accident would not have happened. Considering the time that elapsed between deceased commencing to timber and the occurrence of the accident, he thought one of the following causes must have occasioned the accident: (1) The deceased wilfully abstained from completing the timbering because he disliked it; or (2) he partly undid the timbering, as stated by a witness in his evidence at the last hearing; or (3) through negligence or ignorance he improperly constructed the timbering, so that it gave way. If either of the first two was the cause, it was serious and wilful misconduct on the part of the deceased; if the third, it was not. On the whole he thought there was reasonable ground for believing that it was one of the first two causes, probably the first, and not the third, which occasioned the timbering being in such a state that the earth fell in. He was, therefore, of opinion that the accident was attributable to the wilful and serious misconduct of the deceased, and he gave judgment for the respondent. He was very sorry that the parties had not come to some agreement, because he thought that in moral, if not in legal, fairness something ought to be given to the widow and orphan of the deceased. He hoped that the respondent, in so far as he was able, would do something to allay the suffering and misfortune which had undoubtedly fallen upon the widow of the deceased.

**Widening of Dundee Streets.**—For some time it has been felt that the statutory width of statute labour roads—namely, 40ft.—is too narrow where four-story tenements are erected on both sides, and in consequence Dundee Town Council recently resolved to negotiate for the widening of three statutory labour roads—namely, Dens Road, Provost Road, and Clepington Road—so that a width of at least 50ft. should exist between the building lines. The area of the ground to be thrown into these roads extends to about 168 poles, and the sum to be expended by the Council in executing the work of widening will amount to £2200. The work is to be proceeded with gradually. Dens Road and Provost Road, opposite the lands of Easter Clepington, are to be widened at once, and the work has been begun by Mr. Girrity. It is expected that within three months these two roads will be widened and a decided improvement effected.

## Engineering Notes

**The Vatican** has been installed with the electric light, requiring 6000 sixteen-candle lamps to illuminate the building.

**Recent borings round Spofforth** prove that there is an enormous quantity of water of exceptional purity in the neighbourhood to a depth of 130ft.

**An Electric Light Scheme for Beckenham** has been adopted by the Urban District Council. The estimated outlay for supplying the district is £37,000.

**Newcastle Tramways.**—Newcastle-on-Tyne City Council have approved of the overhead trolley system of electricity for the new tramways, but have undertaken that it shall not be applied to the central streets, pending the opinion of an expert as to the suitability of the streets for some other electrical system.

**A cart bridge over the Derwent** between Malton and Kirkham Abbey is proposed to be erected near Huttons Ambo Station. Mr. Rudgard, in the office of the Railway Company's engineer, has prepared plans. His estimate for an iron girder bridge to carry ordinary traffic is £1200, but to carry traction engines there would be an additional cost for bridge and approaches of £700. A committee is to be formed to solicit grants from the County Councils, landowners, and others interested.

**Bollington Water Supply.**—The formal ceremony of turning on the supply of water to the township of Bollington was performed last week. The spring is situated at Rainow—a hilly district lying to the east of Bollington—the boring operations, which were conducted there on the recommendation of Professor Boyd Dawkins, being eminently successful. The water is collected in a reservoir, and the pressure obtained is sufficient to supply the whole of the district without the expense of pumping.

**The Belfast Mechanical and Engineering Association** held their seventh annual reunion last Saturday week, in Hick's Hotel Metropole, College Square North. The chair was occupied by the honorary president, Mr. John Horner, and the attendance was large. The honorary secretary (Mr. H. J. Fell) submitted the annual report, which was unanimously adopted. It stated that the past year had been one of continued progress to the association. They had elected one honorary and nine ordinary members.

**Contractors' Extras.**—Mr. Justice Ridley delivered judgment last Saturday week in the Queen's Bench in the case of Nuttall v. Barnstable and Lynton Railway Company. Mr. J. Nuttall, contractor, entered into an agreement to construct a railway from Barnstable to Lynton for about £40,000. After the railway had been constructed the contractor claimed a large sum in respect of extras, and this claim was referred to the arbitration of Sir James Szlumper, the consulting engineer, who awarded the contractor £22,634 11s. for blasting rock and £3569 for quantities in excess of those contained in the bill of quantities. It appeared that in constructing the railway the contractor found that a large quantity of rock had to be removed for blasting, and he accordingly removed it without obtaining the order of the engineer in writing or getting a price fixed for the work in accordance with the terms of the contract. For the contractor it was contended that the decision of the arbitrator was final and conclusive, and that the company were not entitled to have a special case stated. It was further argued that if the company were entitled to have a special case the contractor was entitled under the contract to recover the amounts found by the arbitrator. The Court, however, did not consider that these contentions were sound, and, therefore, judgment was entered for the company, with costs.

# Builders' Notes.

**Prices of Copper Goods.**—The extraordinary and combined rise in the price of copper has led to a general increase in the price of copper goods. One well-known firm has just added 5 per cent. to the net price of their copper goods.

**Ventilation for Public Buildings.**—In the ventilation of the new Hutchisontown Parish Church and Mission Halls now in course of erection (Mr. Alex. Adam, architect, Glasgow), "Cousland's Improved Climax" Patent Invisible Roof Ventilators and Air Panels are being used, supplied by the Climax Ventilating and Heating Company Limited, Glasgow."

**The Cement Famine.**—In our issue of February 15th we referred to the scarcity of cement, and the competition of German manufacturers. "Cement Maker," writing upon this subject to the "Morning Post," says that the English cement makers, relying upon their prior occupation of foreign markets, neglected to improve their cement by the adoption of those scientific methods which the Germans have introduced. These methods have, however, been adopted here in recent years, and there are several works on the Thames and Medway which now manufacture cement equal to any produced on the Continent, and a general improvement is being shown. The inferiority of English cement in the past has been due quite as much to the civil engineers of this country as to the manufacturers. It was the part of these engineers to investigate the various qualities of the materials they employ, and to lay down clearly the tests applicable to them. There is no consensus, no standard of quality to regulate the trade. The case is totally different in Germany, where a uniform standard exists, a standard based on scientific and experimental data. Cement makers there know what they have to do, and the engineers do not expect impossibilities from them, or the fulfilment of incompatible conditions. The ancient practice still prevalent in England is to test the strength of cement by the breaking strain applied to neat cement, which is never used so, but always mixed with a large proportion of sand or similar substances. The Germans employ only sand tests. Again, an old English test is that of weight per bushel, designed to exclude light-burnt cement. But very fine grinding is an essential in good cement. This fine grinding increases the bulk of the cement, and the test of heavy weight per bushel is in direct antagonism with it; yet the weight per bushel test still appears nearly all specifications in this country. It is superseded in Germany by the test of specific gravity, which is quite independent of the fineness of the grinding.

# Surveying and Sanitary Notes.

**Fulham Palace Road.**—The Improvements Committee of the London County Council have recommended that, subject to the Vestry of Hammersmith enfranchising the copyhold of the land to be added to the public way, and subject to the road being widened to not less than 45ft., the council give its consent and contribute one-half of the net cost of the setting back of the western side of Fulham Palace Road between Carnforth Lodge and the Duke of Cornwall public-house, such contribution not to exceed the sum of £5084.

**The proposed widening of Lower Thames Street,** between Fish Street Hill and Botolph Lane, E.C., still "hangs fire." If ever there was a place in the City which needed widening it is the locality in question. The London County Council was asked six months ago to say whether it would contribute towards the cost of the improvement, but as yet no answer has been given. Several houses are to let, and in some others the leases are about to run out, so that the present is a good opportunity.

**Paving of Goswell Road, E.C.**—The ratepayers in the portion of Goswell Road abutting on the City boundary, have asked the St. Luke's vestry to relay the road with wood or other noiseless material so as to enable them to carry on their respective businesses with comparative comfort. At present, it was stated, they often had to keep their windows closed in order to shut out the deafening sounds on the granite cubes. The Vestry have decided that as soon as the Old Street improvement is finished the whole question of the repaving of Goswell Road will be considered.

**Dublin Main Drainage Scheme.**—The works in connection with this great scheme, which are being carried out by Messrs. H. and J. Martin, of Dublin and Belfast, are proceeding steadily. The contractors have completed the Kilmainham branch, and they are just about finishing the Island Bridge branch, the works in connection with which were heavy, and they have also completed the sewers in the Poddle district. They are now engaged on sewerage work on the southern quays, at Crampton, Usher's, and Victoria quay's, intercepting all sewers on that side as far as Burgh quay. They have finished all the work on the northern side of the river, which includes the whole length of the northern quays, as well as the sewer to Annesley-place, by way of Abbey-street, Beresford-place, Store-street, Amiens-

street, and the North Strand. At present about 200 hands are employed on the main drainage works, but as the weather improves many more will be taken on. It is expected that the whole of the work will be finished towards the end of the year.

**The Whitehall Improvements.**—One of the most recent compensation claims against her Majesty's Office of Works in respect of the Whitehall improvement scheme was that of Messrs. Meynell and Pemberton, solicitors, who claimed £14,000 for the demolition of their office premises, No. 20, Whitehall Place. The claimant firm, which had existed at the address mentioned ever since 1835, had secured a Crown lease for a term of 99 years from July, 1820, at a rental of £98 6s. 9d. per annum. At the end of 1896, the Commissioners of Works served the notice to treat. The matter was referred to Mr. Robert Vigers, president of the Surveyors' Institution, who acted as sole arbitrator, and in the course of the inquiry it was submitted that the premises were worth £950 or £1000 a year to the claimants as occupying tenants. Evidence in support of the claim was given by Mr. G. H. Brougham Glasier, F.S.I. (Messrs. Glasier and Sons), Mr. Edward Tewson, F.S.I. (Messrs. Debenham, Tewson, Farmer, and Bridgewater), and Mr. H. C. Trollope, F.S.I. (Messrs. Trollope), whose valuations ranged from £6000 to £12,000. The arbitrator has just awarded the claimants £3478.

**Manchester Sewage.**—The following report of Mr. Baldwin Latham, M.Inst.C.E., has been received and approved by the Rivers Committee of the Manchester Corporation: "At your request I have carefully considered the question of the cost of the proposed bacteria beds for Manchester, consisting of sixty acres of such beds, with all necessary adjuncts for dealing with the sewage from 600,000 persons, together with the storm water. I may say that I am not able, in the absence of the necessary surveys and detail drawings, to give precise figures, but you may conclude that the cost of all these works will not exceed the sum of £300,000. I must remind you that the result of this expenditure will be to relieve the Corporation of Manchester from the large expenditure now incurred for chemically treating the sewage, and save other expenses in connection with the disposal of the sludge, which now entails considerable annual outlay. That the proposed works will be successful and relieve the Corporation of Manchester from all future embarrassment so far as the purification of the sewage is concerned there cannot be any doubt." This report is to be submitted to the Council, together with a resolution empowering the Rivers Committee to ask the Local Government Board to hold their adjourned inquiry at the earliest possible moment.

## COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
<b>BUILDINGS—</b>			
March 3	Darwen, Lancs.—Fireclay Retorts, Bricks, &c. ...	Corporation ...	A. H. Smith, Gas Engineer, Darwen.
3	Sowerby Bridge, Yorks.—Erection of Schools ...	School Board ...	C. F. L. Horsfall and Son, Lord-street-chambers, Halifax.
3	Leeds—Alterations, &c. ...	Trustees ...	S. E. Smith and J. Tweedle, 12, South-parade, Leeds.
3	Norton, near Cannock, Staffs.—School Additions ...	Trustees ...	Rectory, Norton Caves, near Cannock.
4	Buckie, Scotland—Erection of Masonry Bridge ...	Guardians ...	J. Barron, 1, Bon Accord-street, Aberdeen.
4	Omagh, Ireland—Cemetery Works ...	Guardians ...	J. L. Donnelly, 2, Bridge-street, Omagh.
4	Knarborough—School Buildings ...	King James's Gram. School Governors ...	W. Gill, Secretary to Governors, Knarborough.
4	Edinburgh—Chimney Stack ...	Gas Commissioners ...	W. R. Herring, Gasworks, Edinburgh.
4	Kings' Lynn—Classrooms, Offices, &c. ...	All Saints' School ...	L. F. Ealgeton, Bank-chambers, King's Lynn.
4	Littlehampton—Alterations, &c., to Laundry ...	Model Steam Laundry Co., Ltd. ...	H. Howard, Architect, Town Offices, Littlehampton.
6	Balieborough, Ireland—Altering Wards, &c. ...	Infirmary Guardians ...	H. Clarke, Clerk, Poor Law Office, Balieborough.
6	Blaydon-on-Tyne—8 Houses ...	District Industrial & Provident Soc., Ltd. ...	G. T. Wilson, 121, Durham-road, Blackhill.
6	Foulridge, Lancs.—Rebuilding Inn ...	John Kenyon, Ltd. ...	E. Neil, 9, Grimshaw-street, Burnley.
6	Ramsgate—Fireclay Retorts, Fire Bricks, Tiles, &c. ...	Gas and Water Committee ...	W. A. Va'on, Engineer to Committee, Ramsgate.
6	Rocheester, co Cork—Pair of Villas ...	County Council ...	W. H. Hill and Son, 28, South Mall, Cork.
6	Clayton-le-Dale, Lancs.—Bridge Works ...	Gas Company Limited ...	County Bridgemaster's Office, County Offices, Preston.
6	Shoeburyness—Gas-holders, &c. ...	Very Rev. Canon Shanahan ...	H. J. Robus, 21, Bucklersbury, London, E.C.
6	Thornaby-on-Tees—Infants' School ...	Hospital Board ...	E. Goldie, 31, Upper Phillimore-place, Kensington, W.
6	Tiverton—Hospital Buildings ...	H.M. Commissioners of Works ...	J. Siddals, Tiverton.
6	Putney, S.W.—Sorting Office ...	Glyncorrwg Board School ...	H.M. Office of Works, Storey's-gate, Westminster, S.W.
7	Aberwynn, Wales—School Alterations, &c. ...	J. Sykes, & Co. ...	O. P. Lambert, Architect, Bridgend.
7	Sowerby Bridge, Yorks.—Warehouse ...	Commissioners of Irish Lights ...	Jackson and Fox, 7, Rawson-street, Sowerby Bridge.
9	Kingstown, Valencia Island, co Kerry—Shore Dwellings, Lighthouse Keepers ...	Gt. Northern Railway Company (Ireland)	Irish Lights Office, Dublin.
9	London, E.C.—Shop fronts ...		J. C. Eley and Co., 1 and 2 Milk-street, E.C.
13	Dublin—Electric Power House ...		Engineer-in-Chief, Amiens-street, Terminus, Dublin.

## Property and Land Sales.

**FAIRMILE PARK**, near Cobham, Surrey.—A FREEHOLD BUILDING ESTATE of about 40 acres, with possession.

**MESSRS. DRIVER and CO.** have received instructions to offer to AUCTION at the MART, Fokenhouse-yard, Lottbury, NEXT SPRING (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairmile Station, and about a mile and a half from Cobham Station. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) possessing charming views over the intervening country to Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and will be included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of **CHARLES JUPP, Esq., Solicitor**, 48, Lime-street, E.C.; and of **Messrs. DRIVER and Co.**, 23, Pall Mall, S.W.

By order of Trustees.—Preliminary Advertisement.—Freehold Building Estate, Streatham, near West Norwood Railway Station.

**MESSRS. FIELD and SONS**, and **Messrs. WOLFORD and WILSHIN**, who are jointly concerned, will SELL by AUCTION, at the MART, at an early date, a valuable FREEHOLD BUILDING ESTATE, known as High View Park, comprising 16a. tr. 10p., lying immediately at the rear of and with approach from Leigham Court-road; also a contiguous Freehold Building Site of 2a. and 5p. in a new road intended to connect Canterbury-grove with Thurlby-road.

Particulars and plan, in due course, of **Messrs. KINGSFORD, DORMAN, and Co.**, Solicitors, 23, Essex-street, Strand; of **Messrs. WOLFORD and WILSHIN**, Auctioneers, Anerley, S.E.; and of **Messrs. FIELD and SONS**, as above.

For Land Syndicates, Building Societies, Capitalists, and others.

**PINNER**.—Important Freehold Building Estate of over 47 acres, with residence, known as Barrow Point, occupying a beautiful position close to the quaint old village of Pinner, within five minutes from the railway station on the Metropolitan line, and extending to within about  $\frac{1}{2}$  of a mile of Pinner Station on the London and North-Western Railway, having easy access from the West-end and City. The whole ripe for immediate building operations, and admirably adapted for villa residences of a superior class.

**MESSRS. FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY**, and Co. beg to announce that the above valuable PROPERTY, which they recently offered for Sale by auction, may now be treated for privately.

No. 29, Fleet Street, Temple Bar, and 18, Old Broad Street, E.C.

**IONOR OAK**.—Important Sale of FREEHOLD BUILDING LAND, forming an appreciable portion of one of the most salubrious and rapidly-increasing suburbs of the City of London, with numerous railway facilities to all parts of the metropolis, and presenting admirable sites for the erection of private Residences.

**MESSRS. FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY**, and Co. are prepared to SELL the few REMAINING LOTS of the above FREEHOLD BUILDING ESTATE, by private Contract.

No. 29, Fleet-street, Temple-bar, and 18, Old Broad-street, E.C.

**SANITARY INSPECTORS' EXAMINATIONS**.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above exams. by correspondence; no books are required.—or particulars and testimonials apply, "Certified each," 31, Herbert-road, Plumstead, S.E. 11

**ANSSELL and MALLOWS**, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C. 1

**I.B.A. EXAMS. PREPARATION**.—Personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural reading Library. Special three months' finishing courses.—For full particulars apply to **Messrs. OWGATE and BOND**, Associates I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum)

**I.B.A., SOCIETY OF ARCHITECTS**, and **CIVIL SERVICE TECHNICAL EXAMINATIONS**. Preparation by correspondence, in residence, personally.—**MIDDLETON and GARDEN**, 19, Craven-street, Strand, W.C.

NOW READY. Price Four Shillings.

## Laxton's Builders' Price Book FOR 1899.

"The acknowledged standard work of reference."

CONTAINING ABOVE 72,000 PRICES,

together with many useful and important Memoranda and Tables, and Prices and Descriptions of New Materials and Inventions suited to the Builder, Contractor and Engineer, and all Trades connected therewith.

The whole carefully corrected and revised according to the present Prices of Materials and Labour. Contains:

THE LONDON BUILDING ACT, 1894;

## An Architectural Causerie.

### The Opening of the Great Central Railway.

THIS week witnesses the crowning moments of a scheme which, once considered hope-

less, has now won to its fulfilment, after many years of fighting and working. The "Great Central" is no new railway, save in name and in the extension to London, now happily completed. As the "Manchester, Sheffield, and Lincolnshire Railway," it had its beginnings some sixty years ago, and for many

then apparent hopelessness of fighting for the Parliamentary sanction of the scheme against the virulent opposition of the railways interested in keeping this threatening competitor away. The then chairman of the M. S. & L. was Sir Edward Watkin, probably the greatest genius that railway management has ever produced. There is room for Napoleons in the railway world, and of such a build was this man. By sheer force of will and industry, he had won to a commanding position, and held at one and the same time the Chairmanships of four different companies:—the M. S. and L., Metropolitan, the South Eastern, and the East London Railways. There were jealous eyes and sharp wits watching his schemes when, step by step, he led the Metropolitan Railway past Harrow and into the provincial wilds of Rickmansworth and Aylesbury, and so on to Quainton Road; but few or none suspected for a long while that this was part of a great programme by which the M. S. and L. was slowly coming down south, and the Metropolitan marching north to meet it; subsequently to join hands. This was finally acknowledged when the time was ripe for the declaration. It was in 1891 that this happened, when the M. S. and L. had

fused to carry such very un-aristocratic freight; and when circumstances were too strong for them, the officials of that line, obliged at last to convey coals, carefully covered the trucks with tarpaulins, so that their shame should not be evident to the world at large. Circumstances have now-a-days proved so ironical that there are railway companies which would be only too glad of an opportunity for exchanging their un-lucrative passenger traffic for the now coveted carriage of the once despised coals.

C. G. H.

### The J. R. Roberts' Wing, Purley Schools.

OUR illustration shows the new wing which

has lately been added to the Purley Schools. The building has eight class rooms, four on either side of the main hall, which is 73ft. long, 31ft. wide, 25ft. 6in. high up to the collar beam, and will accommodate 400 people. Each class room is 22ft. by 16ft., and 13ft. 6in. high (4752 cubic feet), and is arranged to seat thirty-two boys, thus allowing about 150 cubic feet to each pupil. The new wing is connected to the old building by a range of cloisters 150ft. long, with a

THE J. R. ROBERTS' WING, PURLEY SCHOOLS. J. KINGWELL COLE AND KENNETH WOOD, ARCHITECTS.

years has been a powerful and extensive undertaking in the "waist of England," as that comparatively narrow stretch of our island between Liverpool on the west coast and Grimsby on the east, has been termed. As an east and west railway, with no outlet to London, it had long done a heavy trade in the coals, minerals, and multifarious manufactures of the busy Midlands; a carrying trade which in latter years totalled a sum of something over three and a half millions per annum. These goods were collected by the M. S. & L. at various points along their busy cross-country system and handed over to the three great trunk lines—the Great Northern, the Midland, and the London and North Western—at Doncaster, Manchester, Retford, and other junctions, whence they were carried to London; those great companies thus reaping nearly all the profits. As the then chairman of the M. S. & L. remarked, that railway was "playing the part of jackal" to these gigantic corporations, and two-thirds of that gross annual sum of three and a-half millions thus went into the coffers of these "foreign" companies. In these facts we find the spur that goaded on the M. S. & L. to do great things, and to attempt the invasion of London, despite the

reached Annesley, some ten miles north of Nottingham, and the Metropolitan had powers to Quainton Road, thus leaving a gap of ninety-eight miles to be bridged over by the contemplated extension to London. The proposals for this extension to Quainton Road, and for running powers thence over Metropolitan metals to West Hampstead, and thence by a new line through St. John's Wood to a London terminus in the Marylebone Road were brought before Parliament in the Session of 1891, and were defeated. A new Bill was prepared for 1892, and was fought through both Houses, finally obtaining the Royal Assent in 1894. Since the autumn of that year the line has been under construction, and has cost in all very nearly seven millions sterling.

All this expenditure and this now triumphant energy have been put forward almost solely with the object of securing a share of the great coal traffic to London. This policy would make the early railway managers gasp, could they revisit the scenes of their former activity; for there was a time (incredible though it may now appear) when it was considered to be beneath the dignity of a railway company to carry coals. Indeed in its early years, when it was the "London and Birmingham," the London and North-Western Railway actually re-

large central archway for vehicles. From the end of these cloisters the grand staircase winds up to the central hall and class rooms, at the foot of which a door leads into the masters' room. The playground underneath the building is about 76ft. wide by 70ft. long, with arched ceiling, and provided with drinking fountain. The heating and ventilating have been carried out on the most modern and approved principles, by Messrs. Rosser and Russel, and the furnishing of the class rooms, science room, &c., has been carefully executed by the Educational Supply Company. The architectural style of the building is late scholastic Gothic, and the materials used are Patent Victoria stone and red brick, the carving to the stonework being executed by the well-known sculptor, Mabey. Internally the woodwork in the class rooms is pitch pine; the hall has a handsome, open-timbered roof of Sequoia wood; all the floors are fireproof, and are finished with wood blocks, by Messrs. Bewick, Ward and Co. The painted-glass was executed by Chas. Evans, the builder being Mr. F. Potter, of Horsham. The large window in the hall contains eight medallions with the arms of England and her various colonies. The architects are Messrs. J. Kingwell Cole, and Kenneth Wood, A.R.I.B.A., 17, Hart Street, Bloomsbury, W.C.

THE PORTE, DORDRECHT. DRAWN BY H. F. WARING.

## THROUGH HOLLAND.

BY H. F. WARING,

*Architectural Association Travelling  
Student, 1898.**(Continued from page 36.)*

AMSTERDAM, the next town visited, is certainly the embodiment of one's preconceived idea of a typical Dutch city, and after the quiet of Haarlem, it was quite strange to see the bustle and movement continually going on, and to hear the continual clanging of the tram bells, the strange and weird cries of the street vendors, and the old quarter chimes from many a clock tower. The town originated at the beginning of the thirteenth century, when Gysbrecht II., Lord of Amstel, built a castle here (1204), and constructed the dam which gave rise to its name. The older part of the city is in the form of a semicircle, the diameter being formed by the River Y. Canals intersect the city in every direction, and divide it into ninety islands, which are connected by means of nearly 300 bridges. Most of the houses are constructed on foundations of piles, a fact which gave rise to the jest of Erasmus of Rotterdam—that he knew a city whose inhabitants dwelt on the top of trees like rooks.

Among the most interesting buildings may be mentioned the Oude Kerke, erected in 1300, and the Nieuwe Kerke, a late Gothic cruciform structure with ambulatory and radiating chapels erected in 1408-70. The old Weigh House, which was built as a town gate in 1488-1585, and was long used by the different guilds, is worth a visit. The Royal Palace—a severe, though very effective building of grey stone—was begun by Joc. van Kamper in 1648 as a town hall. It was furnished in 1655, at a cost of eight million florins. It rests on a foundation of over 13,000 piles, the length being 264ft. and width 207ft., whilst the height of the tower is 187ft. It was presented by the city to King Louis Napoleon as a residence in 1808. The gables are enriched with carving by Artus Quellin the Elder, celebrating allegorically the glories of the great commercial city and “queen of the seas.” While in Amsterdam, a visit should certainly be made to the Ryks museum, as besides many interesting old mantelpieces and doorheads, some excellent pictures may be seen, and the Ecclesiastical department illustrating the development of Ecclesiastical Art in the Netherlands from the Carolingian period, through the Romanesque, early Gothic and late Gothic periods, to the seventeenth century, is certainly instructive. The rooms here are vaulted like churches, and each mode

of vaulting is ornamented in the contemporary style.

From Amsterdam, a delightful voyage may be made by boat to the isle of Marken, which, however, has more interest for the artist than the architect. The island is inhabited almost exclusively by fishermen, whose quaint costumes with those of their wives are worth travelling many miles to see. Again taking boat we reach Hoorn in about two hours, and the journey is certainly very pleasant, as one passes many of the old dead cities of the Zuyder Zee. Upon approaching the town the Porte stands out in a most picturesque manner. This was built in the sixteenth century, and, as far as the Architecture went, compared very well with any thing I had as yet seen. The Stadhuis also attracts notice, and some panelling here is very good. This small town has produced several eminent men, among

whom may be mentioned William Schouten, born in 1580, who discovered the passage round the south coast of America in 1616, and named Cape Horn after his native town. J. P. Coen, born 1587, the founder of the Dutch dominion in the East Indies was also a native of the town. Before leaving Hoorn notice should be taken of some stone and brick gateways at the north-east of the town.

Ten miles north of Hoorn is Enkhuizen, which is reached after a ten-mile drive. The country passed through is more interesting than that of the south, whilst the peasant class seems to be in a state of much prosperity, which they have shown by erecting gaudy wooden houses, in many cases surrounded by moats with miniature drawbridges. Enkhuizen, now only numbering a population of 6300, formerly boasted 40,000 inhabitants, and this is not by any means an isolated case of a great decrease in the population of a town. It is difficult to account for such a falling off. The remains of the old fortifications in the Dromedaris Tower may be seen, and the Zinderkerk, built in the fifteenth century, has an interesting tower. The rood-loft (1542-73) of the Weslerkerk is perhaps the finest of the kind in N. Holland, beside the church is a detached wooden belfry dating from 1519. It was here that rather an amusing incident occurred. I had run out of the Dutch money, and, having only English coinage, tried, without success, to purchase some photographs; the shopmen at three establishments seeming quite at a loss to know what a sovereign was. On reaching Hoorn the next day, where I had left my baggage, the landlord asked me about the trouble I had experienced the previous day, at the same time translating a paragraph from a local paper, which stated: “A young Englishman, luckily without success, endeavoured yesterday to pass off a brass coin,” &c. Apparently the end might have been a good deal more serious than it turned out.

Alkmaar, close by, is well worth seeing, and if his visit can be arranged for market day (Friday) the traveller will be fortunate. The whole of the picturesque market place is covered with cheeses of a brilliant orange colour, and these combined with the gaily coloured country carts and quaint costumes of the peasant form a picture not likely soon

A WHARF, DORDRECHT. DRAWN BY H. F. WARING.

GABLE, HOORN. DRAWN BY H. F. WARING.

to be forgotten. The Church of St. Lawrence, a fine Gothic building (1470-98), with lofty timber vaulting, repays a visit, and some finely-carved Renaissance choir stalls will be noticed. The tower of the church fell in the fifteenth century, and has never been rebuilt.

Two places now remained which I particularly wished to visit—viz., Delf and Dordrecht. The former, once so famous for its pottery, is a charming old fashioned town of 32,000 inhabitants. It was almost totally destroyed by fire in 1536, and in 1654 it was seriously damaged by the explosion of a powder magazine. There are, however, numerous buildings of interest still existing. The new church, built in 1831, is an imposing building and possesses a remarkable monument to William of Orange in black and white marble. There is also a monument to Van Tromp, who conquered the English fleet in 1652. Immediately opposite the church is the Prinsenhof. Here was the scene of the death of William of Orange—known to history as the Silent—founder of Dutch independence, who was assassinated on July 10th, 1584. The Prinsenhof was previously a monastery, but is now fitted up as a museum. The place where the tragedy took place is still pointed out and is marked by an inscription. The Stadhuis on the west side of the market place restored by H. de Keyser after a fire in 1618 has some good pictures, and is in itself interesting to the architect.

Taking train to Rotterdam and from thence steamboat up the river, Dordrecht, after one and a half hours' most pleasant journey, appears in sight, and one is struck by the fine large tower of the Groote Kerke and the graceful Porte dome, both of which stand out in a very pleasing manner. The town in the middle ages was the wealthiest commercial city in Holland, and now numbers about 36,000 inhabitants. It was founded in 1018 by Count Dietrich of Holland. In 1572 the first assembly of the Independent States of Holland was held here. From November 13th, 1618, till May 9th, 1619, the famous Synod of Dort held its meetings here, which were attended also by deputies from England

and Scotland. It is historically remarkable for the unsuccessful siege by Jan, Duke of Brabant (1418), the great inundation of 1421, Jan van Egmond's attempt to surprise the town (1481), and the Dutch Synod (1618). Dordrecht is situated on an island. Before the above-mentioned inundation took place it was connected with the continent at Brabant, and was founded by the Count Dirk III. in 1008. To the north it is confined by the rivers Merwede and Oude Maas. Westward of the island runs the Dordrecht Kil—the way to the North Sea. The other side is occupied by the Nieuwe Merwede, running along a row of small islands covered with rushes, and it is these rivers, with their ever varying scenes of shipping, that make the place so attractive to the artist as well as architect.

The Porte already mentioned faces the river, and is built of red brick, and richly adorned with heads, lions, and escutcheons of sandstone. The centre of the decoration is formed by a large medallion representing the figure of a maiden surrounded by a hedge, and emblematical of the town of Dort. Around the medallion the coats of arms of those towns that joined the banner of Dordrecht in the times of the Counts of Holland will be seen. The arch and columns which flank the entrance of the gate were built in the eighteenth century, as was also the cupola. The building itself was erected in 1618. On the land side the gateway has the character of a stately, richly adorned Renaissance façade; along the windows rise Doric and Corinthian pilasters, cartouches and heads of angels appear here and there, and over the entrance the arms of Dort are carved, crowned with a large bust. The building is now used as a museum, and contains much of interest; amongst other objects, a carved stone mantelpiece attracts attention.

The Groote Kerke is, perhaps, the most important building in the town. This is a Gothic building of the fourteenth century, and is of red brickwork and stone combined. The tower, which is considerably out of the perpendicular, is well proportioned, and it relies more upon these proportions than upon its details, which are coarse, for its fine effect. The very excellent choir stalls, executed in 1538-40, will interest the student. On the wharves and quays some interesting warehouses stand, testifying to the town's former importance and wealth, whilst some stone houses with curious traceried window heads and wrought iron stay bar ends call forth admiration.

Owing to the fact of the town being built on a foundation of piles, many of the houses lean towards one another on opposite sides at a fearful and wonderful angle, owing to these foundations having sunk, and it is nearly incredible that the chief director of the museum should have explained they were thus built to keep off the rain from the walls.

Though the mediæval buildings throughout Holland are so good in design, and of so much interest, the art of building, at least as far as the design goes, has not descended to the architects of the present day; their construction, however, throughout the country was excellent, and I saw no sign of the jerry builder. The student goes, however, to this country to study design, and surely he will be delighted with what he sees, for where else will he find such simple well-proportioned, and at the same time, such effective treatment of buildings as in some of the old, and in many cases, rapidly declining cities of Holland?

**The Portrait of the Lord Chief Justice** (Lord Russell of Killowen), attired in his judicial robes, which is being painted by Mr. Sargent, R.A., is now approaching completion, and, it is expected, will be ready for exhibition at the Royal Academy in May next.

**A Beautiful Oak Screen** has been erected, at a cost of about £400, in the chancel of St. Mary's Church, Mortimer, near Reading, in memory of the late Mr. Richard Benyon, of Englefield House, Berks. It was designed by Sir Arthur Blomfield and dedicated by the Bishop of Oxford.

## MARBLE DECORATION.\*

BY ARTHUR LEE.

AN eastern traveller once said that until he went to India, he did not at all understand the artistic beauty of marble. As he spoke, he had before him the magnificence of the Taj Mahal, the most priceless and wonderful monument in the world, raised by the Emperor Shah Jehan to the memory of the wife. The Makrana marble of which the Taj Mahal is built, looks its best under the gilding of the Indian sun or lit up by the softer rays of the moon in the marvellous manner which can only be witnessed in eastern climes. It is under such circumstances a highly crystalline substance like marble obtains an added charm. Centuries before the building of the Taj Mahal, long before it was said of a Roman Emperor that he found Rome of brick and left it of marble, the Indian workers had attained a high degree of skill and it was probably through Eastern influence, by way of Persia and Greece, the Romans obtained such a strongly pronounced taste for marble decoration. The importation of marble into ancient Rome must have been enormous, for during the whole of the Dark Ages, and down to comparatively recent times, Rome was the marble quarry of the world. Some of the early popes are said to have destroyed more Roman buildings for their churches than the Goths, the Huns, and the Vandals put together. One of the earliest examples of this traffic is probably the Baptistry of St. John, in Florence, although some authorities are of opinion that this building is more directly of Roman origin. Many of the columns and the marble used in the mosaics at the Church of St. Miniato, also of Florence, are undoubtedly of Roman origin. It was in the eleventh century that a custom grew up that has more or less been practised in Italy of decorating the walls of buildings in bands of striking contrast. Knight puts this custom down to Saracenic influence. The Cathedral of St. Marks, at Venice, is one of the richest illustrations of marble work in Europe. It contains more than 500 pillars of Verde Antico, Porphyry, Serpentine, and some of the rarest marbles. Exterior and interior, ceiling and pavement are encrusted with rich materials. All that is not gold or bronze or mosaic is covered with the choicest marbles. One of the best known pieces of marble work in the Ducal Palace is the celebrated Giant's Staircase, a fine piece of fifteenth century work.

It is perhaps unfair to compare work of this kind with that which passes for decoration in some most pretentious buildings in this country. The owners of a fashionable London theatre only recently proudly stated that they are the possessors of "the best imitation marble set up in this country," and to crown it all "many competent judges have been deceived by it." One can imagine the criticism of the author of "The Stones of Venice," whose opinion upon such kinds of work was once forcibly expressed.

At the seat of Earl Spencer, at Althorp, in the entrance hall there is an excellent specimen of what can be done with simple white marble. Another is to be found in Mayfair, at the house of Lord Burton, where the staircase is of Sicilian and the hall is paved with the same material relieved with bands of Dove. Gosford House, the seat of the Earl of Wemyss, was originally designed by the Brothers Adam, but it was left to an architect of our time, Mr. Wm. Young, to convert it into a beautiful palace on the Firth of Forth, and to erect the charming marble staircase which is its chief feature.

Numidian marbles all take a high polish, and many of them are of singular beauty. In ancient times, they were greatly prized by the Romans, but after the fall of the Empire, the sources of supply were lost sight of, and these have only recently been re-discovered. Colonel Playfair, H.B.M. Consul at Algiers, is of opinion

\* Abstract of a paper read before the Bristol Society of Architects, on February 15th.

that the Roman Emperors carefully guarded the secret of these quarries, and that only comparatively small pieces were taken away. They were probably worked up into mosaics or used for other fine decorative purposes. Swiss Cippolino has been used in the marble decoration of the pump room at the Clifton Spa. The quarries are situated in Switzerland, and a large capital has recently been sunk in opening them out, in making roads, and laying down plant.

It is well to bear in mind that the beauty of coloured marble is seen to the best advantage in plain surfaces, and we ought generally to abstain from enriching mouldings with carving. In many of the darker marbles the effect of colour is so overpowering as to practically obliterate the forms of moulding executed in them; but whether light or dark marbles are used in mouldings, they should be unicoloured and free from markings and veins, which destroy the effect of mouldings by crossing them by inharmonious lines. It is a pity that Irish marbles are not more generally adopted. A beautiful green marble is obtained from quarries near Recess, Co. Galway. It is serpentine, like the green marble of Genoa. Repeated attempts have been made to establish the quarrying industry in Galway, but the want of appreciative demand has hitherto been always in the way.

## ENGLISH CHURCH ARCHITECTURE.

By H. A. PROTHERO, M.A., F.R.I.B.A.

**O**LD CHURCHES (and it is mainly about old churches that I shall speak to-night) may not interest everybody, but they are "common objects of the country;" and it is just as well for all of us to know something of the things that we see every day in the course of a walk or from the windows of a train. A hedge is more amusing to one who knows cranesbill from stitchwort, a lackey caterpillar from a Tussock; or a field to the critic of the points of horses and cattle; and so on. In this country you cannot go far without seeing a church, and in country places, at any rate, however new and spruce it may look, it is in nine cases out of ten an old one. Other buildings or monuments there may be which are older still—Roman walls and pavements, or camps and Celtic sepulchres. Again, there are castles of the time of Rufus, Stephen, or the Edwards; but these are comparatively scarce, and most of them, after serving their purpose for a time, were destroyed or went quickly into disuse and ruin; whereas most of our churches from the time they were built have remained

**Continuously in Use,** adapting themselves to changes without losing their identity. That is their great and unique interest, and is the key to their history. There is no other class of buildings of which the same thing might be said to at all the same extent. Compared to the periods of Geology of course "a thousand years is but as yesterday;" but in what is generally called the history of our own country, it is a longish time, and covers most of the events which are learned in our earlier days from Mrs. Markham, or Hume, or Froude; and unlearned, a good many of them, since, on what seems to be better authority. All round us are hundreds of old churches which have silently witnessed, some the whole, all the greater part, of that thousand years; and through it all have never gone out of human occupation for a year, or, perhaps, a month, or a week; possibly not for a day. If the "Stones could cry out," and tell us all they know, we might begin our learning and unlearning over again. To deal with

### A Huge Subject

like Church Architecture in a single lecture is beyond the powers of any man, unless he is so

\* A lecture delivered at the Municipal School of Art, Manchester, on Feb. 15th.

short of facts that an hour or so will tell all he knows, so I am going to pass rather lightly over ground which is probably more or less familiar to an audience like this; such for instance as the rise, development, or decay of Styles; the growth from wooden constructions to plain stone ones (which often retain woodenness of form), from the simplest round arch, through the more elaborate forms, to the pointed arch and the various developments of Gothic Architecture; and I shall deal

of any value, comes from—or is more or less suggested by—that pamphlet. Many people looking at an old church think that as they see it now so it was built; but on that point the stones *do* cry out and say "No!" Topsy, in Uncle Tom's Cabin, in reply to a question as to whence she came, replied "I guess I grewed." It is the steps by which our churches grew, according to pretty fixed laws of development, that I want to put before you. Now for just one preliminary statement

FROM THE MARKET PLACE, HOORN. DRAWN BY H. F. WARING. (See p. 67.)

mainly with what is certainly a less familiar though I hope not less interesting subject, that is the

### Ground Plan and Construction

of our churches, and how they came to be what we now see them. The idea was suggested to me by a chance remark of Mr. W. L. Newman, whom some of you may have heard of as a great Aristotelian scholar. He said to me during a country walk: "I often wish someone would tell me how old churches grew into what I now see them." The answer to that question is better contained in a pamphlet by my friend, Mr. J. T. Mickelthwaite than in any other work known to me; and most of what I shall say to-night that is

which I ask you to bear steadily in mind, for it is at the bottom of the whole subject, it is this:—*That the plan of a building is dictated by the use to which that building is put.* It does not matter what the building is. In the case of churches the use may vary somewhat. Some were intended solely or chiefly for Mass or Holy Communion with a small congregation; some for large choirs or cathedral establishments; some for monastic bodies; some for colleges; some for large audiences to hear sermons. Whatever they were for, they were planned accordingly.

### The Origin and Development

To come now to the consideration of how our church plans originated and developed,—

I shall begin by quoting Micklethwaite—He says: "Just as the Church of England traces her origin partly to the ancient British Church existing in the land before the coming of the Saxons, and partly to the Roman Church through the mission of St. Augustine at the end of the sixth century, so the buildings in which she worships show evidence of having been derived from the same two sources. We cannot indeed often say that a church is purely Celtic or purely Italian, for the two traditions existing side by side affected each other, and even became mixed; but even in those built at the present time we can trace their influences, and point out features derived from each." That is my text, and it lays down the proposition that our churches are descended from two distinct lines of ancestors, and that most of them present to this day features derived from their two pedigrees.

### The British Type.

To take now the British ancestor first:—As far as I know there remains no church in England dating back to the time before the landing of Augustine (whether or no there may be some in Ireland and Scotland). Most of them were probably of wood, and from various causes they disappeared; but the type, which is unlike most foreign types, is found in the few still standing which were built before the Norman Conquest, and it is the type which has been followed for quite small churches from that day to this. These little churches consisted practically of two rooms, with a doorway between them, so narrow that you can hardly call it a chancel arch. The finest specimen is at Bradford-on-Avon. It is of unknown date, before the tenth century anyhow, probably long before. It consists of a tall aisleless nave and a very small chancel, square-ended as the British church perhaps always was, with a round-headed opening between the two. It has also, what most of them have not, a porch.

### The Basilican Type.

That is one parent stock; and before going on to describe how it developed, I must go outside England to say something of the other, to which are mainly due our larger churches, cathedrals, and abbeys. This was the *Basilica*—the law court of the later Roman Republic and of the palmy days (financially palmy at any rate) of the Empire. Whether the Roman church on emerging from upper chambers and arenas, deliberately copied the Basilica; or whether in the fourth century she actually came into possession of any of them, I don't know. But in general plan and arrangement, exactly what the legal Basilica was in the time of Nero, the Christian Basilica remains in the time of Leo XIII. without any alteration worth speaking of. Basilicas seem to have appeared in Rome after the fire in 210 B.C.—before which Livy says: "neque enim tunc basilicae erant." They were borrowed of course from Greece, where the *στοὰ βασιλική* was the porch in which the *ἄρχων βασιλεὺς* sat to adjudicate on religious matters.

### The Roman Basilica.

In Rome there were at various times about twenty of them; and the perfect form was a quadrangular hall, at least twice as long as broad, with rows of pillars forming aisles with galleries above, and an apse at one end or both. Round the apse sat the judge and his assessors, the prætor's curule chair being in the middle of the curve. In front of him, under the chord of the apse, was the altar on which the judges swore; and this part of the building was partly raised off by latticed screens called "cancelli." The Christians thus found their churches ready to hand. The nave held the general congregation—mostly the men, the galleries accommodated the women (an arrangement still adhered to in some parts of Europe, also in synagogues), the bishop took the prætor's chair, the clergy the benches of the assessors, the readers and singers occupied the places of the advocates below the tribunal, and the altar remained where it was in the middle of what now became the choir, fenced from the nave by the cancelli. When Augustine came to England, that was the

type of church he was accustomed to; and how little it was departed from can be seen by comparing the plan of the Basilica on the Palatine, which never was a church at all, with the original pre-Norman Cathedral of Canterbury.

### Development of the Bradford Type.

I shall now go back to the simple chapel of the Bradford type, and show very shortly how this type developed, until it became, in large parish churches, something nearly akin to the foreign basilica. The first step was taken not long before the Norman conquest. A good deal of money must have been spent on Churches, and Queen Emma brought over foreign ideas from Normandy, where Architecture had taken a lead which England could only follow at a distance. The chancel arch widened, and the small square-ended Sanctuary (at any rate after the conquest) grew pretty commonly into a chancel with an apse at the end. I shall say more about apses further on, and will only point out now that the apsidal form is on the whole foreign, and that though there was for a time a general tendency to adopt it in England, that tendency in the long run gave way to a sort of insular prejudice in favour of the square end. As an extreme case of apsidal form in foreign churches I may quote the queer little church at Querqueville, overlooking Cherbourg Harbour, which with a tiny nave and small apsidal chancel and transepts has exactly the ground plan of the ace of clubs.

### Towers and Transepts.

Another change which comes in this period is the appearance of towers, sometimes at the west end; more commonly on two cross arches at the entrance of the chancel. This was before the cross shape was thought of, and the plan was still a simple parallelogram, with a tower in the middle, a plan of which one notable example is Ifley, near Oxford. Before long transepts of some sort began to appear; rather rudimentary, and not opening into the church at all, as I believe is the case with the very curious old church in Dover Castle. But the opening into the church soon followed, and the regular cross shape at once became so popular as to be almost universal for churches of any size. This is really one of the most curious and least known things about our old parish churches, that, though most of them have now lost their cross shape, and their towers, as a rule, no longer stand in the middle, but at one end; yet they retain to this day traces of their older plan of a plain cross with a tower in the middle. The occupants of these

### Cruciform Churches.

when the population grew and more accommodation was wanted, found themselves in a difficulty about enlargement. They could not adopt heroic measures and begin over again, and indefinite elongation of the nave was inconvenient, so they generally knocked out the north wall of the nave, and built a narrow aisle opening into it by an arcade, and into the transept by an arch; and later on, when need arose, they did the same on the south side, making the aisle a little wider this time. These narrow aisles were sometimes part of the original building in Norman times; more commonly additions, but whichever they were, they, in their turn, became inadequate, and in the fourteenth century they were very commonly pulled down and wider ones built instead (sometimes wider than the nave they flanked, as at Great Yarmouth, Cheltenham, and elsewhere); and at the same time the comparatively short Norman sanctuaries gave way to larger chancels, a change which one connects with a change in the services; the older sanctuary being for the Communion Service, or Mass only, while the new chancel was wanted for clerks and others who said publicly the services of the Breviary, now adapted in the Morning and Evening Services of the Church of England.

### Origin of the Clerestory.

There were two main results of this wide aisle building. One was that the side windows were

pushed out so far that the nave became rather dark, so a clerestory was built over the nave arcade and often developed into an important feature. Where no clerestory was built you sometimes find (as at Newport in Monmouthshire, and Overbury in Worcestershire) the Norman nave bottled up by large later aisles, so that the old small clerestory windows open, not into the open air, but into the aisles beyond.

### Why Central Towers Disappeared.

The other result is an odd, but quite natural one:—The aisle builders had opened their wide aisles into the transepts by wide arches, consequently the twelfth century towers, which had stood securely on their cross walls, lost much of their support, and in most cases tumbled down, the result is that central towers are now comparatively scarce in parish churches, though of course a good number are still standing. Another thing, by the way, which weakened towers was the custom of cutting "squints" through their supports, by which people in aisles or transepts could see into the chancel. It is a common idea, I believe, that the people did not hear, see, or know (were not in fact allowed to hear, see, or know) what was done in the chancel; but having no time for theories I can only point out the fact, visible all over the country, that when the old people had a Tower or a narrow arch in their way, they cut such a lot of peep-holes all round it that in the end it very commonly fell down. As a rule, when the fourteenth century people found that their Towers were down they no doubt talked it over and agreed that their old central Towers were rather inconvenient and blocked the church, and as they were down they would not put them up again in the same place, but build a steeple at the West end, where it would do just as well and interfere with nobody. This was about the time of the Black Death, and of a generally troubled state of things in England, so that the country was not much in the mood for building. They patched up the churches where the fall of the old Towers had wrecked them, but left their new Towers until they felt in better spirits. Consequently for a time

### Towers were scarce.

The old ones had tumbled down and the new ones were not built. However, after a bit they built their new ones, and they seem generally to have built them detached from the existing west ends, and joined the two later, so that the building of the tower should not interrupt the services. Perhaps this is a convenient place to answer a common question—Why are so many old churches askew?—The chancel not on the same axis as the nave. Many pious and fanciful reasons have been given, but Micklethwaite points out that as one part of the building continued in use while another was being built, and as the builders had no very accurate instruments, they often got a little off the lines, which is a prosaic, but doubtless true, explanation. By this time, as you see, the cross shape was nearly lost, and when the fifteenth century people carried on aisles or chapels east of the transepts, it disappeared outright, and the

### Church became a Parallelogram;

but—and this is an important point—if you look carefully in one of these late parallelogram churches for earlier work, in the place where *a priori* you would expect to find it—i.e., at the west end and the extremities of the transepts—there you will often find it in the midst of its earlier surroundings. Having traced the development of the parish church from the simple Saxon and British type to something which in the end resembles the Basilican plan, I will now only say a word or two about the roofs, which is such an important feature of late churches. Foreign churches, even small ones, were and are much more commonly groined in stone than ours are. In England, the usual thing was a wooden roof, which, in the fifteenth century, especially in some eastern and south-western countries, became one of the glories of the building.

(To be continued.)

# Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

## ARCHITECTURAL EXHIBITS AT THE ACADEMY.

To the Editor of THE BUILDERS' JOURNAL.  
 DEAR SIR,—May I ask if you can kindly tell me what are the rules for framing architectural drawings for the Royal Academy. Are gilt frames necessary?—Yours faithfully,  
 Clifton. J. B.

The Royal Academy publishes a list of conditions to be observed by intending exhibitors. You should write to the secretary for this. One of the conditions is that gilt frames must be used.

## BOOKS ON MASONRY.

To the Editor of THE BUILDERS' JOURNAL.  
 SIR,—Could you recommend Books on Masonry, especially those which would be useful to R.I.B.A. students. See p. 253 I.B.A. Kalendar 1898-99. "One sheet of Diagrams of Constructive Masonry on Brickwork, such as arches or groined vaults with the projection of arch and vault stones."  
 "ARCH."

"Masonry and Stonecutting" by E. Dobson, price 2s. 6d., and "Practical Masonry" by W. Lockwood, price 7s. 6d., both published by Lockwood, and Son, are books that will suit you. Both give illustrations of vaulting and similar work sufficient for your purpose.

## ACETYLENE GAS.

To the Editor of THE BUILDERS' JOURNAL.  
 DEAR SIR,—Could you or any of your readers inform me where I could get full information with regard to acetylene gas? I wish to make use of it, if suitable, in a country house, but am somewhat ignorant of the rules to be observed in its application.  
 COUNTRY SUBSCRIBER.

Plymouth.  
 A pamphlet containing a good deal of information about acetylene gas and its manufacture can be obtained from the Acetylene Illuminating Company, 63, Queen Victoria Street, London. They, however, do not supply the gas generators, but only manufacture the carbide of calcium from which the gas is made. Probably your best plan would be to write, giving particulars of the extent of the installation you would require, to the Ideal Gas Company, 3, Tachett's Street, Blackburn, Lancs., or to Messrs. Thorn and Tiddle, 1, Tothill Street, Westminster.

## COST OF PUBLIC BATHS.

To the Editor of THE BUILDERS' JOURNAL.  
 DEAR SIR,—Can you give me the approximate cost of erecting a few baths for working-men in a manufacturing town (exclusive of land), to be of a substantial but economical character, and to include tank, porcelain baths, pipes and fittings, and caretaker's rooms? I thought we to reckon upon spending more than £100 per bath—say, £400 for four baths, £800 for eight baths, and so on, including all the above.—Yours truly,  
 £ S. D.

It is by no means easy to give a satisfactory answer to your question, neither are we quite certain whether you want a swimming bath as well as private slipper baths. In either case you can hardly calculate the cost at so much per slipper bath, as, however few there may be, there are always the caretaker's apartments, the laundry, the heating apparatus, &c., to be provided; so that there would be not much difference in the cost, whether you had ten or twenty. If you require a

swimming bath and, say, twenty to thirty slipper baths, you must calculate on spending from £7000 to £8000, and, as a general guide to the art of such buildings, you may take the price at about 8d. for every cubic foot in the total cubic contents of the building, including the engineering, which is an expensive item. If you only require slipper baths, you might be able to provide, say, from twenty to thirty, with caretaker's house, laundry, entrances, &c., for about £2500. It would hardly be worth while to build with fewer baths, as the cost of the necessary accessories would become out of all proportion to the bathing accommodation provided; but if you have very little money to spend, you might be able to alter, or add to, an existing house to give six or eight baths, and this might possibly be done for a few hundred pounds; but then you have either to buy the house or pay a rent. All such estimates as these are, however, rather wild, as you have to take into account the prices of local materials and labour, the nature of the site, and so many other unknown quantities.

## RAIN DRIFT THROUGH SOLID GRANITE WALLS.

To the Editor of THE BUILDERS' JOURNAL.  
 DEAR SIR,—Can you suggest a certain cure for rain drift through solid granite walls? The walls were battened to prevent damp striking through. The writer does not want to have recourse to external cementing if it

RAIN DRIFT THROUGH SOLID GRANITE WALLS.

can be avoided. Indurating solutions have not proved very satisfactory. BUILDER.  
 Birmingham.

If these walls are solid granite, and are not backed up with brickwork in cement (see Sketch C), it is most likely that external rendering with Portland cement and clean gravel will be the only certain cure. Before this is resorted to, careful examination should be made of the pointing, projecting courses, window and door openings. It often happens that pointing is of less value than it appears to be (see Sketch A). This may become cracked, and render it possible for rain to get behind and make its way to the mortar used for building. The window and door openings are also sources of weakness in many instances. Sketch D and Section D E show how cells are usually left hollow until a building is finished. Sketch F shows how the cell bed should be filled up, instead of the common method, as at G. The window and door frames should be thoroughly pointed and bedded. String courses and cornices and all projecting courses should be covered with lead well cap flashed. All joints should be raked out deeply, as at H, and well pointed with good material. All cells should be filled up underneath with grout if found hollow. A prod with a penknife will go through pointing, as at G. The inside may be dealt with by rendering the wall with Portland cement and gravel before battening

if the place is to be replastered. We do not think petrifying solutions are of much value in cases like these.

## FUMING AND POLISHING MAHOGANY.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you—through your enquiry column—inform me how the tone of colour on Chippendale furniture is obtained, as I am desirous of getting the effect on some new work. Is the mahogany fumed or stained? (I do not know whether the former has ever been tried on mahogany with any degree of success.) If stained, what stain should be used, and is French or wax polishing the best method to adopt.  
 "UNCERTAIN."

The "Chippendale" colour may be obtained by subjecting the mahogany to the fumes of the strongest liquor ammonia in an air-tight receptacle. The same effect may be secured by the use of a solution of potassium bichromate; but the application of any stain—though the easier method—has the corresponding disadvantage of swelling the grain of the wood. The colour of the new wood, and the exact shade required in the finished article will determine the time required for fuming and the quantity of ammoniacal gas required, also the strength of the bichromate solution; but any good polisher will be able, by the use of red oil and stained polish, to impart to the work any required tone, even if the preliminary

darkening has not been carried sufficiently far.

## WATERPROOFING BRICK WALLS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly tell me if there is any method of making a brick wall waterproof without affecting its appearance?  
 St. Alban's. R. G. E.

A couple of coats of boiled linseed oil, liberally applied, form a good waterproofing composition for application to exposed walls in order to prevent wet penetrating, but the colour of the brickwork is mellowed somewhat by this treatment. In the case of light red facings this mellowing may be rather in the nature of an advantage than otherwise; but if it is a *sine qua non* that the colour must remain unaltered "Colourless Zopissa Solution" (Granite Paint Company, Cross Street, Creek Road, Deptford, S.E.) or "Fluate" (Bath Stone Firms, Bath) might be tried; but it would be advisable to try the effect of either or all of the suggested treatments upon a sample brick or piece of walling before venturing upon the job as a whole. The walls should be pretty dry before anything is done as, otherwise, any contained moisture would be driven inwards.

[Several answers are held over till next week. Ed.]

## Correspondence.

### SOANE MEDALLION DESIGNS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—It is stated in your issue of Feb. 22, that one of my drawings, submitted in the recent competition for the Soane Medallion, is reproduced upside down in the issue of "The Builder" for Feb. 18th. I should like to state that the plan is placed therein in the only position in which it can be read properly with the section, and a person opening "The Builder"—the right way up—will see the plan as it was originally fixed to the drawing-board when it was being designed, and it was then certainly not upside down.—Yours truly, W. STANLEY BATES.

[We willingly publish the above letter and withdraw the suggestion that our contemporary has printed one of Mr. Bates' drawings upside down. It is evidently Mr. Bates' system of lettering his plans that is at fault, and our contemporary could not well have arranged them otherwise. Looking at the Longitudinal Section in the natural way so that the lettering reads from bottom to top the plan would be upside down; but this, says Mr. Bates is not the right way of the sheet. It follows then that we must read the lettering on the section one way—from top to bottom—and that on the plan the other way—from bottom to top. The point is a small one, but such an arrangement is obviously inconvenient. Ed. B. J.]

### STRAINS IN BEAMS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—As a teacher of Building Construction at the East London Technical College and at Croydon Polytechnic, I think I may be excused for pointing out some errors in Mr. C. W. Tomlinson's article, entitled "Strains in Beams." At the bottom of the first column we read: "The next thing is to find the amount of stress produced, or bending moment, as it is termed. In this appears the first blunder. Stress is by no means the same thing as bending moment. Bending moment, or leverage, is the cause, stress (i.e., the internal forces in the beam) is the effect, a fact which should not be mis-stated by anyone setting out to simplify the formulæ given in text-books. Again, bending moment is leverage, which implies distance and force, and is measured in tons-ft. or lb.-ft., &c. Now we find Mr. Tomlinson giving the stress or bending moment as 13.125 tons in the example (Fig. 5). The answer given is not stress, but bending moment, and should have been 13.125 tons-ft. Another serious blunder occurs in the rule given. The latter part of it reads: "The remainder will be the amount of stress at the given point." Here it should have been the magnitude of the bending moment, &c. To take the last example, we read: "Stress at X=72.1 tons." Clearly what should have been stated is that the bending moment at the section X is 72.1 tons-ft.—Yours faithfully,

ALBERT GRENVILLE.

DEAR SIR,—With regard to the alleged blunder at the bottom of the first column, I feel I cannot do better than quote my authority. Wilson, in his "Advanced Building Construction," p. 180, says: "To determine the strain or bending moment," thus implying they are one and the same thing.

For this reason I used the term strain (or stress), as being more familiar to students than bending moment, as the latter term is more usual in applied mechanics, and, on the same grounds, I expressed the magnitude of the strain (or bending moment) in tons, though I am aware it is more strictly correct to express the same in foot-tons.

All the alleged errors are based on this same question of terms.—Faithfully yours,

CHAS. W. TOMLINSON.

[Mr. Tomlinson is quite at sea in his use of the terms "strain," "stress," and "bending moment." We shall publish next week an authoritative note from an expert. Ed. B. J.]

## Keystones.

**A Science and Art Institute** is proposed for erection at Stourbridge, at an estimated cost of £7000.

**A Refuse Destructor** is to be erected at Paisley. The Horsfall Syndicate Limited are supplying a portion of the work.

**A drinking fountain** to be erected as a Memorial to the late Duchess of Teck will shortly be placed on Richmond Hill.

**The English Church of St. Mark, Assuan**, is now being erected. The Duke of Connaught laid the foundation stone on Feb. 27th.

**A New Railway Station at Finchley**, between Church End and East Finchley, is to be opened by the Great Northern Railway Company.

**A Band Stand** to cost £594 is to be erected in Battersea Park. The London County Council voted the money at its last week's meeting.

**The Alterations to Clerkenwell Fire Station** have cost £2,694 in excess of the estimates. The County Council have sanctioned the payment.

**The Architect of the London School Board**, Mr. T. J. Bailey, is to have his salary increased to £1100 a year, with a further increase is twelve months to £1200.

**A New Bank at Southsea** for Messrs. Grant and Maddison's Union Banking Company, is to be erected on the site of the old premises in Palmerston Road.

**A new hotel** erected by the Great North of Scotland Railway Company at Cruden Bay, has been opened. The decoration and furnishing have been carried out in sumptuous style.

**St. John's Church, Lowestoft** is being improved by the addition to the chancel of a new marble reredos, which was subscribed for as the local memorial of the Diamond Jubilee.

**The John Ruskin School**, in Beresford Street, Newington, built at a cost of £22,504, has just been opened. The site has cost an additional £7928. The school provides accommodation for 1138 scholars.

**The late Mr. William Roberts**, architect, of Manchester, has bequeathed over £23,000 for public purposes; £4500 is given for a statue of Mr. Gladstone, to be erected in Manchester. National charities also benefit.

**New Schools at Dumfries**.—A new elementary school has been erected in George Street by the Dumfries School Board. It is a handsome building, having cost (with the site) nearly £10,000. The architect is Mr. Crombie, of Dumfries.

**Fever Pavilions for Burnley**.—The Burnley Joint Hospital Board have decided to apply to the Local Government Board to sanction the borrowing of £15,000 for the purpose of building two new fever pavilions, and of paying the excess in expenditure over the borrowing powers on the Burnley and District Sanatorium.

**All Saints' Church, Thwing, Yorkshire**, is to be renovated at a cost of £2500. The old high pews are to be swept away, but the remarkably fine Norman chancel arch, south porch, and font are to be carefully preserved. A striking feature in the chancel is a monument of a priest in full vestments of ancient pattern.

**The Arts and Crafts Society of Ireland** purpose holding their exhibition in Dublin during November of this year. The Senate of the Royal University have again granted the use of their buildings, at Earlsfort Terrace, for the purpose of the exhibition. A substantial guarantee fund has already been subscribed sufficient to enable the society to complete their arrangements. Intending exhibitors should communicate with the hon. secretary, Arts and Crafts Society, 15, Kildare Street, Dublin, with regard to rules, regulations, and other details.

**The Temperate House at Kew Gardens** has had a second new wing added, and the whole of this splendid conservatory thus completed will soon be open from end to end. It lies up in the vicinity of the Pagoda, which disfigures the beautiful grounds of Kew on the Richmond side.

**The Albert Memorial Church, Harpurhey**, has just had a new parochial hall built close to it. The building, which will appropriately be known as the Victoria Hall, will be used for parish meetings, classes, and occasionally public worship. The cost of the hall has been £700.

**The Baker Street and Waterloo Railway**.—At its meeting last week, the London County Council approved the plans and specifications showing the mode of construction and the position and level of the two tunnels which it was proposed to drive under the Victoria Embankment to the south of Charing Cross railway bridge.

**A bust of Prince Charles Edward** the "Young Pretender," has just been added to the collection at the National Portrait Gallery. The bust, which is of bronze, is said to be an excellent likeness of the prince when he was about fourteen years old. It has been given to the trustees of the gallery by Dr. W. Aldis Wright, of Trinity College, Cambridge.

**The Royal Portsmouth Hospital** has had two blocks, comprising four wards, added to it, and these were opened by the Duke and Duchess of York last Monday week. The architects are Messrs. Young and Hall, and the contractor is Mr. J. H. Corke, of Portsmouth. Two other blocks are still to be added when funds are available. The cost of the additions has been £16,000.

**The British Fire Prevention Committee**, which was founded in 1897, has now become a fully incorporated scientific society, under the special sanction of the Board of Trade. The rapid development of the Committee is mainly due to the energy of its Executive, led by Mr. Edwin O. Sachs, and to the influence of its Council. Its scope is again being extended—another important section, dealing particularly with the safety of factories and workshops, having been formed.

**Restoration of Strood Church**.—The work of restoring St. Nicholas Church, Strood, Kent, after the recent destructive fire in the tower, is about to be taken in hand. The turret destroyed by the fire was out of harmony with the general character of the Early English tower—the sole remaining piece of the ancient Church—but it has been decided to adopt the battlemented parapet style in carrying out the restoration instead of the shingle spire of the original church.

**Inverness Music Hall**.—The plans prepared by Messrs. Ross and Macbeth, architects, for the restoration of the Music Hall, which was recently burnt down have been passed. The main walls and stone stairs of the old building, which are intact, will be utilised, and the hall will be reconstructed on the former model, with, of course, improvements, including an installation of electric light. The principal entrance and lobbies and landings will be widened by several feet, stone stairs will be extended to the galleries, and means of ingress and egress much improved. The total cost will be about £4000.

**The Cleaning of Cathedrals**.—"Londoner" writes to the "Morning Post":—"May I ask who is responsible for the cleanliness of our cathedrals? The present state of St. Paul's, dirty and begrimed, is beyond description, and St. Alban's and Westminster Abbey, with many others, are in the same plight. I was amazed to see the condition of St. Paul's both outside and in, a very picture of utter neglect, dirty, with what to all appearances were accumulations of long standing. My opinion is that the dirt and the grime are a desecration of the noble edifices. Thousands of pounds are given away in charity almost daily in this great metropolis, some of which is to the poor out of work. Why, then, can not these unemployed people be given labour in cleaning many public buildings?"

## R.I.B.A.

### EARLY CHRISTIAN CHURCHES IN PALESTINE.

A SPECIAL general meeting of the Royal Institute of British Architects took place last Monday evening, at 8 o'clock, at No. 9, Conduit Street, Regent Street, W., to elect the Royal Gold Medallist for the current year. Professor G. Aitchison was in the chair, and moved "that, subject to Her Majesty's gracious sanction, the Royal Gold Medal for the promotion of Architecture be presented this year to Mr. George Frederick Bodley, A.R.A., for his executed works as an architect." The motion was carried. The ninth general meeting (business and ordinary) was held at the conclusion of the above-mentioned meeting, and the minutes of the last meeting having been read, the following gentlemen were elected members of the Institute:—as Fellow, Samuel Perkins Pick (A); as Associates: Walter Hargreaves Bourne, William Alphonso Scott Ernest Jesse Mager, George Reavell, jun., John Henry Arthur Phillips, Arthur Maryon Watson, John Cubbon, Harry Inigo Triggs, Frederick Robert Hiorns, John Kirkland, Edward Frost Knight, Harry Dighton Pearson, Leslie William Green, and Henry Tanner, jun. As Hon. Corresponding Member: Professor Commendatore Felice Barnabei, General Director of Antiquities and Fine Arts, Rome. Mr. Henry Dawson's motion: "That, with the object of securing correct legal action in the election of candidates for membership of this Institute, the members thereof request the Council to obtain, at the earliest convenient date, the written opinion of some Queen's Counsel of independent position, as to

#### Whether Women are Eligible

as Associates or Fellows, under the terms and provisions of the existing charter and by-laws of the Royal Institute of British Architects. And that the Council do report such opinion to the members at the earliest convenient date" was lost by the casting vote of the chairman. Mr. Owen Fleming next moved "That the attitude of the Council towards the brickwork experiments conducted by the Science Standing Committee is calculated to impair public confidence in the Royal Institute, and that the Council therefore be invited to take such steps as may be necessary to bring the matter to a satisfactory conclusion." The motion was carried. Mr. H. Hardwicke Langston's motion, *re* a prominent inscription to be placed on the street front of the premises, indicating their occupation by the Institute, was held over. At the conclusion of the foregoing business a paper was read by Mr. A. C. Dickie, A.R.I.B.A., on "Some Early Christian Churches in Palestine," with lantern-slide illustrations. There was no discussion on his owing to the lateness of the hour, but written communications can be sent for insertion in the Institute journal. The following is a *résumé* of the paper:—

The lecturer said that Jerusalem was rich in remains of early Christian churches, and he had selected for discussion three interesting types of plans which were comparatively unknown—viz., those of the

#### Church of St. John the Baptist

(eleventh century), an Armenian mortuary chapel (sixth century), and the Church of the Pool of Siloam (fifth century). Before dealing with these, the lecturer briefly outlined the history and described the great cathedral church of the Holy Sepulchre, the most important and most interesting early Christian church in Jerusalem. Constantine, in the fourth century, built a basilica over the site of the discovery of the true cross by Queen Helena, and a rotunda over the Holy Sepulchre, which seems to have been separated from the basilica by a cloister. These were burned and destroyed by the Persians in 614, and partly restored by Modestus soon after, with the addition of a chapel over Calvary and a chapel to the Virgin Mary. Arculf (7th century) gives a plan of the building showing

the rotunda isolated, and between it and the basilica the chapel over Calvary and the chapel of St. Mary. The buildings were again destroyed and restored in the 9th and 10th centuries, and totally destroyed in 1010 by the Khalif Hakem. Not long afterwards they were restored, and in the beginning of the 12th century the restoration of the Crusaders made the church much as it is now seen from the housetops. The façade, with its domes and tower and the Mohammedan minaret in the foreground, is the most charming group of the city, the rich tawny colour of the weathered stone and the lead and white domes set in bright sunlight against the intense blue Syrian sky is a picture to be remembered. The lecturer acknowledged his indebtedness for the facts given of the church to the careful researches of Mr. George Jeffrey, a fellow of the Institute. The church of St. John the Baptist lies on the way to the church of the Holy Sepulchre, in Christian Street, adjacent to the Pool of Hezekiah.

#### Over the Original Church a Modern One

has been built, very nearly on the same plan, and the ancient building now takes the place of a crypt, the surface of the ground being at the level of the upper church floor. The lower church is reached by a rude flight of steps on the south side descending into a narthex, from which three doors enter the main building. The total length of the church, north and south, is 62ft. 9in., and width 24ft. 9in., which the later wall thickening has reduced to 16ft. 6in. The west wall of the narthex is 6ft. 10in. thick. The floor of the eastern apse is raised 6in., and the original window is now formed into a recess. The present vaulting is late pointed, the centre bay having intersecting vaults, and the flanking bays plain vaults. A close examination of the vaulting convinced the author that it had been constructed in the same way as the natives construct the vaults at the present day, viz., by a rude centering of timber, brushwood, and earth, modelled to the form of the vault, and then completed in concrete of stones and lime thrown quickly over the centering and left to dry. An Arab effendi, when excavating the foundations for a new house, came upon one of the most beautiful Byzantine floor mosaics yet discovered. He preserved it by building a cell on the old foundations. The mosaic formed the floor of an Armenian mortuary chapel, a tiny, rectangular cell, 21ft. by 13ft., with an apse on the east end. The lecturer quoted Dr. Bliss's account of the discovery, and a note by Dr. A. S. Murray on the design of the mosaic. Next to the Church of the Holy Sepulchre, perhaps the most interesting is the church dedicated to

#### The Waters of Siloam

in the middle of the 5th century. This long-lost ruin was discovered during the recent three years' excavations by the Palestine Exploration Fund under Dr. Bliss's direction. Having given a description of the Pool of Siloam and its present condition, and some account of Dr. Bliss's excavations, the lecturer went on to discuss the church itself. There is no record of any building attached to the Pool prior to the time of the Empress Eudocia in the middle of the fifth century. The sacredness of its waters to the pilgrims who sought relief from their infirmities at its healing stream inspired the Empress with the idea of building a place of worship over the Pool. The plan adopted is unique. It consists of a nave and two aisles, measuring over all 86ft. by 52ft. In the centre of the nave are four piers 4ft. 3in. square, the supports of the Byzantine dome of a later restoration. The projecting choir is also of the period of this later work, as well as the thickening of the pier in the entrance colonnade to the north, inserted evidently to provide for the extra thrust of the dome arches. There is no entrance in the west, and access is gained from the north by a great stair of sixteen steps, 68ft. wide, descending through an arcade of seven arches almost the whole length of the aisle. The staircase is reached by three doors, entering from an atrium, the centre doorway being accentuated by the addition of a small portico. Between

the doorways occur low stone benches set against the wall, used as seats. Ranged round the apse are five tiers of steps, with the centre raised at a higher elevation than the flanks for the seat of the bishop, as existing, more or less complete, at Torcello, illustrated by Fergusson. There is a small chapel in the east end of the north aisle, screened by a low screen of red marble 2in. thick, let into the sill and walls, and coped with a moulded coping stopped by moulded stone gate-posts in the centre, the remains of which were found lying at this point. In considering the influences which had worked together to bring about

#### The Peculiarity of Plan,

the lecturer explained that the church was designed to fit into an existing scheme, in the building of which no such extension was contemplated. At that time the pool was believed to be supplied by a spring, the builders being ignorant of the existence of the Siloam tunnel. The position of the supposed spring to which the church was dedicated, therefore fixed the position of the altar directly over the spot where the waters were believed to spring from, 27ft. below. This practically settled the eastern apse, and the west wall was fixed by the position of the rising scarp and city wall then existing, and forming the western butt of the great staircase, the necessity for incorporating the latter into the plan, forcing the builders to draw the wall to within a few feet of the scarp, leaving a space only sufficient for a narrow passage and a western light to the church. It was desirable to have as much of the church as possible over the pool, and this was easily managed by carrying the south wall on the pool arcade and the aisle colonnade on the north wall of the pool. Thus the north was the only side available for the entrance to the church, and although the rapidly rising ground rendered this difficult, necessity demanded it, and the magnificent idea of a great staircase entering the north aisle through seven arches (almost its whole length) was the result. The traditional three doors were placed at the entrance to the staircase, and an atrium put in front. Thus all the traditions of the early church plan were retained in a modified form—a most successful solution of an exceedingly difficult problem. An unsuccessful attempt was made to buy the site, with the intention of restoring the church and pool to its original state. Among the illustrations was a sketch restoration made by the lecturer, founded upon the theories advanced in his paper. A careful study of the existing remains leaves little to conjecture, as the buildings practically stand for a height of 35ft. from the pool pavement to the ruined top of the church walls. The Hon. Sec. proposed a vote of thanks to Mr. Dickie, and this was seconded by Mr. R. Phené Spiers. The vote was heartily carried. At the next meeting on March 20th, Mr. John Bilson, F.R.I.B.A., will read a paper on "Beginnings of Gothic Architecture: Norman Vaulting in England."

**A Statue to the late Lord Aberdare** was unveiled last week at the Howard Gardens, Cardiff.

**Municipal Trading.**—A memorial has been addressed by the Council of the Society of Arts to the Home Secretary with regard to the increasing tendency of municipal and local authorities to embark in trading enterprises which may be in competition with, or to the exclusion of, private enterprise, and to the fact that as yet no limitations have been defined as to what enterprises should in the general interests of the nation be undertaken by municipalities and local authorities, and what ought to be left to private effort. The Council ask the right hon. gentleman to advise her Majesty to appoint a Royal Commission to consider the whole subject, and to lay down the principles and limitations on which Parliamentary powers should be granted to municipal and local authorities, and submit that until the Report of the Commission no further powers for trading purposes ought to be granted to such bodies.\*

## PUBLIC BATHS.\*

BY A. SAXON SNELL, F.R.I.B.A.

IT is not my intention to go over the ground so ably traversed by Mr. Hessel Tiltman at an Institute meeting a month ago, if only because my paper might appear in some measure a mere *résumé* of his, and would lack interest to you. He describes the broad lines and the general disposition of public baths and washhouses. I have proposed to deal with the subject much more modestly and rather with constructive details. But one cannot approach the constructive details without some preliminary survey of the planning of these institutions; and if the remarks I have to make under this head are somewhat more lengthy than a preliminary survey might appear to warrant, you must ascribe it to the weakness of an enthusiast who cannot help airing his pet theories; and I have many with respect to the planning of public buildings. It is difficult to lay down hard and fast rules for the planning of any class of building in London, if only because of the restricted area and often extraordinary configuration of the sites which are chosen by enlightened public bodies; it would almost appear, with the idea of setting prize puzzles to aspiring architects. In most other countries

## The Best Sites

are always reserved for public buildings—in London for enterprising speculators. Generally in Continental towns nearly every public building of any importance is bounded by streets on at least two sides. If the architect gets one fairly good frontage in London he is lucky. But our very difficulties in this way stimulate inventiveness, and I venture to think that nowhere in the world can more ingenuity in planning be found, nor have greater triumphs been achieved in making the most of limited opportunities, than in this huge conglomeration of buildings called London. Given, however, a fair site, the least we can do in making our plan is to study carefully the uses of our buildings and the essential requirements of their administration, and then to concentrate all our attention upon so

## Arranging the Various Parts

of the building as to fit these requirements, and to render future administration as easy and economical as possible. It follows without saying that if we are architects in the most practical sense of the word, we shall be able to construct our buildings strongly, and clothe them in the most seemly array, and make even our difficulties yield opportunities for effective design. The word "economy" has been brought into contempt so often by its misuse in the mouths of these narrow-minded people with whom it is synonymous with "cheapness," that it is worth while to define our own meaning; the short form for which is arrived at by labelling it with the words "wise" or "true." In planning a building, then, to ensure or make possible "wise" or "true"

## Economy in Administration,

we mean arranging the various parts in such order as will enable those who administer it thereafter to do so with the least waste of human energy; and happy is the architect whose clients perceive the true bearing of this principle, and follow it to its logical outcome. It is only just to our clients, by the way, to say that it is largely recognised by them to-day, as can be shown by the lavish expenditure upon glazed bricks, majolica, and other surface decorations, the great first cost of which is so soon repaid by their permanence, and the small cost of maintenance. I need scarcely remind you that we, as architects, are much more interested in the first cost of a building than in its subsequent maintenance; and it is therefore also our interest to build well from the first. That is by the way; it does not benefit us alone. Indeed, our share is, comparatively speaking, small; the benefit to the client is far greater.

For it is obvious that if by our skilful planning we make it possible to administer a building with five servants, say, instead of six, we save our clients a subsequent expense—to take a low estimate—of £500 annually; a sum which capitalised could be expressed in buildings to the value of £1500 or thereabouts. Inversely, if by expending an additional £500 our client saves the cost of one servant, he is the gainer by £1000, and we—the architects—by £25. It ought to be the other way round, but let that pass. Those who, like myself, have had the privilege of going over the new baths at Shoreditch will agree with me that we are improving in our ideas as to what a public building should be. For some years our rulers have been

## Slowly Learning the Lesson

which we architects have endeavoured to teach them for many years; but they listened not to our voice, and even hinted that we advocated magnificence in our public buildings mainly because of the increased benefit to ourselves. But they begin to see now that money spent in buildings is not spent in the sense that it leaves us poorer, but rather that it is *invested*. They begin to realise that in no way can money be more widely circulated, or give a better return to the community, than in building. They realise that nothing is more educational to the lower stratum of human life than to house it decently, and to accustom it to better surroundings. The money spent in public buildings must be regarded as invested only—and well invested—we have but to point to

## Our Old Cathedrals,

buildings which are now priceless, and who shall estimate their educational effect, even at the present day? A little sign that the public are beginning to perceive these things is afforded by the growing tendency in competitions not to hamper the competitors by a fixed price. May the tendency grow into custom! Another is the custom of visiting other institutions to learn what is their best, and then to go one better. We of the younger generation of architects have a good time before us, and it behoves us to rise to the occasion, and endeavour to inaugurate a new renaissance in Architecture, not only in purely architectural features, in new methods of construction, in the use of new materials, and a better knowledge of the old ones, but particularly in our ideals of space and order. So we may foster the growing

## Imagination of Our Clients,

and lead them on to yet higher ideals, yet nobler efforts. In that day the architect may be honoured in the land, and always get his name mentioned (and spelt correctly) in the daily papers when they describe a building. I need not dwell upon the necessity of directness and simplicity of planning in public buildings. I remember, many years ago, hearing Mr. Aston Webb say, in effect, that one of the charms of domestic planning was what he described as "mystery"; and when we call to mind the rambling arrangement of some delightful old houses known to us all, we must agree with him. The very reverse obtains in the case of public buildings. The simpler and more direct our plans, and the greater the

## Proportion Between the Rooms

and passages, the better. These and many other rules are common to all buildings for public use, and it is my purpose now to apply them, especially to baths. To do so more effectively, I have thought it well to try and realise what one would do with a fairly unrestricted site for a moderate-sized establishment. Mr. Tiltman foreshadowed a different classification and distribution of baths in the near future, and his remarks upon this point were by no means the least interesting and suggestive part of his paper. Until these new ideals have been well ventilated, it is impossible to say in what form they will be best adapted to the peculiar conditions of our own country. Let me take you through a suggested model building, pointing out, by the way, the *raison d'être* of the various parts, and the principles I shall draw from it will, I believe, be applic-

able as much to future as to present-day planning. (The author illustrated his remarks by reference to a plan exhibited at the meeting.) It comprises three swimming baths, respectively for first and second-class men and women, and eighty private baths allotted to the two classes and sexes in the proportion laid down in the Public Baths and Washhouses Acts. We will commence with the entrance waiting-hall, which should always be the key to a plan. It is about 30ft. by 20ft., and undivided, entered from the public street by a short and wide vestibule. I have only one entrance, which you will say is unorthodox. So it is; it is usual to have

## At Least Two Entrances,

one for men and another for women. In many baths there are as many as four respectively for first and second men and first and second women. I hope the time is coming—and that soon—when we shall recognise that if it is not necessary to have separate booking-offices and entrances for men and women in libraries, railway stations, and other public buildings, it should not be necessary for public baths. When this is recognised, we shall do away with one of the most hampering restrictions there is in planning these buildings. The hours I have myself spent in endeavouring to design a pay office which should serve four separate entrances, and yet be decently lighted and ventilated, I feel sad to think of. Of course, when there is

## A Public Washhouse

attached to the baths, two entrances at least are absolutely necessary. In such a case I should, if possible, make the second entrance serve also for the second-class women's baths. I believe that ladies find it less objectionable to meet a rough class of men than the same order of women; a working man is much more likely to bear himself chivalrously before a lady than one of her own sex in the same class. The one entrance plan causes in some degree a smallness of the hall and corridor area compared to the size of the building. This result has practically been obtained at the Plaistow Baths, although the entrances are separated. Whatever may be said in favour of

## A Large Entrance Hall

(and I myself would have it of ample size) little can be urged in favour of corridors, especially long and tortuous corridors. They take up room, cost much to build, and more to maintain, clean, and overlook, and, to my mind, show weak planning. On one side of the vestibule is the superintendent's private office, and on the other a staircase to his apartments above. Except in quite small baths it is a mistake not to provide a separate office, in addition to the pay office. The pay office itself should be about 100 to 150 square feet (not larger), and fitted all round with shelving for towels and bathing drawers, &c. In an establishment of this size two pay windows are necessary. It is desirable for many reasons (not the least being that of commanding the entrances, &c., from all parts) that the front and sides should be glazed in the upper panels, with obscured glass to the height of 4ft. from the ground, and above with clear glass. Before leaving this part I may remind you that if you can afford any luxuries in the way of expensive fittings, joinery, pavings, &c., your clients will raise less objection to their use in the entrance hall than elsewhere. Public boards are very human—at least in their weaknesses. The superintendent's office should also always be close to the entrance, as many people come to see him who should not be allowed to pass into the building generally; 150 square feet is quite large enough. On either side of the pay office are lobbies and short corridors—the shorter the better—leading to the swimming and warm baths. The first-class men's swimming bath is placed centrally, with those for second-class men and for women on either side, the warm baths naturally being on the corresponding sides. The provisions of

## The Baths and Washhouses Acts

as to the proportion of numbers between the classes, make it very difficult to preserve symmetry in planning. Now, my reason for

\* A paper read before the Architectural Association on March 3rd, 1899.

being the first-class bath centrally is that in probability it would be convenient to alternate its use for first-class men and first-class women; and this may often be conveniently done, because ladies, I think, prefer to bathe, if at all, in the morning, whilst the men's baths are always filled up in the evening. It is also in a convenient position for use as a water-gymnasium, alternately for men and women. The shorter length of the second men's and women's swimming baths leaves room for the

#### Boiler House and Engine Room,

and the establishment of towel laundry, &c. These are not infrequently placed together, but it is not a necessary arrangement, and is, indeed, undesirable if women are to be employed in the laundry. The subway under the end of the first-class bath affords access to the engine room to the boiler house. If the site permits, these departments may be advantageously placed in the basement, but if we should never make the mistake of depriving them of light and air. A system of drains is almost essential in public baths, and if possible all main pipes for drainage and hot and cold water supply and heating should be fixed along their walls or ceilings, where they can be repaired or renewed without disturbance or injury to the rooms above. I may say that both at Marylebone and Plaistow, and also, Stratford, I have

#### Subways under every part

of the building. The superintendent's apartments will, of course, be placed on an upper floor over the front centre of the building; and one of the most important points to observe is to arrange the approaches so that the damp, warm air, which inevitably hangs about even the best ventilated baths, cannot find its way into the rooms. There are not a few superintendents who can speak feelingly upon this point. A small area or a way out on to a flat is very desirable. It is usual to provide about 100 sq. ft. of room, and they should not be too small. It is not the most enviable existence to live and work all day in the atmosphere of public baths.

#### The Swimming Bath.

The general arrangement of a swimming-bath is so simple and too well-known to need much description. It is invariably a large hall, enclosing a bath, the essential point of which appears to be that it should be as big as circumstances will allow. This is surrounded on all sides by a pathway or platform, as it is called, and a number of dressing-boxes are ranged along each wall. With respect to the bath itself I do not myself advocate a water length than 100ft., and a very good bath for this length is from 30ft. to 35ft. In deciding upon the dimensions of a bath we have to bear in mind that water costs in London above 6d. per 1000 gallons (often much more and seldom less), and if a bath is heated and filled only three times a week, the expense is heavy if the size is greater than need be. Of the three dimensions, the length should place first in importance the length, and next the depth and width. One of the most popular uses of a good bath is for swimming race-course, and as the unit of length in races is always the yard, and the dimensions mostly multiples of 100, it is, I think, acknowledged by swimmers that 100ft. is a convenient length for a racing bath. The lengths go to the 100 yards; twenty and thirty yards are easily measured off. The water depth should vary from 3ft. 6in. to 5in. or 7ft.—in second class baths 3ft. to 4ft. the latter being used far more by boys and grown men. Theoretically, the deepest of the bath should be about 10ft. from one end, because that is where a high diver d, generally speaking, strike the water.

#### The Level of the Water

It should not be less than 12in. below the footway and this level is maintained by the overflow-trough, which it is usual to place along the wall at the deeper end. This overflow has variously contrived with an iron projecting gutter, a series of holes, or a sunk channel hidden by a flush brass or iron grating.

The best form I have seen is that adopted at Shoreditch, which is a large moulded trough, made in long lengths of majolica. For neatness of appearance, and also, I fancy, economy, Mr. Tiltman's white glazed sunk channel is nearly, if not quite, as good. A small modification would improve it. In the most usual form of bath tank, the walls are constructed of cement concrete built battering on the outside, but I prefer brickwork in cement, carefully calculated for strength, and well buttressed.

#### The Bottoms

must always be of cement concrete, and if the foundation is good, 12in. is quite thick enough. Some advocate building the tank entirely separate from the walls of the bath hall to avoid any possible unequal pressure on particular parts, and consequent danger of settlement. But the immense strength necessary for holding the water alone leaves a very ample margin, and, indeed, the additional weights of roof, supports, and floors help the stability. It is, of course, of enormous importance to have the tank absolutely water-tight, and this can be obtained by two or three methods. One of the most usual, I believe, is to have a lining of asphalt behind the brick or tile facing; and in that construction it is very necessary to

#### Use only the Best Asphalt,

and to have it applied in two layers. I do not think asphalt—vertical asphalt—is exactly a good surface for fixing tiles to, and that is no doubt why so many baths—even that fine one at Shoreditch—are lined with glazed bricks. Six-inch glazed tiles are surely preferable for appearance alone, and the introduction of coloured slips and painted tiles give us a field for decorative effect. A safe backing is obtained with two layers of plain flat tiles laid to break joint, and alternated with renderings in cement. This, together with the tile face, makes an absolutely impervious facing 3in. thick; and I may add that I have never found the slightest leakage. In forming the platform round a bath we have to bear in mind that it can never be kept dry, and splashing and the wet feet of bathers, combined with mud from the boots of new comers before undressing, would soon

#### Render the Footways Dirty,

slippery, and dangerous, unless they are frequently washed down with buckets of water and run over with the squeegee. They must, of course, be laid to a good fall away from the bath, not towards it, if only to prevent fouling the bath water. A gutter running down in front of the dressing boxes will lead off the washings. There are more baths than one in London in which this gutter is placed at the back of the dressing boxes, with unpleasant consequences to the unwary bather who may happen to drop any article of clothing on the floor. To avoid this entirely I find it better to raise the dressing box floors above the platform level, the floor sloping outwards to the channel. A good curb—indeed, the best—round the bath is formed with slate 3in. or 4in. thick, and if this overhangs the bath a few inches, a wider footway can be obtained at a very small comparative cost. It also prevents the bath water from splashing over the footways. The gutter may be covered with a brass grating, but that is not absolutely necessary. Footways are usually paved with impervious material, wood and York stone have been advocated, because they are essentially non-slippery—a matter of great importance. Bathers do not always walk sedately along the footways (in fact, from my observations, the sedateness and dignity and statuesqueness affected by bathers are generally washed off in the first plunge), and running along an impervious surface covered with a film of water is dangerous. But it is a pity if we must come down to York paving, with its monotonous colour and cold surface.

#### Tiles Laid Herring-Bone

and in small pieces do very well; and there is another flooring which I will not recommend you till I have tried it, but which I think will be better still. Before we leave the bath itself, mention must be made of the safety rails,

which should run round at least 4in. above the water level. At the deep end the overflow trough serves the same purpose. At the shallow end there should be a spray-rail; that is, a hollow rail, pierced with a line of small holes, and connected with a high-pressure water-main. When the water is turned on occasionally, a regular and even spray is directed on to the surface of the water, which has the effect of cleansing it of scum and floating matter, which are driven down to the overflow trough. I must only briefly mention the desirability of

#### Marking Along the Sides

of the baths, in plain figures, not only the various depths, but distance in yards from the deep end, and other devices to aid in swimming contests; also the necessity of diving-boards, step-ladders, and water-chutes—the latter not being an unmixed blessing. All these matters have their importance, but a short visit to any modern bath will supply all such information. Dressing boxes are always placed along the two long sides of the bath hall, and sometimes one end or both as well. Even so, it is impossible to get enough of them in comparison to the size of the bath. At Marylebone we have some short "transepts," so to speak, with boxes on each side, but I do not like the idea. Dressing boxes out of sight are always liable to be rifled. Want of adequate

#### Dressing-box Accommodation

must be met by some drastic alteration, and I have a glimmering notion or two of some such innovation. To meet this difficulty at the Hornsey-road baths, the dressing-boxes are placed in a separate room adjoining the bath; but the same objection holds even to a greater extent than with respect to transepts. A gallery is only necessary in the first-class or racing bath, and need not be more than 6ft. or 7ft. wide, unless we can afford such a one as that at the Shoreditch Baths. It is advisable to have at least two staircases from the platform level. I do not propose to dilate here upon the various matters necessary to fit the bath hall for use as a concert-room, or for other public entertainments, further than to suggest that if we study

#### The County Council Regulations,

and then satisfy the Council's surveyor, nothing much is left to be done; but it is vital to bear in mind that these regulations have most important bearings on the planning, and should, therefore, be studied from the very first. Dressing boxes for a first-class bath should not, if possible, have less than 12 sq. ft. of area (or, say, 3ft. 6in. square), although it is possible to do with as little as 9ft. They may, and I think should, be constructed with wood-framed sides and doors well painted with enamel paint and varnished. If we take care to keep the partitions well off the floor, there is no reason why they should rot. Of course the use of oak or teak is an improvement, but even then I would have it well varnished or lacquered. When a bath is used for entertainments the boxes are of no use, and the room they occupy is much wanted. To meet this an ingenious arrangement has been lately patented, which, although capable of some improvement in construction, enables us to fold the sides, doors, and seats neatly and very quickly flat against the walls, where they form a fine panelled dado. They can be seen at the Shoreditch Baths. With every swimming bath there should be what is called a soap and spray bath, which may be just one of the dressing boxes fitted up with a foot-bath sunk in the floor, with hot and cold water shower over. Spray and douche arrangements may be added with advantage. Indeed, it is an advantage to elaborate and enlarge this provision.

(To be continued.)

The Middlesbrough Co-operative Society have just erected premises, known as the Victoria Buildings. These buildings cover an area of 6573 square feet. The architect is Councillor Walter G. Roberts, of 61, Albert Road, Middlesbrough.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

March 8th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

### A Cromwell Memorial.

It seems strange that Huntingdon, where Oliver Cromwell was born, has hitherto had no memorial to the greatest of her sons. The omission is to be rectified this year—the tercentenary of the great Protector's birth—by the erection of a statue, for which public subscriptions are to be invited. Various other schemes had been suggested, but at a large and representative town's meeting held last Thursday the statue was unanimously agreed upon.

### An Influential Protest.

ALL the efforts that have been made to restrain the London County Council from carrying out the almost universally condemned design for the new Vauxhall Bridge, which was prepared by their engineer, have hitherto proved unsuccessful. An appeal is now being made to public opinion, and a very influentially signed letter on the subject appeared in last Monday's "Times." The letter points out the inartistic character of the design, which it rightly attributes to the want of collaboration between the architect and the engineer. The sting of the letter is in its tail, where it is hinted that should the Council prove recalcitrant, the ratepayers of London might be induced, through their representatives in Parliament to take from the Council the power of spending the public money on costly structures which reflect no credit on contemporary architecture. The signatories to the letter include the presidents of the Royal Academy, Royal Institute of British Architects, Architectural Association, and Royal Institution of British Artists, as well as a number of other architects and artists of the highest eminence.

### An Ancient Edinburgh Firm.

MEMBERS of the Edinburgh Architectural Association paid a visit last Saturday week to the Milton House Works, Abbeyhill, belonging to Messrs. James Milne and Son, Limited. These works, which cover from 2½ to 3 acres of ground, provide employment for between 700 and 800 workers; they comprise an engineering department, in which malting and papermaking machinery is largely made; water fittings shop, casting shop, gas fittings shop, smiths' shops, and gas apparatus shops. These departments were each visited by parties under the leadership of Messrs. Milne, Lumsden, and Macfie, managing directors. Among particular pieces of work seen in course of construction were a lighthouse for Flannan Head, in the West of Scotland; malting machines, which have been introduced to replace the more common malting floors; a large station gas meter for Perth; an apparatus for the Prince of Monaco, which is designed to take the temperature of the sea at any depth; a large driving wheel, in sections, for a papermill, the delivery of which had been thus belated as a consequence of the engineers' strike two years ago; and many excellent specimens of wrought-iron. There

was also seen an internal combustion engine, which, when perfectly adjusted and introduced into steam vessels, is expected to obviate the necessity of boilers, &c., being carried, and greatly economise the cost of driving ships. It was stated by Mr. Macfie that the Messrs. Milne held authentic records of their existence as a firm in Edinburgh "as candlestickers, &c.," for some 150 years. Their present managing director was the fifth Milne in succession connected with the business, while his forbears were the Milnes, the royal masons and architects of the Stuart period.

### Riddlesworth, Norfolk.

THE fine old mansion known as Riddlesworth Hall, dating from 1780, which on February 10th was the scene of a most destructive fire (little being left beyond the bare walls), will, we understand, shortly be rebuilt. The hall is the seat of Mr. W. N. L. Champion, and the rebuilding will be carried out from designs of Mr. Herbert Green, of Norwich. The building is covered by insurance to the extent of £20,000.

### A Village Memorial.

LLANSANNAN is not exactly a household word with most of us. It is the name of a picturesquely situated Welsh village which is just now setting an example of artistic enterprise which many more pretentious places might well emulate. Llansannan has determined to commemorate by a bronze monument five eminent Welshmen who were natives of the parish, viz.: Tudur Aled, a famous bard, who flourished in the sixteenth century; William Salisbury, the translator of the Welsh Bible; Iorwerth Glan Aled, another celebrated poet; and the Revs. Henry and William Rees, famous Welsh divines and preachers. The commission for the work has been entrusted to Mr. Goscombe John, A.R.A., who is himself a Welshman, and it is expected that the monument will be unveiled on Whit Monday.

### Aldersgate's Parish Church.

THE Vestry of St. Botolph, Aldersgate, has accepted the generous offer of Mr. G. F. Watts, R.A., to erect in connection with the churchyard a covered way, in which will be placed tablets commemorating acts of heroism in everyday life. The suggestion was made by Mr. Watts, as long ago as 1887, that something of this sort should be done as a suitable way of commemorating the Queen's Jubilee. But, though many foolish suggestions were adopted at the time, this eminently sensible one was overlooked. The extension of the churchyard in Aldersgate Street has provided the opportunity for the revival of the idea, and Mr. Watts has undertaken to defray the necessary expenses. Another valuable gift has just been made to St. Botolph's Church, viz., three pictures by Mr. Sigismund Goetze, which it is proposed to affix into the panels over the Communion table. The largest of the pictures, which are presented by the artist, represents a figure of the Dead Christ, with angels at the head and feet, and was exhibited last year in the Royal Academy under the title of "Eloquent Silence." The other paintings represent the motto "Watch and Pray," the one being a mailed figure with sword unsheathed, and the other a female form in the attitude of prayer.

### Disappearing London.

ONE by one London seems to be losing all its old houses of literary and antiquarian interest. Within the past few weeks we have heard of the impending destruction of two houses that were at one time occupied by Dr. Johnson. The one is the house in Johnson Court, at the back of Anderton's Hotel in Fleet Street; the other is Priory Lodge at Hampstead. The latter was the doctor's country residence, for Hampstead then, of course, was a locality "far from the madding crowd." It is a picturesque old house, though it has been altered considerably since Johnson's day. Another house of some antiquarian interest that is in process of demolition is the Stag Tavern in Castle Lane, Westminster.

The tavern is interesting for its association with a very different kind of person, to wit, Dick Turpin, who was wont to favour it with his custom. It had a finely-carved canopy over the doorway. Yet another building of historic interest that will shortly be pulled down is the Independent Chapel in Fetter Lane. The chapel was established in 1660, and the existing building dates from 1732.

### London Improvements.

THE London County Council Bill giving powers for the construction of a new street between Holborn and the Strand was read a second time in the House of Commons last Tuesday week. There was no opposition to the bill, though Sir Henry Fowler protested against what he regarded as the County Council's undue delay in effecting the removal of the Holywell Street "island" in the Strand. On behalf of the Council, it was pointed out that the widening of the Strand by the removal of the Holywell Street island would add considerably to the value of the circumjacent properties required for the new street, unless powers were sought in the present session, so that they might be obtained before the removal of the Holywell Street island. It is, therefore, with a view to saving the ratepayers' money that the Strand improvement is being delayed for a few months. In the course of the discussion Mr. Burns foreshadowed still further improvements to be accomplished in the future. What the London County Council wanted was a big street from Euston Station, through Holborn, to the Strand, the removal of the Strand island, and, probably, ten years hence, another bridge east of Somerset House.

### A find at Hampton Court.

An interesting discovery has just been made at Hampton Court Palace. While a number of pictures were being removed from the walls, occasion was also taken to strip off the canvas and paper covering the former ornamentation of the walls. It was then seen that three sides of the room, which measures 41ft. by 34ft., were covered with rich paintings, all in an excellent state of preservation but for the disfigurement of holes caused by the nails which had been driven into the walls on which to hang the pictures. The ceiling of the room is painted by the celebrated artist Verro, Queen Anne being represented as Justice with Neptune and Britannia holding a crown over her head, and various allegorical figures being grouped around. The paintings on the walls are by the same artist. Orders have been given for the holes in the walls to be filled in carefully, and when this has been done the services of one or more skilled artists will be requisitioned to repair the damage, and, as far as possible, to restore the paintings to their original condition. It is stated that the paintings have been covered in this way for more than 100 years.

### Electric Tramways in New York.

Now that so many municipalities throughout the kingdom are considering the question of the best system of street traction to adopt, it is interesting to note the experience of some of the American cities where electric traction in one form or other has long been established. We find from the New York papers just to hand that in the blizzard experienced a few weeks ago the electric system by conduit, which is superseding the cable cars in that city, completely broke down. The reason for the failure is said to be the impossibility of establishing a steady circuit between the source of powers and the mechanism on the cars when ice accumulates on the conductor rail in the conduit or on the rail in the street. The accumulated ice completes the circuit between the negative and positive poles in the conduit itself, the electric current cannot pass through the mechanism of the car, and the car stops. The New York "Mail and Express" speaks of compressed air as the "coming power" that is to supersede both cable and electric cars in New York.

## Professional Practice.

**Aberdeen.**—It is proposed by the Aberdeen School Board to convert the Central School, Aberdeen, into a higher-grade (science) school, providing, in addition to other things, instruction of a commercial or scientific kind for pupils preparing to begin a trade or enter some line of business. In that view, plans have been prepared by the Board's architect and master of works, Mr. J. A. Ogg Allen. The plans show the building with a frontage to School hill of nearly 120ft., going back into the site towards the present Central School buildings nearly an equal distance. The building will be higher than any of the buildings in the immediate vicinity, being 70ft. in height to the apex of the roof, beyond which there will be a small central turret that accentuates the impression of height, and lives at the same time a pleasing finish to the design. The building is to be four stories high, and is to be built of light grey granite. In arranging the interior the architect has taken the fullest advantage of the space for the provision of class-rooms, of which about eighty of one kind or another will be provided. The total cost of the new building is estimated at £17,000.—The Plans Committee of the Town Council have sanctioned the following plans:—Additions in connection with premises on the south side of Queen Street, for Mr. William Coutts, aerated water manufacturer, per Mr. William Ruxton, advocate; dwelling-house on the west side of Fraser Road, for Messrs. George Fordyce and Co., builders, per Messrs. Brown and Watt, architects; stable and coach-house at the rear of dwelling-house on the west side of Forest Avenue, for Mr. J. Conno, jun., furniture dealer, per Mr. Alexander Matheson, builder; dwelling-house on the east side of King Street, north of Ladymill, per Mr. J. B. Cairns, hide and tallow merchant, per Mr. John Rust, architect; stable on the east side of Stell Road, for the Northern Cooperative Company Limited, per Mr. Alexander Taylor, architect; three dwelling-houses on the east side of King Street, for Mr. Andrew Wallace, butcher, per Messrs. Brown and Watt, architects (amended plan). The Committee had also before them plans of two dwelling-houses on the north side of Devonshire Road, for Mr. W. S. Lunan, bank teller, and the executive of the Independent Order of Rechabites, per Mr. George F. Milne, architect. The Committee approved of this plan on condition that the height of the water mains is to be fixed by the Burgh Surveyor.

**Bridlington.**—The foundation stone of the Yorkshire Foresters' Orphanage and Conalescent Home, was laid on Feb. 23rd, by Bro. R. S. Kirk, of Leeds, and several memorial stones were laid by representatives of the various courts and districts of Yorkshire. The building is being erected by Messrs. F. Blackburn and Son, of Hull, and the architect is Mr. Robt. J. Beale, A.R.I.B.A., of 9, Victoria Street, Westminster, whose design was selected in competition.

**Dundee.**—The following plans of proposed new buildings, &c., in Dundee, lodged by William Mackison, F.R.I.B.A., Burgh Engineer, have been approved by the Works Committee of the Town Council:—Ash Lane and Loches Road, dwelling-house and shed, per Joseph Clark; High Street, alteration on property for the trustees of Patrick Watson; North George Street and Union Street, weaving shed for J. and A. D. Grimond Limited; Annadice Street, alteration on property for William Adamson; Westfield Avenue, alteration on dwelling-house for the Dundee and District Tramway Company Limited; Kemick Street and M'Gill Street, alteration on dwelling-houses for A. E. Tulloch.

**Horncastle.**—An octagonal Gothic structure 14ft. in height, and 7ft. in diameter standing on a platform of steps, has been lately un-

veiled in the town of Horncastle. It has been erected by public subscription in memory of the Right Hon. Edward Stanhope, M.P., late Secretary of State for the War Department, and contains a bronze medallion likeness; it consists of three stages, the lower one being solid of Monks Park stone with diaper panels between polished red granite shafts, and crocketed pediments above, the middle stage is an open arcading consisting of polished red granite columns with carved Monks Park caps and a double set of trefoiled work above, the third stage consisting of a lantern covered with lead, supported by gun-metal shafts and finished by an ornamental finial of the same material. The design was selected in open competition out of about 70 responses and is the work of Mr. E. H. Lingen Barker, of London and Hereford, the Contractors being Messrs. Walter and Hensman, of Horncastle, and the Sculptor Mr. C. J. W. Ladds of West Veal.

**Hull.**—The memorial stone of the new premises which are being erected for the Hull Constitutional Club was laid last Wednesday. The site of the new club is a central one, in Carr Lane, one of the outlets westward from the centre of the city. The new building is to cost nearly £5500, and the furniture it is estimated will cost £2000. Mr. B. S. Jacobs, of Hull, is the architect, and he has designed the structure in free Renaissance style, the front elevation being faced with Ruabon bricks, and buff terra cotta of Burmantofts manufacture for dressing cornices and strings. The accommodation comprises, on the ground floor, a large hall 43ft. by 19ft., and separated by movable partitions from a reading-room. On the other side are the steward's rooms, lavatories, &c., and the main staircase. At a slightly higher level and further back is the billiard-room for three tables, and on this floor are the female servants' quarters. On the first floor to the front is the dining-room, 43ft. by 20ft.; a cardroom, serving-rooms, lavatories, &c. On the second floor are the boardroom, smaller dining-room, secretary's room, and one or two bedrooms, bathroom, &c. On the third floor there are bedrooms for members, steward's quarters, and men servants' dormitories, with bathrooms. The basement contains kitchens, sculleries, wine, beer, and coal cellars, waiters' and female servants' sitting-rooms, steward's workrooms, heating chambers, and the usual outbuildings, and a large bicycle room. The main hall and staircase are to be furnished in oak. Messrs. E. Good and Sons Limited, are the contractors.

**Hyde.**—The New Technical School and Free Library has just been opened. The building is calculated to provide accommodation for about 900 students, and has cost nearly £13,000. The erection of the works has been in the hands of Messrs. S. Robinson and Son, contractor, of Hyde, from the designs and under the supervision of Messrs. Woodhouse and Willoughby, F.S.R.I.B.A., architects, of Manchester and Stockport, assisted by the clerk of works, Mr. Samuel Mellor. The design was selected in a limited competition of architects, who have given this kind of work special study, and on the advice of the assessor chosen by the committee, viz., Mr. Thomas Worthington, F.R.I.B.A., of Manchester. The style of the building is a free treatment of the English Renaissance. The building is divided into two sections, a Public Free Library in the one, and a Science, Art, and Technical School in the other. The principal elevations are faced with machine-made red Ruabon bricks, having all designs and enriched work carried out in Doulton's Rowley Regis "Biscuit Coloured" terra cotta. The whole of the roofs are covered with Westmoreland "Sea Green" slates, finishing at the apex with a red Ruabon ridge tile. The building is provided throughout with electric light, installed by Messrs. Laidlaw, Scholes, and Co., Temple Street, Manchester. The engine for electric light has been supplied by Messrs. Crossley Bros., Manchester; the dynamo by Messrs. Stanley, Davies, and Pollard, of Hyde. The painting and decorating

has been carried out by Mr. William Artingstoll, of Hyde; the library fittings supplied by Messrs. S. and J. Turner, of Hyde; the bookcases by Mr. W. W. Batty, Hyde; and the heating apparatus by Messrs. Hartley and Aspinall Limited, Hyde. The fitting-up of the technical school has been in the hands of the Bennett Furnishing Company, of Glasgow, London, and Canada.

**Romford.**—The new casual wards at Romford Workhouse were opened last Tuesday week. Mr. E. G. Boden is the architect. The new wards comprise a fine range of buildings about 40ft. by 70ft. They consist of two floors and basement, on which are day and sleeping cells, lavatories, and bathroom. The cells communicate with the attendant's room by means of an electric bell. On the first floor there is also an associated ward, in which movable hammocks are fitted, to be used in emergency cases. This is also to be used as a day or working room for light labour, or, if necessary, as a dining-room. The buildings are warmed with hot water. The work has been carried out by Messrs. Downing and Davis, of Romford, at a cost of about £3000.

**Southsea.**—Operations in connection with the erection of fine new premises for the National Provincial Bank of England have been commenced on the site at the corner of Palmerston Road and Clarendon Road, where the old bank and some houses stood. The frontage to Palmerston Road will be 40ft., and to Clarendon Road 70ft. The elevation will be carried up with granite to the window sills of the ground floor, above which, up to the first floor windows, will be of Portland stone, with carved caps and double block columns, while the upper part will be in Holwill's impervious ware, brick facings, with Portland stone dressings, the whole to be surmounted with a heavy and rich cornice. The offices will include a large banking hall, with entrance at the corner of Palmerston and Clarendon Roads, manager's room, waiting room, and three strong rooms. The manager's private residence will be at the further end of the building in Clarendon Road, and here will be provided every accommodation, with kitchen at the top of the commodious house. The air space at the back of the building will permit of ample light. The foundations are now being prepared, and the buildings will be proceeded with as rapidly as possible by Mr. Light, the contractor, in accordance with plans prepared by the architect, Mr. W. W. Gwyther, F.R.I.B.A., 26, Bedford Row, London, W.C. The clerk of works is Mr. H. F. Sheppard.

**Whitwell.**—At Worksop County Court Augustus George Taylor, architect and surveyor, of New Brighton, formerly of Whitwell, Derbyshire, sued Mr. S. Clarke, of Worksop, and others, trustees of the Free Methodist chapel, Whitwell, for £32 10s., for preparing a plan of a proposed new chapel at Whitwell, and drawing up a bill of quantities for the same. Plaintiff alleged that he was ordered by the trustees to prepare the plan produced. He estimated the cost of the building at £1300, and for preparing the plan he had charged one per cent. He was also ordered by the trustees to prepare a bill of quantities required, and for this work he had charged one and a half per cent. on the estimated cost of the building, or £19 10s., making in all £32 10s. He considered the charge perfectly reasonable. For the defence it was alleged that plaintiff had informed the trustees that he would prepare an estimate of the cost of the proposed building for a very small sum, that the charge made was most extortionate, that the plan was practically useless and unworkable, being entirely without specifications, whilst the bill of quantities prepared was only a rough sketch of what would be required.—His Honour considered it a very fortunate thing that the trustees had not attempted to build with plaintiff's plan, and he considered that the defendants had behaved handsomely in the matter in paying £20 into court. There would be judgment for defendants with costs.

## Under Discussion.

### THE ARCHITECTURAL ASSOCIATION.

A largely attended meeting of this association took place at 9, Conduit Street, W., last Friday night, at 7.30 p.m., with the President, Mr. G. H. Fellowes Prynne, F.R.I.B.A., in the chair. The minutes of the previous meeting were read and confirmed, and the following gentlemen were elected members of the association:—N. B. Fairweather, C. F. Houston, and G. Gilbert Scott. It was then announced that a meeting will be held at 56, Great Marlborough Street, W., next Friday evening, at 7.30 p.m., of members desirous of re-establishing the A.A. Cycling Club, and to draw up rules, appoint officers, arrange runs, &c. A vote of thanks was awarded to Mr. J. F. Bentley, for permitting members of the Association to visit the Roman Catholic Cathedral at Westminster. The next spring visit of the Association was announced to take place on Saturday, March 11th, when, at 2.30 p.m., Colonel Edis will conduct members over the Great Central Hotel, Marylebone Road. At 3.30 p.m., Mr. E. Wragge, resident engineer, will conduct a visit to the Great Central Railway Station adjoining. Mr. A. Saxon Snell, F.R.I.B.A., then read his paper on "Public Baths," which was followed by an interesting discussion, and he was awarded a hearty vote of thanks. The first part of this paper will be found on page 74 of this issue. The president announced that the next meeting will take place on March 17th, when Mr. Reginald T. Blomfield will read a paper on "Reflections on the Early Renaissance."

### REMBRANDT AND BURNE-JONES.

Mr. Croal Thomson, editor of the "Art Journal," recently delivered a lecture to the Highgate Literary Association, in the Presbyterian Hall, Highgate, on "Rembrandt and Burne-Jones—a contrast and a comparison." The lecture was illustrated by a large series of drawings, etchings, and reproductions of these artists' work. Mr. Croal Thomson said he had sought an opportunity to speak on Rembrandt and Burne-Jones, because in his opinion Rembrandt was the greatest painter among the Old Masters, in what may be termed the non-classical school, while Burne-Jones, although he can be said to be in every way supreme, was one of the greatest of the modern exponents of classical themes. Rembrandt was dignified, sincere, masterly, and intensely human. His understanding of his fellow-creatures was beyond adequate interpretation in words; his masterfulness in execution was greater than that of any other artist, not excepting Frans, Hals, and Velasquez. His dignity was equal to that of Michael Angelo, and his sincerity was unsurpassed by the single-number painters who flourished before the time of Raphael. It might be admitted that the subjects of Rembrandt's pictures appealed more to the eye than to the mind. The subject with him was little, the manner of work, the quality of colour, and the grandeur and simplicity of style being everything. On the other hand, Burne-Jones in his subjects conquered the intellect by learning, by classic story, and familiar legend. With him the intention counted for a great deal, and in some cases practically everything. In taking these two artists for a comparison and contrast, the comparison lay most in their devotion to work and in their achievements, while the contrast was that Rembrandt, certainly by far the greater master of the two, was a Goth in almost all his productions, and Burne-Jones, to the finger tips, was imbued with classic feeling. After briefly sketching the careers of the artists, the lecturer spoke of Burne-Jones's connection with the Royal Academy, which, in a fit of expansiveness, speedily regretted, elected him an Associate in 1885. This body, so genial in its single items, but so solemnly inert in the bulk, refused to advance Burne-Jones to full honours, so after, as he expressed it, waiting on the doorstep for fully seven years, he withdrew

from the Academy and amiably shook its dust from off his feet. In 1893 Mr. Gladstone, ever with a soft side to Art and artists, offered him a baronetcy, and thus the artist was as greatly distinguished in the eyes of the world as any of the Academy. The great objection to Burne-Jones's works had been that the artist's ideal of women was the effeminate rather than the physically strong. Many people, and it was accentuated by the somewhat foolish admiration for physical strength now prevalent, considered that Burne-Jones had lost much in his tendency to be feminine. They resented the idea that a woman may be refined, lovable, and intelligent without being plainly robust. The ultimate reputation of Burne-Jones could not be definitely stated. But the lecturer had no hesitation in giving it as his opinion that the longer his work was known the better it would be liked, until future generations would regard him with the veneration we willingly accord to the Italian masters of the fifteenth and sixteenth centuries. Concluding with a consideration of the Rembrandts now at the Academy, Mr. Croal Thomson said the Amsterdam collection last autumn had been a challenge to English collectors, and nobly had those who were owners of Rembrandts responded to it. For once the Academy more than justified its name of Royal; the nobility and majesty of those great Rembrandts made it worthy of something even stronger, and "Imperial" Academy would not for the time be too highly-flavoured a term. Rembrandt was a veritable giant amongst painters. Concentrated in his career was an artistic experience equal to that of a score of other artists, and the intellectual and æsthetic delight in following such a master's development could not be over-estimated. The pleasures of the mind and eye exercised in their consideration would in time become the property of everyone who had the intellect and education to wish to enter into the best inheritance of the ages.

### LEGAL POINTS AFFECTING ARCHITECTS.

On the evening of the 15th ult., Mr. J. Connell, lectured before the Edinburgh Architectural Society, on "Legal Points Affecting Architects." Mr. A. Lorne Campbell, the president, occupied the chair. After alluding to the Dean of Guild Court procedure, and the rights of neighbours, the delicate subject of remuneration and fees was discussed. Mr. Connell's advice was always to have a stamped contract with the clients especially if dealing with a company. On the ownership of plans question Mr. Connell pronounced in favour of the client. The position of the architect as agent for the client was then gone into, and the liability of the architect for breaches of contract and accident commented on. The completion of works and penalty clauses of contracts were then discussed, the lecturer explaining that the penalty clause can only be acted on so far as expense is incurred by the breach of contract. Burdens on land were next gone into, and the remainder of the lecture was devoted to a discussion of the somewhat intricate laws, affecting restorations, alterations, and additions. Mr. Connell explained that the law was interpreted to give as much freedom as possible. Mr. A. R. Scott proposed the vote of thanks which was heartily accorded.

### GLASGOW ARCHITECTURAL ASSOCIATION.

At the last fortnightly meeting, held in the Rooms, 187, Pitt Street, Mr. Wm. J. Anderson, A.R.I.B.A., delivered a lecture, entitled, "Impressions of a Mediterranean Trip," describing—mostly in a light and humorous manner—a cruise by way of Algiers and Malta to Athens, and a return journey by Corfu, Naples, Nice, and the Loire district of France for purposes of architectural study. Among impressions of the tour which he indicated were, the feeling that good design and largeness of conception had been evinced in the planning and extension of most Continental cities, while they were almost wholly absent from ours, and that there existed an aspiration for something beyond the fulfilment of mere material necessities in their

public buildings. This was to be attributed, especially in the case of France, which in such matters led the Continent, to the steady influence of sound traditions of architectural education, which in permeating society with the understanding and the love of art, fostered the desire as well as provided the talent for its realisation. More particularly have we to learn the lesson in so-called engineering works such as bridges, railway stations, markets, &c., which in France are often among the most successful works of its brilliant school of architects. No question of art was at all comparable to the need for the improvement of our cities in these respects, and for skilled control of the development of their plan. In an Anglo-Saxon community it would almost seem as if the provision for animal necessities was sufficient, and that to aspire in our handiwork after anything nobler than the aims of the bird and beaver was to be hopelessly Utopian and unpractical. Concluding, the lecturer urged the claims of a more extended historical study of architecture, not for practical reasons only but as examples of the higher manifestations of nature, reaching us through the human spirit whose path in relation to every essential matter of progress was marked by its monuments. Mr. W. H. McNab moved a vote of thanks to the author for his very able paper, which was heartily accorded.

### POLLUTION OF RIVERS.

A conference was held at the Sanitary Institute, Margaret Street, W., on the 14th Feb., to consider the question of river pollution. The chair was taken by Sir Francis Sharp Powell, M.P., who said the condition of the rivers had been a discredit and almost a scandal to the country at large, resulting in great injury to the public health. Dr. C. Childs moved a resolution calling for free access to land and premises by local authorities for the purpose of water inspection, and advising regular examinations. Dr. Sargeant seconded the resolution. Dr. Willis Bund (Chairman of the Worcester County Council), said that the people who polluted the River Severn were the local authorities. If they expected those authorities to do the work well they would be disappointed. He moved the substitution of "County Councils" for "Sanitary Authorities." Lieut.-Colonel Jones seconded the amendment, and after some discussion, in which Sir John Dorington, M.P., Sir John Hibbert, M.P., and others took part, the motion was agreed to in a form which combined the County Councils with the Sanitary Authorities. Other resolutions were in favour of regular inspection and examination of water applied by the water authorities; the regarding of wilful or negligent pollution as a penal offence; and supporting the Rivers Pollution Prevention Bill now before the House of Commons.

### MUNICIPAL BUILDINGS.

At the conclusion of the paper on "Municipal Buildings," read before the Bristol Society of Architects, by Mr. Arthur Lee, an abstract of which appears on another page, the lecturer referred to the municipal buildings in Glasgow. "Scotchmen," he said, "are proverbially of an economic turn of mind, but they are shrewd as well as cautious, and believe that as was in the past so it is in the present, that an enlightened, intelligent, and prosperous community does well from a purely business point of view to mark its enlightenment, intelligence, and prosperity, by the solid and beautiful character of its public buildings. The municipal buildings recently erected will be one of the most lasting monuments the citizens of Glasgow will leave to tell to future generations the marvellously rapid growth of their city. Thrice during the memory of living men they have erected Municipal Buildings, each adequate for its time, but when it was found in consequence of the rapid growth of the population, the extended boundaries, and the rapid increase in the commerce and material resources of the city, more room was required, the Town Council decided, not of narrow policy of adding to or patching

ir last building, but to acquire a new site the principal square in the city, and there erect a building not only adequate for the present time, but capable of being the seat of the municipal government of the still later Glasgow of the future. May Bristol be a lesson from the careful, wisely-economic city, may her rulers pluck up courage, and make a makeshift policy of patchwork and half-measures, and follow in the footsteps of the surprising men of Glasgow."—The proceedings terminated with a hearty vote of thanks to Mr. Lee, on the motion of the President, seconded by the Vice-President, and supported by Mr. Frank Wills, the latter of whom strongly endorsed the remarks of the lecturer with reference to municipal buildings.

### MANCHESTER GAS ENGINEERS.

The annual meeting of the Manchester District Institution of Gas Engineers was held the 21st February. In the forenoon a visit was paid to the Gaythorn station of the Manchester Corporation Gasworks. Particular attention was devoted to the machinery for conveyance of coke, &c., used in connection with an installation of inclined retorts. From the gasworks the members drove to the Grand Hotel, where luncheon was served, and a meeting was afterwards held in the Masonic room of the transaction of business. The Hon. Secretary (Mr. S. S. Mellor, Northwich) submitted the Committee's annual report, in which it was stated that four successful meetings had been held during the year, and that membership now reached 134. Mr. G. E. Benson was elected senior vice president, Mr. Charles Wood, of the Bradford Corporation Gasworks, junior vice president; Mr. Thomas Newbigging was re-elected treasurer, Mr. Mellor secretary. Thanks were accorded the retiring president, Mr. W. S. Haddock, Warrington, and the other officers for their services during the past year. Mr. Haddock then introduced his successor in the presidential chair, Mr. R. G. Shadbolt, of Grantham, who delivered his inaugural address, in which he discussed the question of gas enrichment and other points connected with the technicalities of gas manufacture. He said that the gas industry was full of life and energy. The Board of Trade returns showed that during the past ten years—the time they ought, according to some prognosticators, to have expired in the process of dissolution—the gas industry had increased their gas sales to the extent of 50 per cent., while the increased profit from gas sales necessary to pay dividend and interest on the extra capital employed during the same period stood at the ridiculously disproportionate figure of 7 per cent. Lancashire and Yorkshire contributed 25 per cent. of the total gas made by the authorised gas undertakings of the country. A discussion afterwards took place on a paper read at a former meeting by Mr. J. H. Brearley, of Longwood Works, on "The Balance Sheet."

### INFLUENCE OF THE ATMOSPHERE.

At a meeting of the architectural section of the Philosophical Society of Glasgow, held on Tuesday 27th, a paper was read by Mr. Oscar Pearson, glass stainer (Roy. Scot. Soc. Arts), the subject of "Atmospheric Influence on Architecture and Decorations." The paper was illustrated by chemical demonstrations and a large number of lantern slides. In the course of his remarks the lecturer pointed out the very offensive and noxious condition of the atmosphere of Glasgow was the result of the free escape of factory smoke and the consequent oxidation of the sulphur in the air into sulphuric acid. The immediate effect of the dissemination of this corrosive virulent compound was observed in the decay of the stone of public buildings and destruction of vegetation, while the free escape of carbon carried over in soot of factory smoke settled on stonework, turned the natural brightness of the material into a dingy and sombre grey, and destroyed the precision, fineness, and quality of the Architecture. Referring to the

action of the atmosphere on decoration, the lecturer pointed out that sulphuric acid and hydric sulphide were the principal factors in the change of colour that took place in certain decorations. It was also suggested that by a due attention to an efficient medium and method of painting the most fugitive colours almost could be rendered permanent. In Mr. Paterson's opinion Glasgow ranked next to London almost in the impurity of its atmosphere, and he held that, however high a position the city might have acquired as an Art centre, there was probably no other town in the kingdom where public buildings and decorations had so uncertain a condition of stability.

### DISCOVERIES IN RHODESIA.

Dr. H. Schlichter read a paper before the Royal Geographical Society on "Travels and Researches in Rhodesia," on Feb. 27th. Dr. Schlichter stated that his investigations led him to the centre of Matabeleland and Mashonaland, by way of Bulawayo and Salisbury to Inyanganga, a place full of unmistakable indications of an ancient civilisation. At Zimbabwe, which he also visited, were to be found a number of direct analogies to the early Israelitish solar and astral worship, of the period before that race had arrived at monotheism. They had in Zimbabwe an enormous gnomon comprising a total angle of 120 deg., and from the obliquity of the ecliptic, taking all the details into consideration, he believed they must attribute the erection of the Zimbabwe buildings to a period about 1100 B.C. The Momo ruins, between Bulawayo and Gwelo, were somewhat smaller than the Zimbabwe temple, but in construction and ornamentation superior to it. They consisted of a number of buildings of which the central corresponded to the circular temple in Zimbabwe, while the others were additional enclosures and fortifications. The Central building was, from an architectural and astronomical point of view, the most interesting ruin south of the equator. In the Momo ruins were to be found indications of (1) solar worship (2) fortifications, and (3) gold production. The Rhodesia ruins were the first discovered traces of old civilisation in the southern hemisphere.

### COMING EVENTS.

#### Wednesday, March 8.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. James Campbell Irons on "The Architectural Antiquities of Leith." 8 p.m.

MANCHESTER MUNICIPAL SCHOOL OF ART LECTURES.—Mr. Hugh Stannus, F.R.I.B.A., on "Storiation in Manchester." 8 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Annual Meeting at 7.30 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and Demonstration at the L.C.C. Municipal Lodging House, Parkes-street, Drury Lane, at 3 p.m. Conducted by Mr. Frank Ruddle, of Estates and Valuation Department, L.C.C.

SOCIETY OF ARTS.—Mr. J. H. Collins, F.G.S., on "Cornish Mines and Miners." 8 p.m.

LIVERPOOL ENGINEERING SOCIETY.—Paper by Mr. Bryson Cunningham. 8 p.m.

ARCHITECTS' BENEVOLENT SOCIETY.—Annual general meeting of the subscribers and donors will be held in the rooms of the Royal Institute of British Architects. 5 p.m.

SANITARY INSTITUTE.—A discussion to be opened on "The Establishment of Public Abattoirs in the Metropolis in relation to the Prevention of Tuberculosis," by Dr. William Arthur Bond, M.A. 8 p.m.

#### Thursday, March 9.

INSTITUTION OF ELECTRICAL ENGINEERS.—Meeting at 8 p.m.

SOCIETY OF ARTS.—Meeting of Indian Section.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Dr. J. F. J. Sykes, D.Sc., M.D., on "Objects and Methods of Inspection, Nuisances, &c." 8 p.m.

SOCIETY OF ANTIQUARIES.—8.30 p.m.

ROYAL INSTITUTION.—Mr. William Poel on "English Play-houses in the Fifteenth, Sixteenth, and Seventeenth Centuries." I. 8 p.m.

#### Friday, March 10.

INSTITUTION OF CIVIL ENGINEERS.—(Student's Meeting.)—Mr. H. Lapworth on "The Construction of the Elan Aqueduct, Birmingham Waterworks." 8 p.m.

#### Saturday, March 11.

ARCHITECTURAL ASSOCIATION.—Spring visit to the Great Central Railway, Marylebone-road, at 2.30, conducted by Colonel Edis; and the Great Central Railway Station adjoining, at 3.30, conducted by Mr. E. Wragge, resident engineer.

INSTITUTION OF JUNIOR ENGINEERS.—Conversations at Westminster Palace Hotel. Reception at 7 p.m.

ROYAL INSTITUTION.—The Right Hon. Lord Rayleigh on "The Mechanical Properties of Bodies." V. 3 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Colinton House, Colinton Castle, and Redhall. Dr. R. Rowand Anderson, Hon. R.S.A. leader.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and demonstration at Friar Barrow Sewage Works at 3 p.m. Conducted by Mr. E. J. Reynolds, A.M.I.C.E.

#### Monday, March 13.

BRISTOL SOCIETY OF ARCHITECTS.—Mr. George H. Oatley on "Bills of Extras."

SOCIETY OF ARTS.—(Cantor Lectures.)—Mr. Archibald Sharp, A.M.I.C.E., on "Cycle Construction and Design." III. 8 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Dr. Joseph Priestley, B.A., M.D., on "Ventilation, Warming, and Lighting." 8 p.m.

#### Tuesday, March 14.

PERTH ARCHITECTURAL ASSOCIATION.—Mr. William M. Page on "Art." 8 p.m.

SOCIETY OF ARTS.—Meeting of Applied Art Section at 8 p.m.

#### Wednesday, March 15.

MANCHESTER MUNICIPAL SCHOOL OF ART LECTURES.—Sir Thomas Wardle, on "Calico Printing as an Art." 7.30 p.m.

SOCIETY OF ARTS.—Ordinary Meeting at 8 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and Demonstration of Disinfecting and Filtering Appliances at the Lambeth Disinfecting Station, Wandsworth-road, Loughborough-junction, at 3 p.m. Conducted by Mr. Wolf Defries, B.A., M.I.C.E.

## CONTRACTS OPEN.

### THE ROYAL NATIONAL EISTEDDFOD OF WALES, 1899.

#### TO BUILDERS AND CONTRACTORS.

The Executive Committee of the above Eisteddfod invite TENDERS for the ERECTION of a TEMPORARY PAVILION in The Cathays Park, Cardiff. The plans may be seen, and copies of the quantities obtained from GEO. THOMAS, F.S.I., Queen's Chambers, Cardiff, after MARCH 6th.

A premium of One Guinea will be charged for the quantities, to be returned on receipt of a bona-fide Tender.

Tenders to reach the undersigned not later than ELEVEN a.m. on MONDAY, MARCH 13th, 1899. The Committee do not bind themselves to accept the lowest or any Tender.

D. W. EVANS, } Hon.  
EVAN OWEN, } Secs.

St. Mary's Chambers, Cardiff.

### TO BUILDERS and CONTRACTORS.

The London County Council is prepared to receive TENDERS for the CONSTRUCTION of a BRICK CULVERT and FLAP-CHAMBER, the REMOVAL of the existing LOCK GATES, and the FIXING of TIDAL FLAPS, together with certain ALTERATIONS and REPAIRS at the King's Scholars' Pond Sewer Pumping Station, Grosvenor-road (near Vauxhall Bridge), Pimlico.

Persons desiring to submit Tenders may inspect the drawings and obtain the specifications, bills of quantities, form of Tender, and other particulars at the Engineer's Department, County Hall, Spring Gardens, S.W., upon payment of the sum of One Pound.

This amount will, after the Council or its Committee has come to a decision upon the Tenders received, but not before, be returned to the tenderer, provided he shall have sent in a bona-fide Tender and not have withdrawn the same.

Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with.

The contractors will be bound by the contract to pay to all workmen (except a reasonable number of legally-bound apprentices) employed by them wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

Tenders are to be delivered at the County Hall in sealed covers addressed to the Clerk of the London County Council, and marked "Tender for Tidal Flaps and Culverts, King's Scholars' Pond Sewer Pumping Station."

No Tender will be received after TEN a.m. on TUESDAY, MARCH 14th, 1899. Any Tender which does not comply with the printed instructions for Tender may be rejected.

The Council does not bind itself to accept the lowest or any Tender, and it will not accept the Tender of any person or firm who shall on any previous occasion have withdrawn a Tender after the same has been opened,

unless the reasons for the withdrawal were satisfactory to the Council.

C. J. STEWART,  
Spring Gardens, S.W. Clerk of the Council,  
March 1st, 1899.

### TO BUILDERS.

The Guardians of the Poor of the Parish of Giles', Camberwell will, at their meeting, on WEDNESDAY MARCH 15th next, be ready to receive TENDERS for ALTERATIONS to Workhouse Buildings, at Constance-road, East Dulwich, and ADDITIONS thereto.

The drawings, specifications, and draft contract be seen at the offices of the Architects, Messrs. HENRY JARVIS and SONS, 29, Trinity-square, Borough, S.E., on and after the 25th inst., where bills of quantities (prepared by Messrs. FRANK and ANDREWS) can also be obtained on Payment of £5, which will be returned to each person sending in a bona-fide Tender.

The contractor will be required to enter into a bond with two approved sureties, in the sum of £2000.

Tenders, which will only be received on the printed forms, addressed to the Board of Guardians, sealed and endorsed "Tenders for Alterations and Additions Workhouse Buildings, Constance-road," accompanied by the priced bills of quantities, must be delivered before TWELVE noon, on WEDNESDAY, MARCH 15th, 1899, and all persons Tendering, or their authorised representative, to be in attendance at SIX o'clock on the same day.

The contractor whose Tender is accepted will be required to pay his workmen such rates of wages and observe such hours of labour as are recognised by the workmen's Trade Unions, and prior to signing the contract make a declaration to that effect.

The Guardians do bind themselves to accept the lowest or any Tender,

By order,

CHARLES S. STEVENS,  
Guardians' Offices, Clerk to the Guardians,  
No. 29, Peckham-road, S.E.  
February, 24th, 1899.

## INSANITARY AREAS AND HOUSING SCHEMES.

BY PETER ADDIE, F.S.I.

(Continued from page xxvii.)

THERE is still some uncleared land unlet in and near Corporation Street, which is at present producing no rental, but it is estimated that this will bring in sooner or later another £1000 per annum. On the other hand, interest on loans, sinking fund charges, and management expenses entail a total outgoing of about £69,000 per annum, which is £16,500 in excess of the present income, viz.:-

	£	£	£
Interest and other charges ...			69,000
Ground Rents ...	41,000		
Less Grammar School Rent charges ...		3000	
		38,000	
Rent of Premises	18,500		
Less outgoings ...		4000	
		14,500	
			52,000
Deficiency ...			£16,500

This deficiency has to be provided from the rates, and since the scheme was initiated in 1876, sums varying from £460 in 1876 to £25,000 in 1891, and £17,000 in 1898-9, and making a total up to the present time of £234,607, have been provided by the ratepayers. The annual contributions from the rates will continue to be reduced every year until the loans are paid off, about forty-four years hence. The undertaking will then be free of charge, and the whole of the net rental income of, say, £53,000 per annum can be carried to the credit of the funds of the city.

Speaking of this income, the Town Clerks say: "This income will be further increased some fifteen years later by the expiration of the leases which are for seventy-five years, and the consequent reversion to the Corporation of the valuable land, with the costly buildings which have been erected thereon in Corporation Street and the adjoining thoroughfares. It is difficult to form even an approximate estimate so far ahead of what this increase will amount to, but if no great change takes place in the value of property in the city during the interval it may be safely assumed that the Corporation will then be in possession of a clear income of over £100,000 per annum from the scheme."

From calculations made by the Town Clerk it appears that if the £100,000 per annum, the ultimate estimated rental, were capitalised at 3 per cent., and the necessary deduction made for the difference in date at which the full benefit accrues, the result would be about £3,000,000, or about the same sum as the contributions from the rates would realise at 3 per cent. compound interest. Mr. Smith says: "The scheme will have, in fact, formed a kind of savings bank for the benefit of posterity, while the sacrifice made by the present ratepayers has had its reward in the street improvements, increased rateable value, vastly improved sanitary condition of the area, involving a greatly decreased death rate, and the impetus that has been given by the construction of the new streets to the trade of the city, and the general circulation of money occasioned by the improvements."

The Town Clerk's paper to which I have alluded was read to the Royal Statistical Society in 1895, and I would refer to it anyone interested in the subject for further information as to the financial aspect of the Birmingham Scheme. I have taken large extracts from the paper, and have to acknowledge my indebtedness to Mr. Smith.

As before mentioned, the Corporation have themselves erected workmen's dwellings upon the area acquired.

They would gladly have allowed private persons to provide suitable dwellings for the working class on the cleared ground, but with the exception of the land on which the sixty-two houses mentioned above were erected, none

was let for the purpose. It was consequently proposed by the Improvement Committee that the Corporation should sanction the expenditure of £5250 on the erection of a block of model dwellings on the flat system, but this proposal was not accepted. Some time afterwards the Council sanctioned the erection of twenty-two through cottages before mentioned at an estimated cost of £4000. These dwellings were at once let to respectable tenants at 5s. 6d. per week. The applications were largely in excess of the number of houses.

Encouraged by the first experiment, the Corporation afterwards embarked on the erection of eighty-one additional artisans' dwellings at a cost of about £14,000. These houses are similar to those previously built, their accommodation consisting of a front living room 13ft. by 12ft. 6in.; front bed room, first floor, 13ft. by 12ft. 6in.; kitchen 12ft. by 9ft.; back bed room 12ft. by 9ft.; and attic 13ft. by 13ft.; a separate w.c. being provided for each family. There is an asphalted or concreted yard common to each block, and washhouses in proportion to the number of dwellings. These houses are let at rents of 6s., 5s. 6d., 6s. per week, and produce a net income of £790 per annum, which, after providing for the interest and sinking fund, is sufficient to pay an average ground rent, spread over seventy-five years, of 10d. per square yard per annum. As I have already mentioned, the Local Government Board always insist on the erection of dwellings for the working classes on the area acquired.

It may be interesting to give a few particulars of the different kinds of dwellings that have come under my notice. The dwellings erected by the Birmingham Corporation in Ryder Street I have already described. In Dublin the Corporation erected five-story flats, dual houses, and one-story cottages. In Liverpool, five and six-story flats, and in Manchester the same course was followed; but in each of these cities huge flats have been abandoned and the dual houses are now in favour. In London the flat system, by reason of scarcity of land, seems imperative. Under the Act of 1890 the Birmingham Corporation have formulated a small scheme for the removal of an insanitary area in Milk Street, the site being near to the centre of the town. The acquisition of the land and of the buildings necessitated an expenditure of about £6000.

Under the Provisional Order the Corporation are required to house 170 persons of the working classes, and for this purpose the City Council have recently adopted plans prepared by my successor, Mr. Tart, on the dual house principle.

The tenements are arranged in four terraces, and comprise twenty-four houses, each containing one living room and one bedroom, and thirty-seven containing more than one bedroom.

The rooms average:-

Living room ...	13ft. 4in. by 14ft.
Bedroom ...	8ft. 2in. by 14ft.
Bedroom ...	9ft. by 9ft.

The small bedroom is designed for children only.

The rents have been fixed at 1s. 6d. per week for living rooms, that is 3s. and 4s. 6d. per dwelling; each tenement will be provided with a separate w.c., scullery accommodation and ash receptacle. The upper story is approached from a balcony, and this design permits each door and window to have the maximum sunlight and air.

The financial aspect of the Milk Street scheme is as follows:-

	£	s.	d.
Estimated cost of building, including paving, &c., is ...	8975	0	0
Road-making ...	146	0	0
Contingencies ...	897	0	0
Land at 5s. per yard (4030 yards) ...	1007	0	0
	£11,025	0	0

The estimated annual statement will be:-

Dr.	£	s.	d.	Cr.	£	s.	d.
Interest and sinking fund on	£11,025	441	0	0	rental	659	2
				Outgoings	219	14	0
	£441	0	0		£439	8	0

The Improvement Committee in their report to the Council state that:-

"The cost of the Milk Street site was £6000. Deducting the £1007 charged to the houses from this sum leaves £4993 to be provided for. The interest and sinking fund will amount to £199, and this annual payment from the rates must be considered as the City's payment for the sanitary improvement thus made."

As municipal representatives are aware, the housing of the working classes is a most difficult problem, and any scheme which is formulated receives considerable opposition. It is difficult to provide for a population of so diverse a character as the working classes. What I may term the respectable element is hampered and weighed down by a number of thriftless and unclean people who abuse any provision which is made for them. Possibly, this difficulty may be removed in the future by universal education, but I am afraid that many years will elapse before the dwellings which municipalities so liberally provide will be appreciated and used to the best advantage.

Part 2 of the Act is utilised at present by local authorities for the purpose of closing isolated houses or groups of houses which are unfit for habitation, because their condition is dangerous or injurious to health.

I am afraid that the operations of authorities are frequently hindered by the reluctance which magistrates sometimes exhibit in making the necessary orders. In many instances the justices appear to disregard the evidence of medical men and surveyors skilled in the subject; and as the authorities have no power to appeal against the magistrate's decision, a great many insanitary dwellings continue to exist. There can be no doubt that this is one of the greatest blots on the Act, and until it is removed no lasting and permanent benefit can ensue. The subject of appeal has, I believe, been discussed by the Municipal Corporations Association at the instance of the Nottingham Corporation, and I sincerely trust that some result may follow their deliberations.

This part of the Act also provides machinery to enable local authorities to purchase houses, in order to open up alleys and courts. If a medical officer finds that any building, although not in itself unfit for habitation, is so situated that by reason of its proximity to, or contact with, any other buildings it stops ventilation, or conduces to other buildings being unfit for habitation, or if it prevents proper measures being carried out to remedy a nuisance which is injurious to health, he may represent such first-mentioned building as an obstructive building, whereupon the local authority may take steps to secure its removal.

It is worthy of note that the local authority will only have to pay compensation for the actual space taken, and will not be obliged to buy the whole of the owner's land, but will only bear the cost of the severance.

Under the third part of the Act the Local Authority is empowered to provide lodging houses or cottages for the working classes. Several municipalities have acted under this part of the Act, viz.:-Manchester, Southampton, Glasgow, &c. It is however, beyond the scope of this paper to discuss the character of the buildings provided.

In conclusion, I can only add that it is a matter of deep regret that many of the houses inhabited by the working class are not in the state of repair they should be, and that infectious diseases claim the majority of their victims from these houses. A wide field is offered in most towns for the application of both Parts I. and II. of the Act, for there is no doubt that as the landlords execute as few repairs as possible, the decay of the property increases year by year, and the classes of tenants thereby degenerate. If the Local Authority do not step in, area after area becomes insanitary. In many of our large towns there exist courts and alleys without number where perpetrators of crime and vice congregate. It is to be earnestly hoped that Municipal Representatives will study closely the provision of the housing of the Working Classes Act, so that these plague spots may be abolished, light and air admitted, and the lives of the working men rendered brighter and happier.

## YOUNG & MARTEN'S DINNER.

THE fifth annual heads of staff dinner of Messrs. Young and Marten, the well-known firm of builders' ironmongers, was held on February 18th, at the Holborn restaurant. Mr. H. Holdich Marten presided, and the vice-chair was occupied by Mr. E. Montague Edwards, the general manager. After the usual loyal toasts Mr. Montague Edwards submitted "The prosperity of the firm, and health of our esteemed chairman." In the course of his speech, Mr. Edwards remarked upon the rapid strides the business had taken during the past year, a result due in large measure, he thought, to the issue of the new general catalogue. Referring to the projected extension of premises at Maryland Point, Mr. Edwards said the scheme had now been adopted, and before they met next year the new warehouse would be completed, and in thorough working order. One of the essentials of success of any firm was promptitude of despatch, and this new warehouse should enable them to execute orders of whatever kind and forward the same day as received. Thanks to the energies of their representatives, and the catalogue just mentioned, their difficulty in the past had been the need of sufficient stock-rooms, but this would now be overcome, and he hoped the travellers would double their returns. In addition to the Point premises, the firm had acquired a large wharf on the Thames at Millwall. It was intended to publish an export catalogue shortly, and he was sure that the response to that, coupled with the increased facilities at their disposal, would bring a satisfactory return this year.

In replying, the Chairman said that Mr. Edwards had placed before them the few chief points of interest in his able remarks, and no one was more competent to speak upon them than he. Two years ago they celebrated the twenty-fifth anniversary of their firm, representing its growth from infancy to manhood, since then he ventured to say that the progress made had been surpassed by few firms in London. The great event last year was the launching of their complete catalogue on the sea of commerce, and the results had fulfilled all expectations; but without the hearty co-operation and the prompt and efficient treatment of the business thus brought, the success would not have been so great. The business of the first month of this year had shown a very considerable increase over the corresponding month of last year, and he felt sure with their assistance this satisfactory state of affairs would continue. In the course of some very eulogistic remarks in regard Mr. E. Montague Edwards, Mr. Marten said he hoped that gentleman would be spared for very many years to fill the proud position which he so justly occupied in the firm of Young and Marten. With regard to the staff, he felt very proud of the body of men who made his interests their own. One of the features of last year's trading was that there was not a single department which had not made an advance upon the preceding year's returns. It was his intention to convert the business this year into a Limited Liability Company, his only object being for family reasons, to define his own interests in the firm and that of an old and valued friend who had been interested in the business for many years. It would not make any difference in the management of the firm, everybody would go on the same as usual. Mr. Edwards would go on in the same position as now, only instead of general manager he would be managing director. It would not make the slightest difference to the welfare of the business, and all he could say in conclusion was, that if in the future as in the past, their heart was in the work, when next they met there would be nothing but success to convey to them. Mr. Marten concluded by proposing the toast of "Our General Manager and the Staff of Young and Marten."

The toast having been drunk with acclamation, Mr. Edwards replied, expressing his sense of the generous treatment the staff had always received from the head of the firm. Mr. Marten had always been ready to distri-

bute a percentage of the profits in salary. Whenever names had been mentioned to him as being worthy, he had invariably responded, and if there was an unselfish man connected with the firm it was their esteemed chairman. Whatever had been achieved he had been a party to it, and to him in a large measure must be the credit.

Mr. Frank Marten proposed "The Dinner Committee," and Mr. J. B. Lupton (head of the Leytonstone Branch) responded.

A well-arranged programme of music was successfully carried out, and altogether the proceedings were of a thoroughly enjoyable character.

## WATER GAS.

THE report of the Departmental Committee on the manufacture and use of water gas has been issued. The report states that in the United States about 70 per cent. of all the illuminating gas supplied was in 1896 carburetted water gas, and the Committee were informed that the distribution of this gas is still increasing rapidly. In Great Britain there is at the present time plant capable of producing 70 or 80 million cubic feet of carburetted water gas per day, and if this plant were worked to its full capacity it would produce about 24 per cent. of all the illuminating gas supplied in Great Britain last year. The Committee say they are satisfied that the advantages which many gas managers see in the gas may well lead to an increase in its use. They draw attention to the "emergency value" of water gas. Where a heavy fog creates a sudden demand for increased output of ordinary gas, the situation can only be met in default of great storage by putting reserve plant into operation. If coal gas retorts alone are available, it will, the Committee say, take two or three days to bring them into action, whereas if there be carburetted water gas plant in reserve, it can be started in a very few hours, and made to produce gas with great rapidity. The Committee deal at length with the danger of the manufacture and use of water gas, and they consider that the unrestricted distribution and use of it would constitute a substantial danger, and they submit that it ought to be prevented without undue restriction. The report mentions that the danger is not confined to accidents. The American figures show that it is being increasingly used for suicidal and even homicidal purposes, and the facility with which murder, particularly child murder, bearing all the appearance of accident, could be committed by simply turning on in a small room a jet of gas containing a large proportion of carbonic oxide, seems to them (the Committee) to afford an additional reason for restricting the use of carburetted water gas. The main suggestions are that it should be illegal for any person to make and distribute any poisonous gas which does not possess a distinct and pungent smell, and that if there be any water gas in a gas supply, the fact should be stated on every demand note.

**Bradford Sewage Problem.**—The Local Government Board held an inquiry at Bradford on March 1st and 2nd into the application of the Corporation for a provisional order empowering them to acquire the Esholt estate of 353 acres for sewage works, the present works at Frizinghall being only capable of treating one-fifth of Bradford's sewage. Under the proposed scheme the sewage would be conveyed by a tunnel 8ft. in diameter and 2½ miles in length to Esholt, with a syphon half a mile long. Fourteen tanks would be erected, each capable of treating 675,000 gallons per day. The Corporation proposes to adopt (1) the precipitation system, (2) the bacterial system, and (last) land filtration. Special treatment is required for the Bradford sewage, owing to its containing a large amount of fat, which must be physically separated. The resultant effluent would, after this separation, be treated with ferric sulphate, when it would be capable of bacterial and land filtration treatment.

## Masters and Men.

**The Clyde Engineers,** following the example of their brethren on the north-east coast, have applied for an increase of five per cent. on the present rate of wages.

**Strike of Aberdeen Painters.**—Last Wednesday the operative painters in Aberdeen, to the number of about 400 struck work for a rise of 1d. per hour on the present rate of wages of 7½d. The masters offered ½d. increase, and there is a feeling that the men would be prepared to compromise for ¼d.

**Engineers and Overtime.**—A number of engineers employed by an Oldham firm of cycle and sewing machine makers have been dismissed, the reason assigned being that the workmen had refused to work overtime under certain conditions. At the works in question it has been a rule to pay time and a quarter for all overtime worked; but notice has lately been given that in future only the ordinary rate of pay would be given. The men refused to work overtime under these conditions, and several of them have in consequence been dismissed. The Amalgamated Society of Engineers will, it is expected, take the matter up.

**Engineers' Wages in Lancashire.**—The wages question in the Mid-Lancashire engineering trades will probably come before a conference of the Engineers' Federation Executive and representatives of the engineers' trade unions within a fortnight or so. Mr. G. N. Barnes, the general secretary of the Amalgamated Society of Engineers, has stated to a correspondent that a number of questions had been accumulating of late for the consideration of the conference. This Mid-Lancashire wages question was one which had become acute from the fact that in nearly every other locality in the country advances had recently been given, which left Bolton and district behind the others. At the same time that the Bolton wages were being considered the engineers would have before them wages in the Newcastle district, and in Halifax and neighbourhood. If advances were granted in these districts, then wages would have been raised practically all round the country.

**Scottish Joiners.**—In conjunction with the associated joiners of the district, Hamilton joiners have made an application for an advance of ½d. per hour in their wages. Masters have offered ¼d. from March 1st, and ½d. three months later. The men have refused this offer and are expected to take measures to enforce their demand. The Master Joiners of Motherwell and district have decided not to accede to the demand of the employees for an advance in wages from 8½d. to 9d. per hour. The masters offered as a compromise ¼d. per hour now, and another ¼d. three months hence, but this was refused.—A similar demand made by the joiners of Airdrie and Coatbridge has also met with a refusal, except in the case of one firm at Coatbridge. The Airdrie masters offered a ¼d., which was rejected by the men. It has been resolved to come out on strike, except in the case of the firm which has conceded the advance.—At Wishaw also the joiners are on strike.

**An International Exhibition** is to be held at Glasgow in 1901. At a meeting held at the Mansion House last Thursday for the purpose of appointing a London honorary consultative committee, the Lord Mayor said he looked forward with confidence to 9,000,000 visitors and a profit of £80,000.

**A Memorial Tablet to Bishop Butler** has been placed in Durham Cathedral, and was unveiled last week. The tablet has been designed by Mr. T. Erat Harrison, of Bedford Park, London. The upper part is decorative, while the lower part carries an inscription specially written for the purpose by the late Mr. W. E. Gladstone, flanked by the coat of arms of Bristol and Durham, the arms of Butler being impaled with those of his two sees.

## THE PLASTERERS' DISPUTE.

### THE LOCK-OUT BEGUN.

THE lock-out in the building-trade, which has been so long impending, began at noon on Saturday last, and on Monday morning the only plasterers who were taken on in those shops that have thrown in their lot with the National Association of Master Builders, were those who gave an assurance that they were not members of the National Association of Operative Plasterers. The last communications that passed between the secretaries of the rival bodies are given below. It will be remembered that Mr. Deller, while declining to accede to the masters' demands, had suggested a conference at which the accusations of objectionable practices might be discussed, and—so he maintained—disproved. Mr. Hassall's reply to this was as follows:

"I am instructed to inform you that, in reference to your suggestion that the employers should meet you in conference, it will be necessary to have from your council, in writing, the proposals you intend to submit for their consideration at such conference. The necessity for this must be evident, as up to the present the demands of the employers have been met with a point-blank refusal. As to existing local agreements (none of which sanction the objectionable practices referred to in my previous letters), there will be no difficulty in dealing with these in the event of an understanding being arrived at on the principles at issue, as set out in my letter of Feb. 11. They can be adjusted if necessary by mutual arrangement, or terminated by due notice. Having regard to your replies, my committee do not consider they are justified in altering the decision of which you had due and timely notice on Feb. 22."

To this letter, Mr. Deller replied in the following terms:—

"I regret to find by your letter of yesterday, that your association has practically refused to meet us—that, to my mind being the only interpretation that can be placed upon it. As you have been previously informed, we have no proposals to make, but we are prepared to challenge, and deny the truth of some, and to uphold our right to other statements made by you in yours of Feb. 1. It is also a matter for regret that your association should declare a lock-out in the provinces of members of my association, in spite of the fact that agreements exist, whereby your action becomes dishonourable, and further forcing the Master Plasterers, over whom you have no control—except as a sub-contractor—to lock out also. To sum your letter up, it embodies the whole of the charges urged against us as applicable to your association, and goes to confirm the opinion at first formed by my council, that you set out to fight, and nothing but a fight would appease your desire for our annihilation; and further, had we conceded all your demands, there could be no reliance upon any settlement made being honourably carried out, and I trust that now the Press and the public may be able to see that the poor plasterer is not quite so black as he is painted, or even so arrogant and tyrannical as his accusers."

Now that the battle has begun a good deal of interest turns on the amount of support either side will receive. From the reports which, up to the time of writing, have come to hand from the provinces, it would appear that there is a very general determination amongst master builders throughout the country to support the policy of the National Association. The men for their part are astonishingly unanimous in their determination to reject the employers' terms. In the first stages of the dispute the men were by no means united, but now there is no wavering. The ballot taken last week has resulted in 10,211 answering in the affirmative the question, "Do you approve the action of your executive committee in their conduct of the negotiations with the masters?" and only 36 in the negative. The second question on the ballot paper: "Are you prepared to submit to the employers' terms as laid down in the letter of February 1st?" was answered in the affirmative by 36,

and in the negative by 10,176. Whether the plasterers will receive the support of the other unions in the building trades is very doubtful, as it is well known that their relations with some of these unions are by no means of a friendly character.

And what of public opinion? For that, in the long run, is an important factor in every trade dispute. One of the most remarkable features of this dispute is the practical unanimity of the Press of all shades of opinion in condemnation of the attitude taken up by the Plasterers' Union, though of course the condemnation expressed is in varying degrees of severity.

## Builders' Notes.

**Wellington Parish Church** is being fitted with the latest improved "Small Tube" Hot Water Apparatus by John King Limited, of Liverpool, who are employing their special Economical Coil Heater with Waterway fire-bars.

**The New Portsea Naval Barracks** contract has been secured from the Admiralty by Messrs. Lovatt and Company, of London, who are now completing the new jetty at the dock-yards. The barracks will replace the present wooden hulks as a naval dépôt for the port, and are to accommodate 4800 men. They will cost £400,000, and take four years to build.

**Proposed Bridge across the Tyne.**—The amended estimate for the proposed new Tyne Bridge between Newcastle and Gateshead has been published and distributed amongst members of the city and borough. For bridge structure, extra width and weight as agreed upon by joint committees, flagging and paving the new portions of the streets at each end of bridge, and also the widening of the arch and roadway under the North-Eastern Railway, Pilgrim Street, Newcastle, £200,000. Properties to be acquired on the Newcastle side, £250,000. Properties to be acquired on the Gateshead side, £76,000. Interest on capital during construction, £11,500. Engineering expenses, law charges, and contingencies, £22,500; or a total of £560,000.

**The Builders' Clerks' Benevolent Institution** held its thirty-second annual meeting on the 28th Feb., at the offices, 21, New Bridge-street, Mr. A. F. Randall, president-elect, occupying the chair. The report stated that the receipts during the past year were as follows:—Annual subscriptions, £226 16s.; donations, £494 5s. 6d.; dividend on stock, £151 18s. 8d.; interest on deposit, £5 13s. 11d.; and the balance in favour of the institution from the annual dinner account, £10 0s. 8d. The total disbursements were £606 11s. 8d., out of which a sum of £484 was paid away in pensions, while £20 was distributed in temporary relief. At the end of the year there were twenty recipients of the annual pension, and also two children in the Orphan Working School on the presentation of the institution.

**Charles P. Kinnell and Co. Limited.**—We are informed by Messrs. Charles P. Kinnell and Company, the well-known hot-water engineers, boiler makers, and ironfounders, &c., of 65 and 65A, Southwark Street, London, S.E., that as from January 1st, 1899, they have resolved themselves into a public limited liability company, the whole of the responsibilities of the late firm have been taken over by the new company, and will be discharged by Chas. P. Kinnell and Co. Limited. No shares or debentures in the company have been allotted to the public. The business will be continued as in the past under the title of Chas. P. Kinnell and Company with the necessary qualification "Limited." The alteration in the constitution of the firm has arisen through family reasons only. The responsible working partners of Chas. P. Kinnell and Company will form the directorate of the new company.

## Engineering Notes.

**Gas at Leeds.**—It is proposed to spend on the gas mains in this town £14,402 in enlargements, and £97,278 in extensions.

**Stourbridge Junction** is to be extensively improved by the Great Western Railway Company, and a station is to be erected at Chawnhill.

**Kelty Reservoir**, at Loch Glow, on the Cleish Hills, in Fife, on Thursday bursts its banks and wrought considerable destruction.

**Plans for an Iron Footbridge** between Market Street and Roodyards Road, Dundee, have been prepared by Mr. Buchanan, harbour engineer. The estimated cost is £4750.

**Hull Electric Lighting.**—The Local Government Board held an enquiry last week into an application made by the City Council of Hull for sanction to borrow £16,000 for electric lighting purposes.

**In succession to Mr. W. H. Preece, C.B.**, Mr. J. Hooke, previously the assistant engineer-in-chief, has been appointed the engineer-in-chief of the Post Office. Mr. J. Gavey has been appointed the assistant engineer-in-chief and electrician.

**The London County Council's Engineering Contracts.**—At last week's meeting of the London County Council Mr. Beachcroft presented a petition from the London and District Association of engineering and ship-building employers asking the Council to modify the terms of its contracts with a view to putting the London engineering trade on an equal footing with its competitors outside the London area. Mr. Beachcroft, in moving that the petition should be referred to the General Purposes Committee and the Building Act Committee, said that the petition emanated from sixty firms paying £1,200,000 a year. The motion was agreed to.

**Midland Gas Managers.**—The annual meeting of the Midland Association of Gas Managers was held last Thursday at Birmingham, Mr. J. S. Reeves (Bilston) presiding. In the course of his presidential address, the Chairman dealt with various phases of gas-works construction and management. With regard to gasholder construction, he said it did not appear that any new departure had to be chronicled. The enormously large structure erected by Mr. Livesey at the East Greenwich works was a record which, if equalled, was not likely to be exceeded. The tank and gasholder in course of construction at the Salthley Gasworks—which, through the courtesy of Mr. Hack and his Gas Committee, they were privileged to see something of at their last meeting—would, however, when completed, be the nearest approximation in size to the East Greenwich holder, and be the second largest holder in the world. Not the least gratifying feature in connection with the huge holder at Salthley, and the extensions that were being carried out therewith, was the irrefragable testimony borne to the growing character of their industry—and that in the presence of keen competition with its rival, the electric light, supplied under municipal management and probably under conditions most favourable to its extension. What was taking place in Birmingham in regard to gas-works extension, applied in a lesser measure to most of the manufacturing towns of the kingdom. The chief cause of this growth doubtless was the extended use of prepayment meters. From experience, he could speak most favourably of them. There was, of course, a considerable amount of extra trouble entailed in working those meters; but the trouble was paid for in the increase of revenue from the sales of gas, and undoubtedly the system was appreciated by the industrial portion of the community, on whom it conferred a larger measure of safety and comfort.

Surveying and Sanitary Notes.

**The Widening of Cheapside.**—A start has been made towards pulling down business premises having frontages in Cheapside and St. Paul's Churchyard, with a view to the widening of the western entrance to Cheapside. In rebuilding, the street line will be moved back several feet. The improvement scheme also provides for the widening of the roadway at the junction of Newgate Street and Cheapside.

**Dublin City Improvements.**—The Local Government Board held an inquiry at the City Hall last week into a petition of the Dublin Corporation for a provisional order to enable them to compulsorily acquire sites for fire brigade stations; also an application made by the Corporation for the sanction of sums amounting to £31,000 and £1400 for paving, concreting, asphaltting, &c., and £7000 for electric purposes.

**New Sanitary Powers for the L.C.C.**—The House of Lords, on the 27th February, passed the motion of Lord Monkswell, L.C.C., the Metropolitan Management Acts Amendment (by-laws) Bill passed its second reading. The Bill is designed to enable the London County Council to make bye-laws "requiring persons about to construct, reconstruct, or alter drains in connection with buildings to deposit with the sanitary authority of the district such plans, sections, and particulars as may be necessary for the purpose of ascertaining whether such construction, reconstruction, or alteration is in accordance with the statutory provisions relative thereto, and with any bye-laws made under the said section."

**Perth Auxiliary Drainage Scheme.**—The Work and Paving Committee of Perth City Council have resolved to recommend for adoption plans for a new sewer, which will drain the north part of the city, and will extend from Muirton Bank to the existing catch sewer, which it will join at the junction of Canal Street and Tay Street. The circumstances which render the proposed

scheme imperative are the extremely congested condition of the sewers in Atholl Street, North Port, and Castle Gable, the flat gradient in Rose Terrace, the want of drainage for the properties at Muirton Bank, and the want of a sewer to drain the properties to the south of Charlotte Street. The estimated cost of the new sewer is £6950.

**Leeds Sanitary Inspectors.**—The duties of the Leeds sanitary inspectors are being rearranged. A sub-committee of the Town Council has recommended the appointment of four additional male inspectors, which will bring the total number up to twenty. An endeavour is to be made to carry out a system of house to house visitation. At present only the houses where fever cases have occurred, where alterations are being made to the drains, or dwellings in respect of which complaints have been forwarded to the Sanitary Department, are visited. The idea of the sub-committee is that in the interests of the prevention of disease every house in the city should be visited by a sanitary inspector at least once in four years. This system the sub-committee are of opinion should be commenced forthwith, and with that object they recommend that each of the twenty inspectors devote four half-days a week to house-to-house visitation work. The sub-committee likewise ask the Corporation to appoint two more inspectors, who shall be females.

**The Strand and Clare Market Improvements.**—Mr. H. T. Steward, F.S.I. (Messrs. Hunt and Steward, 45, Parliament Street, S.W.), the arbitrator appointed to decide the value of properties acquired by the London County Council under the Housing of the Working Classes Act 1890, in connection with the Strand and Clare Market scheme, in his inquiry had first to consider the claim in respect of the Hope Tavern, Blackmoor Street, which is held on lease for a term of which twenty years are unexpired at Lady Day next at £70 a year. Mr. Thomas J. Weaver, public-house valuer, Theobald's Road, W.C., expressed the opinion that £8000 could be got as a premium for a sixty years' lease. Witness had applied the 4 per cent. table. He valued the rental of £70 a year at a twenty years' purchase, and a shed at the rear at £237. His total valuation, including the usual 10 per cent for

forced sale, was £6567. These figures were supported by the evidence of other experts. On behalf of the London County Council Mr. Thornton (Messrs. Thornton, Lumsden, and Newman, 15, Coleman Street, E.C.) and Mr. Weatherall, F.S.I. (Messrs. Weatherall and Green, 22, Chancery Lane) had taken the rental of £70 a year on the 4 per cent. table £952; value in possession, £100 per annum, £1919; 4 per cent. table, twenty-five years' purchase, £2500. The total valuation was £3362. In regard to the Grapes Tavern, Drury Lane, and the Artichoke, Clare Street, the arbitrator was asked to make an award of £3647 and £7200 respectively.

Trade and Craft.

A NEW FUEL FOR BOILERS.

The Perfecta Seamless Tube Company are exploiting a new invention which promises great things in the way of fuel saving. In the place of coal they use oil in a high state of evaporation, and claim that the result is a saving of at least 50 per cent. in energy. The idea is French in origin, but it has remained for the practical English mind to give it workable commercial value. A trial was made recently at the works of the Perfecta Seamless Tube Company at Aston. A large Lancashire boiler was used, the face being slightly modified to allow of the entry of the tubes containing the mingled air and oil. A few embers under the tubes in the mouth of the furnace swiftly vaporized the oil, and it projected itself in a terrific sheet of flame. In a remarkably small space of time the water in the boiler rose in temperature until boiling point was reached. Little attention was needed, and naturally there is no stoking or trouble with ashes. Here are the advantages of the system as set forth by the Company:—By means of the vaporised oil 12lb. of water can be evaporated per lb. of fuel as compared with an average of 5lb. per lb. of fuel in a boiler of the ordinary Lancashire type; no smoke is produced by the oil, and a much smaller space of grate surface is needed than when coal is used. The new fuel may be used in any class of boiler.

## Property and Land Sales.

**HEMILE PARK**, near Cobham, Surrey.—A FREEHOLD BUILDING ESTATE of about 40 acres, with possession.

**MESSRS. DRIVER and CO.** have received instructions to offer to AUCTION at the MART, Kenhouse-yard, Lothbury, NEXT SPRING (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairlie Station, and about a mile and a half from Cobham. The estate comprises Building Land, ripe for reclamation, the higher portion (sloping to the south) possessing charming views over the intervening country Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, ne Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and 1 is included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of **MR. J. J. JUPP, Esq., Solicitor**, 48, Lime-street, E.C.; or of **Messrs. DRIVER and Co.**, 23, Pall Mall, S.W.

**order of Trustees.**—Preliminary Advertisement.—Freehold Building Estate, Streatham, near West Norwood Railway Station.

**MESSRS. FIELD and SONS**, and **Messrs. WILFORD and WILSHIN**, who are jointly concerned, will SELL by AUCTION, at the MART, at an early date, a valuable FREEHOLD BUILDING ESTATE, known as High View Park, comprising 16a. 10p., lying immediately at the rear of and with approach from Leigham Court-road; also a contiguous Freehold Building Site of 2a. and 5p. in a new road intended to connect Canterbury-grove with Thurby-ld.

Particulars and plan, in due course, of **Messrs. KINGSDORF, DORMAN, and Co., Solicitors**, 23, Essex-street, Strand; of **Messrs. WILFORD and WILSHIN, Auctioneers**, Anerley, S.E.; and of **Messrs. FIELD and SONS**, above.

**Land Syndicates, Building Societies, Capitalists, and others.**

**FREEHOLD.**—Important Freehold Building Estate of over 7 acres, with residence, known as Barrow Point, occupying a beautiful position close to the quaint old village of Pinner, within five minutes from the railway station on the Metropolitan line, and extending to within about 3 of a mile of Pinner Station on the London and North-Western Railway, having easy access from the West-end and City. The whole ripe for immediate building operations, and admirably adapted for villa residences of a superior class.

**MESSRS. FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY**, and others, beg to announce that the above valuable PROPERTY, which they recently offered for Sale by Auction, may now be treated for privately.

No. 29, Fleet Street, Temple Bar, and 18, Old Broad Street, E.C.

**FREEHOLD OAK.**—Important Sale of FREEHOLD BUILDING LAND, forming an appreciable portion of one of the most salubrious and rapidly-increasing suburbs of the City of London, with numerous railway facilities to all parts of the metropolis, and presenting admirable sites for the erection of private Residences.

**MESSRS. FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY**, and others, are prepared to SELL the few REMAINING LOTS in the above FREEHOLD BUILDING ESTATE, by private Contract.

No. 29, Fleet-street, Temple-bar, and 18, Old Broad-street, E.C.

**SANITARY INSPECTORS' EXAMINATIONS.**—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above exams, by correspondence; no books are required.—For particulars and testimonials apply, "Certified," 31, Herbert-road, Plumstead, S.E. 10

**WILFORD and MALLOWS, Architectural Draughtsmen and Quantity Surveyors**, 21, Buckingham-street, Strand, W.C. 1

**I.B.A. EXAMS. PREPARATION**, personally or by correspondence, in three, six, or twelve months' courses. Architectural Drawing Library. Special three months' finishing courses.—For full particulars apply to **Messrs. WILFORD and BOND, Associates I.B.A.**, Perchard House, 70, Gower-street, W.C. (close to the British Museum).

**I.B.A., SOCIETY OF ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS.** Preparation by correspondence, in residence, personally.—MIDDLETON and CARDEN, 19, Craven-street, Strand, W.C.

**NO ARCHITECTS, UPHOLSTERERS, and Trade generally.** DECORATIONS in any style, on reasonable terms. Town or country.—HATHERLEY, Great Pulteney-street, W. 3

NOW READY. Price Four Shillings.

## An Architectural Causerie.

BELOW the brow of A Cotton Town. Wardle Hill is the town of Wolmington. wintry sun is in the heavens, seen through veil of smoke and dirty fog that clings about the lower portions of the many chimney shafts, and intervenes a grey and sombre ground, between the earth and sky. The sun sets in a dark red sky, and the black smoke from the chimney curls away against the red glow. The streets and pavements are below, and a little later, at the sound of the buzzer, epicene forms pour out through the mill gates and pass along the flags, and rising to the top of Wardle Hill, through the smoke and fog comes the unmistakable sound of clattering clogs, the shrill laughter of factory lasses, and the less frequent and deeper tones of the workman. Change comes quickly; in three or four hours the wind has risen, and comes whispering across the moorland to the rear of Wardle Hill, rising to a shrill whistle as it dips over the hill top, dying away into a melancholy whimper as it weeps towards Blackedges, a range of hills in the far distance. The wind rises and falls, rustling round the tapering shafts, shifting the little streams of smoke that rise from the fires, and carries the fog and noxious vapours away till the boundaries of Wolmington can just be seen. The town lies in a hollow, flanked on one side by Wardle Hill, and on the other by the river Aire; to the left the town tails off with suburban residences of usual design, and terminates to the right with the railway station. Near the middle is the home of the co-operative movement, towering high above the surrounding buildings; further away, in the direction of the terminus, is the fire station, and just below the hill is situated the new Technical School; here and there are a few thin-looking spires, and halfway up the side of Wardle Hill stands the ancient parish church, contrasting strangely with the sturdy and numerous chimney shafts that taper upwards from every part of the town; street after street of two-storied workmen's dwellings of the same design, occasional waste spaces covered with ashes, and a mill rising in the background. This can be seen distinctly in the now clear atmosphere. The rays of a full moon, which has long breasted the hill, falls upon the buildings and quiet streets. On the ridge of a new inn, called the "Black Owl," stalks a philosophic cat, who looks down upon the town with a pleased and complacent air. "This is progress," thinks the philosophic one, and suddenly disappears over the end, his tail waving in the moonlight for a moment as he grips the gable wall for his last jump. Far away in the distance are some upstanding monoliths, older than the parish church—rude stone monuments that mark the resting-place of the builders who laid the foundations of modern Wolmington. G. LL. M.

### The Teaching of Design.

THE well-known story of the writer who began a work upon "Snakes in Ireland" with the sentence, "There are no snakes in Ireland," seems applicable here—"The Teaching of Design." Design cannot be taught. The power of designing cannot be communicated, for the designer is like the poet—born, not made; though it is not intended to assert that his development may not be aided or hindered by the course of study through which he passes, if the divine spark be there. What can be taught is the mechanical part of the business, just as in drawing, the perception of balance and proportion, the accurate triangulation of the figure and the relations of points and lines, the retirement of planes and measuring of tone values by the eye may be gradually hammered in to the student who is not an artist at heart. But all teaching is negative;

which he works, must necessarily be able to design for it, and that the way to produce fine things is to turn over the designing of them to him. It is forgotten that the power of design is one thing, the talent for execution quite another, and that although the two may co-exist in the same person, it is at least equally likely that they may be divorced. It is certain that the designer ought to be familiar with the processes of the craft for which he is designing, or he will miss opportunities or plan impossibilities; but that craftsmen left to themselves do not necessarily produce fine works of Art, or progress in power of design, is shown by the example of the German smiths, who, for 150 years, had the whole thing in their own hands, and fell by the usual temptation of the craftsman which lures him on to think that the successful overcoming of difficulties of manipulation is the one thing needful to ensure artistic

Near the Station  
Toledo

DRAWN BY F. HAMILTON JACKSON, R.B.A. (See page 83.)

one can point out where the pupil has gone wrong, can even explain to him sometimes where his work lacks feeling, and show him how it might have been better done; but, after all, the creative impulse must be innate, and, lacking it, the utmost which can be attained is the production of work which shall be inoffensive. The mistake which the old schools of Art made was in supposing that all that was wanted to equip the designer for his work could be learned and provided for him at a desk in a room; that design was a thing quite by itself, a product of nicely strained paper, T-squares and compasses, of dissection of flowers and geometrical diagrams, having little relation to its subsequent rendering, and capable of being judged from the standpoint of abstract æstheticism. We have got beyond that to-day, and the pendulum swings the other way. The gospel preached now is that the craftsman, because he knows the capabilities of the material in

success and give interest to his work. The time-honoured English way of teaching has been by apprenticeship or some analogous arrangement, where the pupil had a hint here and a hint there, but had to puzzle things out for himself for the most part. This had the disadvantage of being a lengthy process, but the possibilities of mistake were exhausted, and the same thing had often to be done in different ways during the period of apprenticeship, which gave the workman aptness in seizing the best way of conquering a difficulty. The system of apprenticeship having decayed, technical schools have been established to take its place, which endeavour to teach the best way of doing each thing, thereby causing the mind of the student to become rigid and formula-ridden. Even for the teaching of technique this is not an ideal mode, while for that to which spontaneity is as the breath of life it must prove asphyxiating. It was not thus that the designers were brought up whose works are now conquering the Continent, whence an ever-increasing demand is coming for English designs and designers. S. S. G.

## On Reflection.

**London Street Traffic.** THE attempts that are being made to deal with the congestion of traffic in the streets of London have given rise to some rather curious recriminations amongst the parties concerned. The "crawling" cabmen, indignant at being turned out of the main streets, where "fares" are usually picked up, demand that the 'buses, which they say are the real causes of the congestion, shall be treated with equal stringency. The Government has lately brought in a Metropolitan Streets Act Amendment Bill, which proposes to give the Chief Commissioner of Police powers to divert omnibuses from their present routes. Against this proposal the bus proprietors are up in arms; they consider the exercise of the powers it is proposed to confer would result in grave injury to themselves and their employees, as well as in great inconvenience to the travelling public. They, in turn, would shift the blame on to the heavy drays and the private carriages, suggesting that the former should be compelled to take the less frequented routes and the latter forbidden to stand for a long time outside shops. It seems almost impossible to deal with this question without inflicting a certain amount of hardship on one section or another of the community. But that it must be dealt with—and that soon—must be evident to everyone. If time is money, the citizens of London must lose thousands of pounds daily in their slow progress between Charing Cross and the Bank. The widening of narrow streets and the increase of underground electric railways may be calculated to effect some improvement, but more than this is necessary, for the congestion, if not checked, will inevitably get worse every year. On the whole, we think the plan of giving the police larger powers in regulating the traffic is the one most likely to effect good results.

### The New Vauxhall Bridge.

MR. WARD, Chairman of the Bridges Committee of the London County Council offered some reply to the meeting last Tuesday week to the influentially signed protest, recently made in the "Times," upon Sir Alexander Binnie's design which we commented on last week. He said he felt that many of those gentlemen who had signed the letter would not have done so had they been cognisant of the facts, and these facts he proceeded to state. The Bridges Committee had received deputations from the Art Committee of the Royal Institute of British Architects on several occasions on the subject, and they had gone a long way to meet the various suggestions which had been received. As a result of a letter the Art Committee was received by the Bridges Committee on May 23, 1894, the president of the Royal Institute of British Architects introducing the deputation. On December 12, 1894, the standing Art Committee of the Institute again saw the committee, and the engineer was instructed to furnish the standing Art Committee with sections of the bridge and give information as to the form of construction. On July 17th, 1895, the Bridges Committee received the third deputation from the architects, who submitted a sketch design for the piers and abutments. This was referred to the engineer for consideration. Several letters passed, and the engineer was instructed to avail himself, as far as desirable, of the suggestions with which the Bridges Committee had been favoured. A model was subsequently prepared of the engineer's design, which included several modifications suggested by the Art Committee, and the engineer invited Mr. Waterhouse and Mr.

Mountford to see the model. On February 19th, 1898, Mr. Waterhouse wrote to Sir A. Binnie congratulating him in the name of himself and Mr. Mountford upon the general design and proposed construction of the bridge. They, however, went on to make some half-dozen further suggestions, and probably three or four of these would be adopted in the carrying out of the working drawings for the superstructure which were being made. It was manifest that the committee had gone a long way to meet the views of the architects, and in the end they felt that the engineer must be responsible for the design, as it would hardly do to put an irresponsible advisory committee in his place. It had been stated that a deputation asked to see the chairman of the Council. The explanation of that was that the clerk opened the letter, and, seeing that it referred to bridges, at once sent it on to the Bridges Committee. The chairman of the Council had stated that he had not seen that letter, but no doubt he would be willing to receive the deputation. The contract for the piers had been let, and the only thing that the committee could now alter was the superstructure. A sketch design had been sent in, but it was so unworkable in many respects that it could not be adopted. This statement of Mr. Ward's is well calculated to throw dust in the eyes of the public, and we notice several papers accept the statement without a word. An examination, however, of the communications which passed between the Institute and the L.C.C., puts a somewhat different complexion on the matter. These were almost entirely confined to the construction of an iron bridge with stone piers, a form of construction subsequently abandoned. The council of the Institute not only laid a sketch before the committee, but furnished suggestions, drawings, and details to scale; but these dealt with an iron bridge, and were not applicable to a bridge completely dressed in stone. The only inter-communication afforded by the engineer was the much-made-of interview with Mr. Waterhouse and Mr. Mountford, which was to be considered informal and confidential, and the confidential letter from Mr. Waterhouse is brought up in defence of the non-submittal of the design to the Institute Council. But the suggestions offered by Mr. Waterhouse and Mr. Mountford were, we learn, more far-reaching than appears at first. The Bridges Committee seems to be afraid to oppose Sir A. Binnie, who cannot be expected to agree to any interference of architects. The Council have need to remember that they and their officials are the servants of the ratepayers, and when they receive deputations from an influential body it is well not to throw aside opinions furnished, on account of one of their highly-paid officials' feelings or prejudices, however important a personage he may appear in their eyes.

### Fog, Smoke, and Electricity.

THE amount of attention that is being devoted just now to the fog fiend encourages the hope that he will soon be out-manceuvred and exterminated. Artists, electricians, and County Councillors have all got their eye upon him. Those enthusiastic folk who have lately been seeking to arouse us from our lethargy on this subject have banded themselves into a society the better to prosecute their aims; Sir William Richmond has consented to become the first president of the new society, and Mr. Owen P. Thomas is its hon. secretary. An experiment which may have some bearing on the question was made by Professor Oliver Lodge in a recent lecture at the Royal Institution. The Professor filled a bell-jar with magnesium smoke, the fumes of which would ordinarily take a long time to disperse. He then passed an electric current through the jar, with the result that the smoke began instantly to clear, the smoke particles uniting

and falling in the form of a white snow of magnesia. This action of the smoke particles is due to what is known as electric cohesion. Now if a jar-full of smoke can be dispersed in this way, why should not the same means be employed on a larger scale to get rid of a fog? An attractive idea, is it not? Dr. Lodge thinks it quite possible that a real fog—that is a fog arising from a moisture-charged atmosphere, quite a different thing from the sulphurous, artificially-made, London variety—might be so dispersed. But the only way, he thinks, to prevent a London fog is not to cause it. People should use gas stoves instead of burning coal fires in open grates, and the gas should be made at the coal fields and conveyed to town in huge pipes and conduits. This does not sound like practical politics, and, indeed, Dr. Lodge admitted that the experiment would have to be tried first in the case of a small town. Scarcely more possible was Mr. Bull's suggestion at a recent meeting of the London County Council that a reward of £1000 should be offered for "a patent smoke consumer adaptable to modern private houses." Sir Harry Poland's parable of the man who had a simple contrivance to prevent cisterns freezing—namely, to remove them from the cold part of the house and take care to keep them warm—induced the Council to reject this fantastic notion. The Smoke Abatement Society would render good service if they could evolve a practical plan of campaign against the smoke nuisance.

### A Senseless Quarrel.

THE little clique of operative plasterers, whose high-handed attempts to enforce an unreasonable demand was the proximate cause of the present trouble in the building trade, must have uneasy consciences just now, if they possess any sense of responsibility, and even a moderate degree of imagination. What the issue of the struggle may be it would be rash to forecast, but this much is morally certain: that before many weeks have passed there will be hunger and cold in the home of many a working man, compelled to idleness through no fault of his own; that there will be many a firm, holding an unblemished record for fair and even generous dealings with its employees, that will be driven to the verge of bankruptcy, or even over the verge. For it is as true in industrial warfare as in the warfare of nations, that it is not those that make the quarrels who suffer most keenly from their effects. It is, of course, a fact that the silly demand about the foremen has long been withdrawn, but those who throw firebrands cannot escape responsibility for the conflagrations they kindle. Yet not all the blame should rest upon the authors of that act of folly. There is beyond doubt a great degree of truth in the charges of objectionable practices that have been made against the plasterers as a whole, though we think these charges have been made somewhat too indiscriminately. Nor has the conduct of the negotiations been all that could be desired. We confess to a good deal of sympathy with the very small minority of operative plasterers who answered "No" to the question, "Do you approve the action of your executive committee in their conduct of the negotiations with the masters?" Mr. Deller's answers to the Secretary of the Master Builders were certainly not of the kind that turn away wrath. And yet we think the masters would have been well advised to have taken him at his word and accepted unconditionally the offer of a conference. If, as suggested, the offer was not seriously meant, the conference would, of course, have been ineffectual, but the public would then have been without the faintest shadow of a doubt as to which side was responsible for the present deadlock.

## THE ARCHITECTS' BENEVOLENT SOCIETY.

### ANNUAL GENERAL MEETING.

THE annual general meeting of the above Society was held on Wednesday last, when the annual report of the council was read. The president of the Society, Professor Aitchison, B.A., occupied the chair. The report stated that the past year had been a satisfactory one, and much useful work had been done. The sum of £654 14s. 10d. had been distributed amongst thirty-nine persons. The amount received in subscriptions was £471 10s., against £459 13s. in 1897. Nine additions had been made to the annual list of subscribers; but although there had been this increase in the subscriptions, there had been a considerable falling off in the amount received in donations, which was only £105 12s. as compared with over £300 in 1897. The Council thought that the steady increase in the number of subscribers indicated a growing interest in the work of the Society, and a wider recognition of its value in assisting unfortunate architects and their families. They considered, however, that the number of subscribers (a little over three hundred) was small compared with the number of practising architects who were in a position to contribute to the Society's funds. A sub-committee had been formed to consider the suggestion of having a festival dinner in 1900, which will be the fiftieth year of the Society's existence. The proposal carried at the Annual General Meeting last year to increase the number of the Society's pensioners from three to six, and the amount of the pensions from not less than £15 to not less than £20, had been confirmed at a subsequent general meeting specially convened on July 13th, and these pensions had been advertised and allotted to the most deserving candidates. They much regretted to have to record the death of three of the oldest members of the Society, viz., Prof. Hayter Lewis, Mr. J. J. Edmeston, and Mr. T. C. Hine. Prof. Hayter Lewis had bequeathed £100 to the society. He was one of its original members, had served on the Council, and acted as hon. treasurer from 1886 to 1889. Mr. Edmeston had also served on the Council from 1855 to 1870. Five members of the Council had retired, and the Council now consisted of Sir A. W. Blomfield, Col. R. W. Edis, Messrs. H. L. Florence, J. T. Christopher, S. Smirke, W. Grellier, E. W. Mountford, R. St. A. Roumieu, W. Woodward, E. B. l'Anson, E. H. Martineau, E. T. Hall, T. M. Rickman, and R. A. Briggs. The balance sheet and income account were read, and the Council expressed gratitude to the Royal Institute of British Architects for office accommodation.

Professor Aitchison moved an adoption of the report, Mr. Florence seconded, and it was carried unanimously. After this business was finished Mr. T. M. Rickman proposed a vote of thanks to the retiring members. He said they were personal friends of his, and their assistance while on the Council had been of great value to the institution. It gave him much pleasure to step into the shoes of one of them, and he would do his utmost to help on the work of the society. Mr. l'Anson seconded the proposal, which was heartily carried. Mr. Arthur Crow said that he believed he was the only retiring councillor present, and he thanked the meeting for their kind expression of the value of the work done by his colleagues and himself. Mr. Anderson remarked that the society had suffered very much from the loss of those who had rendered good service in the past, but it had been very fortunate, he thought, in securing the services of the gentlemen comprising the new portion of the Council. He proposed that the meeting should thank them. This proposal was seconded by Mr. Z. King, who said that he was pleased to see so many good men left who were willing to carry on the work. The proposition was carried with acclamation. Mr. Currey and Mr. Nash were re-elected Hon. Secretary and Hon. Treasurer

respectively; and the meeting thanked the auditors, Mr. C. Forster Hayward, F.S.A., and Mr. George Lethbridge, for their good services in the past. The Chairman proposed that Messrs. Dawson and King be elected as auditors to the Society, and his proposition was carried unanimously.

A vote of thanks, proposed by Mr. Nash, was heartily accorded to the Chairman, and Professor Aitchison, in reply, said that he was extremely obliged to them for their kind vote of thanks. He had the success of the society greatly at heart, and hoped that the object it was endeavouring to attain would be more widely known. He was sorry to notice the absence from the list of subscribers of the names of many in the profession who were doing very well. He felt sure that if the society was more largely known to the public, and the need for support pressed home on the successful men in the profession, it would not be so much

### Its Picturesque Cities and Monasteries.

#### VIII.—TOLEDO.

By F. HAMILTON JACKSON, R.B.A.

(Continued from page 55.)

OF the church towers, that of St. Tomé is the most notable, being the sole remaining portion of a mosque which stood here but was rebuilt at the beginning of the fourteenth century as a church by the Señor de Orgaz, whose descendants were counts of the same name, himself a descendant of Estéban Illan,

CALLE DE LA PLATA, TOLEDO. DRAWN BY F. HAMILTON JACKSON, R.B.A.

neglected. Their profession gave much to the country in which it flourished. It produced things to admire, and showed foreigners that we were a superior race. He was very glad to hear that next year they were to have a festival dinner, and wished it every success.

**The Advertisers' Exhibition** will be open at the Niagara Hall, Westminster, from April 22nd until May 6th next.

**A New Library for Putney** is being erected by Sir George Newnes, M.P., and Lord Russell of Killowen has promised to perform the opening ceremony.

**To Repair Bow Church, Stratford, E.**, the sum of £4700 is needed, according to Mr. C. E. Ashbee (Hon. Secretary of the Committee for the Repair of Bow Church) and Mr. A. M. Poynter (Secretary of the National Trust for Places of Historic Interest or Natural Beauty), who have written a letter to the "Times" on the subject. Of this amount £828 has been collected, and £417 17s. promised. £500 has been expended in the repair of the chancel, and work has been begun on the nave. It is pointed out that the balance in hand is insufficient to carry on the work, and, therefore, appeal is made for further funds.

the great Alcaide, who lived at the Casa de Mesa. It contains a picture by El Greco, considered to be his masterpiece, which professes to represent the burial of Gonzalez Ruiz, which was attended by St. Augustine and St. Stephen in this very church in 1312. The parish priest, Andrés Muñoz, who gave him 24,900 reals to paint it, appears in the foreground—a very determined man, for he compelled the town of Orgaz in 1564 to pay its dues of meat and wine, by action in the chancery of Valladolid. Close to this church is a building, which was the palace of the Count of Fuensalida, in which Charles the Fifth was lodged in 1537, and where his wife Isabel died. Another interesting place quite near is the space where the house of Juan de Padilla and his wife Maria—the leaders of the Comunero Insurrection—stood, which Charles the Fifth ordered to be razed to the ground in 1522. A granite column, with an inscription in honour of Padilla, now stands there.

About the beginning of the sixteenth century Toledo reached the acme of prosperity. Its population numbered 200,000 (now but 17,000 or 18,000) and it contained, besides the cathedral, twenty parish and six Mozarabic churches, nine chapels, fourteen convents, twenty-three nunneries, nine hospitals for

males and one for females. The King's court was unequalled in splendour save by that of the archbishop. The archbishops were a race of mitred kings, great alike in the arts of war and peace, and having the control of enormous wealth; even in 1700 the revenue amounted to 300,000 scudi. When the court was removed to Valladolid, the prosperity of Toledo began to decrease. In 1565 the decree declaring Madrid "Unica Corte" was its death blow.

The archbishop's palace is across the street from the Puerta de Mollete of the cloister, the doorway was made by order of Cardinal Tavera for his hospital of Afuera, but was appropriated by his successor. It contains a public library. The Zocodover is a Moorish market square, so called from "Zoko," "Thursday" in Arabic, the day on which cattle markets were held, and still continue to be held in Morocco. The Christians also held a market here which was exempted from taxes. It was for many years the site of the bull-fight and the auto-de-fé. It is a curious triangular sort of shape, with railings, within which are seats, and trees, which were planted in 840; it is not so picturesque as it once was, though an arched colonnade stretches along one side. Passing through one of these arches and down some steps one arrives at three interesting buildings. The most important of these, the Hospital of Santa Cruz, now the Infantry School, was founded in 1494 by Cardinal Mendoza. The building was finished in 1514, and is one of the first Renaissance buildings erected in Spain. The portal façade is very beautifully decorated with ornamental and figure carving, grouped about the door and windows, in which is one very curious feature, the columns of the architectural framing to the carving above the entrance archway curve round the outside of it in the manner of a hood mould! The two patios are exquisite, and the staircase is transitional between Gothic and Plateresque. Many of the columns are from the ruins of the

church of St. Leocadia. At the end of the street above Santa Cruz is the doorway of the palace of Pedro the Cruel, now a convent. The jambs are covered with arabesques and octofolds, containing the arms of Castile and Leon, a good deal perished from the scaling of the surface of the stone. On the other side is an inn called the "Meson de Cervantes," for Toledo disputes with Alcala the honour of having given birth to that great man. It is a typical Spanish inn, the sleeping rooms opening from a gallery on the first floor, while under the porticos men recline on chairs and read papers or eat their meals, and on the other side of the court yard are mules and country carts. Above the Zocodover is the Alcazar. It has been several times burnt, the last time in 1886, and is now a military college for officers. Three façades still remain, one of 1551, one of 1584, and one of the fifteenth century, the last a good deal altered. There is a celebrated staircase, very grandiose, with steps 50ft. long, made each of one block of stone, but more astonishing than admirable.

St. Juan de los Reyes is near the bridge of St. Martin, close to the spot where the magnificent palace of Cardinal Ximenes stood until the French invasion. It was a splendid Franciscan convent, and was built in 1476, by Ferdinand and Isabella, and dedicated to their tutelar apostle, in commemoration of the victory of Toro, where the King of Portugal was decisively defeated. Outside, on the walls, hang chains suspended as exvotos by captives delivered at the conquest of Granada. The interior consists of one nave of four bays, the westernmost of which has a deep groined gallery, beneath which was originally the principal entrance to the church. The transept is the most noteworthy part of the building. On the walls are enormous shields and heraldic bearings, which are said to be worked in stucco, and at the angles are tribunes pierced most elaborately with lace-like balustrading for the use of the Royal family. The most valuable of the rich decorations were destroyed by a fire at the time of the French invasion, when the monk's quarters were entirely ruined and the church turned into a stable. The cloisters were of the most beautiful workmanship and effect; like the church, of the most florid Gothic, with a profusion of figure sculpture. Of late years the Academy of San Fernando, of Madrid, has been restoring them with the most distressing result!

There are many other most interesting things to be seen in the city, such as the old ironwork, knockers, and bosses of doors, &c.,

which abound in Toledo, carved doors, such as that of the hospital by the door of the north transept of the cathedral, and doorways, such as that of the Posada de la Hermandad, once the hall of a brotherhood; but this article is already too long, and I will only refer before concluding to one or two things of interest just outside the city. Outside the Puerta Visagra is a planted promenade, at the end of which is the great Hospital de Afuera, dedicated to St. John Baptist by Cardinal Tavera in 1540. It has four patios or courtyards with the church in the centre, and covers a square of 300ft. on each side. In the transept stands the founder's mausoleum, the last work of Berruguete, in fact he died at the age of eighty-one before it was finished. It is well-composed and excellently carved, but perhaps a little overcharged with ornament. From this same gate starts the road to the celebrated Fabrica de Armas, which is about a mile away on the Vega. This manufacture dates from Roman times—it was continued by the Goths—the Moors introduced their Damascene system of tempering and ornamenting the weapons, and so early as 852

A COUNTRY TYPE. DRAWN BY F. H. JACKSON, R.B.A.

this identical fabrica was in full work under Abdur-r-rahman Ben Abhakem, though the present building only dates from 1788. The choicest Toledan blades are sometimes packed curled up like a watch spring.

There is a meadow near the station called to this day La Huertadel Rey, in which Alfonso held the Cortes demanded by the Cid (who was made first alcaide of this city among his other honours) before which he accused his vile sons-in-law, the Counts of Carrion, of their scandalous behaviour to their wives. There are some red brick ruins here which contain a few remnants of Moorish Architecture, supposed to have been the palace of a Moorish Infanta.

(To be continued.)

## MALMESBURY ABBEY.

AT the first meeting of the committee appointed to consider the proposed restoration of Malmesbury Abbey, held at the Town Hall, Chippenham, the draft statement for the consideration of the committee was presented, and, among other matters, contained the following:—"It was resolved, first, to undertake the restoration of the church as now used for a parish church; next, to make the ruined portions of the great abbey church safe from further decay; and lastly, if it should seem advisable and funds were forthcoming, to rebuild the three westward bays of the nave, which were almost entirely destroyed in the 16th century by the fall of the western tower. The present arrangement of the interior dates from 1822. Owing to the excellent character of the stonework, the church has been maintained for a long time in good repair, and little else has been done to the fabric beyond the renewal of the outer roofs. But the time has now come when something must be done to prevent impending mischief of a more serious character. The flying buttresses to the nave-vault have in places suffered much from long exposure to the weather, and several of these are in so dangerous a condition that it may be necessary to rebuild the arches. This will not, however, be done unless it is found impossible to repair them otherwise. As there are in all eleven flying buttresses, the cost of making them sound will be considerable; and if taken in hand one at a time a large sum will have to be expended in the necessary shoring, cradling, and scaffolding. The vaulting throughout the church fortunately seems to be in good condition. After the buttresses, the bases of all the walls will need repair, and the parapets must be made secure in places." Mr. Harold Brakespeare is the architect appointed to carry out the restoration of that portion of the Abbey required for use as a parish church.

A COUNTRY TYPE. DRAWN BY F. HAMILTON JACKSON.

## ENGLISH CHURCH ARCHITECTURE.

By H. A. PROTHERO, M.A., F.R.I.B.A.

(Continued from page 70.)

THE cathedral or great abbey type of church appeared in England suddenly and full grown, like Pallas out of the brain of Zeus. Putting aside the cathedrals before the Conquest, of which we know little, the first really great church in England was the first Abbey of Westminster, built by the Confessor, of which some parts still remain. It was a great Norman church of the usual type, with a long nave, aisles, transepts and choir, with apse and chapel, such as you may find abundantly in France, and more rarely in England. At the start our cathedrals and abbeys were virtually French in plan; not indeed entirely so, their proportion being different, and the double aisles never took root with us; but the plan of Canterbury, which was built by William of Sens, is a fair example of a quasi French plan by a great architect who built besides Canterbury a purely French cathedral in his own city.

### English and French Cathedrals.

Now, as I am speaking almost entirely about plans I propose to show you how rapidly and entirely the great cathedrals of England and France went apart in this respect. A French cathedral of normal type has double aisles, shallow transepts, and an apsidal choir surrounded with a corona of chapels. In some cases, as at Notre Dame at Paris, the aisles come out flush with the transepts, so that the cross shape, though visible enough to the eye is lost in the plan. The eastern chapels are also merely continuations of the aisles. At Bourges, one of the finest of French churches, there are no transepts at all; only lateral porches, but the chapels are a little accentuated. At Chartres, perhaps the noblest building in the world, there are transepts, projecting however but little from the line of aisles; and chapels fully developed for small services, round the apse. Now take the English Cathedrals and Abbeys. The present Abbey of Westminster has an almost purely French plan east of the crossing, the Nave only being rather English, with its great length and single aisles. But by way of contrast to our foreign neighbours I propose to go on to two typically English Cathedrals.

### Ely and Lincoln.

Ely as it stands is almost entirely rectangular; a simple long nave, transepts and choir, each with single aisles, and no chapels except as far as they could be formed out of the aisles. You will notice three things about it:—(1) The one little apse that remains belongs to the Norman period, and the form was abandoned by the later builders. (2) When a bigger chapel was wanted it had to be hitched on as an appendix; the general plan of the building not allowing of chapels round the choir. (3) Ely is our one attempt to adapt a central dome to pointed Architecture. It has never quite succeeded yet, and does not entirely succeed there. The Lincoln plan I put before you as that of the typical English Cathedral. It has, as you see, plain rectangular lines, single aisles throughout, and a very long choir with a second transept, leaving space at the east end for a big chapel, and the smaller ones are tacked on here and there when wanted. Just a word or two now on the

### Effect of Plan on Outline.

In skyline our Cathedrals are far finer than the French, and you can see at a glance why that is. Bourges, with no transepts can have no central tower, and the double aisles of other French churches have two faults, one is to dwarf the transepts, and the other to throw up the nave to such a great height that towers must be colossal to show at all. On the other hand the apsidal choirs, with their chapels, are far finer than our straight east ends, as you may see by comparing say Amiens with Ely, Lincoln, or Carlisle. Perhaps the surroundings of a cathedral are

hardly part of my subject, and I must not pause to compare the charming closes in England with their ancient gates and old-fashioned houses with the dusty "place" or ill-savoured bye-street, in which many great foreign churches stand; but I may point out in passing that with us cloisters are the rule and abroad they are the exception. As to

### Structures.

a cathedral or abbey church on a large scale is normally a four-storied building. 1. To begin with, there is generally a crypt under part or the whole of the church above. It may be asked, "What is the purpose or use of a crypt?" Well, if you come to think of it, a building of great size and weight must have something of the kind. As the walls have to be carried down a long way below the ground, a great deal of excavation is necessary in any case. That being so, there was no good in putting the earth back again, and the more sensible way was to make a subterranean chamber, which might serve occasionally for burials, but I suspect more generally for services in winter when the church above could not be kept bearably warm. The crypt of Chartres is used to this day for this purpose, the cathedral above being closed in severe weather. 2. The next story is of course that of the aisles and their arcade. 3. Above that the triforium. 4. And at the top the clerestory for light. As to the triforium, the same question about use might be asked; but the truth is that a triforium came naturally without regard to use, because, if you have sloping roofs to the aisles there must be a space between the nave arches and the clerestory. Then it followed as a matter of course to open the space thus formed towards the church and utilise it as a kind of gallery. Sometimes there are chapels in it, as at Gloucester. Perhaps in bad weather monks took their constitutional in it. One use it has been put to which is now memorable, for it was probably in the Triforium at Westminster Abbey that Caxton set up his printing press. There is one other class of church about which one may just say a word, and that is

### The College Chapel,

because the plan of it illustrates what I said about conformity to use. A college chapel needs no aisles and no nave. Accordingly a normal example has neither, only a choir and transepts forming an ante-chapel or vestibule. In Oxford they were very commonly back to back with the hall, and accordingly have no east window, the end wall being entirely occupied by a great reredos; a feature, by the way, which was not very usual in cathedrals, though there are some half-dozen about the country of which Winchester and St. Albans are the greatest examples.

### West Fronts.

Returning for a moment to a comparison between the cathedrals of England and France—and most of the finest are in one country or the other—two or three points of contrast will strike everyone who knows them well. Of the difference in general plan and skyline I have already spoken, as also of the great dissimilarity of their east ends. Now the west ends differed too in a very marked degree, though there may be a sort of general resemblance with doors and a pair of towers. The fact is, the French cathedral has its main entrances at the west end and at the transepts, while in England a lateral porch was generally preferred; this forms one of the most conspicuous features in our cathedrals, while foreign ones rarely have anything of the kind. The result is that French churches have magnificent west doors; sometimes, as at Amiens and Bourges, five great portals in a row. We have comparatively little to show in that way, and this fact reacts on the whole character of our west fronts, which are very usually quite the poorest and least effective part of the building. Of course, there are exceptions; Wells and Peterborough are magnificent, but they serve as well as any others to illustrate the relative insignificance of the doors. Of the fabrics I will say no more, and can only very briefly touch on the furniture. The splendid woodwork (which our churches have

retained through the storms of the sixteenth and seventeenth centuries much better on the whole than the French have) is mostly of the fifteenth century; and it is a strange thing that almost every little village church, whether in the agricultural counties of Devon, Somerset, or Norfolk and Suffolk, or among the fair hills and valleys of Wales, contained treasures of woodwork in the form of screens, stalls, pews or roof, carving such as we try in vain to reproduce. So lost was the art, that ignorant people staring at these gems of native workmanship concoct stories about their having come over from the Low Countries, or been fished up as trophies of the Armada! As if a fighting navy carried cargoes of church furniture—but there is no nonsense people won't talk. The real truth is that in the fifteenth century the art was universal, and these beautiful things must have been made by the village carpenter, and paid for by the Parish Guild.

### A Period of Decay.

In the sixteenth century it all came suddenly to an end. No more churches were built; no more glass was painted; no more wood was carved; great mansions arose in the new style of adapted Italian Renaissance; but the churches, stripped bare and whitewashed, entered on a long career of gradual decay. We may sum up their later history in a very few words. In the time of Elizabeth a very stately kind of *tomb* came into vogue. There was also a good deal of good Jacobean woodwork in the times of the Stuarts—pulpits, pews, panelling, galleries, and a few fine screens. Wren's churches, built mainly under Queen Anne, followed various plans—some being mere rooms handsomely fitted with woodwork and carving by Grinling Gibbons, some very beautifully planned with columns and a dome, the most perfect example being St. Stephen's, Walbrook. Of the Georgian period and the Gothic revival of our own day I have no time to speak.

### Use Determines Plan.

I have passed very rapidly over a very big subject, and will now only impress on you once more what I said at the beginning, that from start to finish *everything about the plan or structure of a church was dictated by the use to which the church was to be put*. A little church with a little congregation only wanted a nave and a little chancel; if more people wanted to come, aisles must be built for them. Small services entailed chapels; choral services produced larger chancels; the preaching friars required big naves where all could see the preacher, and their churches are in a way the parents of the galleried churches of the Georgian period, and of the typical Non-conformist places of worship, in which it is essential that the minister should be visible and audible to everyone in the building; a necessity which hardly exists (or at any rate exists to a very much smaller degree) in buildings where liturgical forms are in use. That is all I can say to-night. I hope you will bear with me if I have spoken mostly of the dry bones and anatomy of churches, rather than of the graces and beauties of Gothic Architecture—which nobody can love more than I do. For plain facts are, after all, worth knowing; and it is not until we know the recesses of its structure that we can really appreciate the beauties of a building.

**The Marble Plan of Rome.**—The destruction of the wall near the Palazzo Farnese is being continued, and eighty more pieces, large and small, of the ancient marble map of Rome have been discovered. The whole area of the marble map was about 500 square yards. It was constructed between the years 203 and 211 of the Christian era, and gave an exact idea of the form of the ancient city. Altogether, about one-third of the map has been recovered, or rather more than 120 square metres. As soon as the whole of the Farnese wall has been destroyed and all the fragments have been collected, an attempt will be made to reconstruct all that has been found of the map.

## COTTAGE HOMES AT MIDDLEWOOD, NEAR ROCHDALE.

By ESTHER WOOD AND G. LL. MORRIS.

FEW tasks could at first sight be less inspiring than to build homes for an ever-shifting population of citizens drawn from the roughest and least domesticated classes, vagrants to whom the words "home" and "school" are alike synonymous with "prison," and to whom such a phrase as "home life" means worse than nothing. The architect, even if his immediate clients, the "board" or "committee," proved fairly sympathetic, is apt to feel that he is building for an ignorant and indifferent mass of residents, none of whom will ever give a thought to his work and upon whom its æsthetic qualities are absolutely wasted.

Unfortunately this first-sight view of the question, this idea that "anything is good enough for a pauper institution," has produced a whole generation of hideous buildings which are still the eyesores of Marylebone, and it has only been partially shamed out of existence by the writings of Dickens and similar pioneers of poor-law reform. These, and the general humanitarian movement of the last half-century, have given us a higher conception of national charity, and we have begun to see that the outward character of our public buildings should be an index of the feeling of the whole people towards the object for which they are built.

When the evils of industrial schools began to be realised, the experiment of distributing

the children to live in working-class families—in other words, the boarding out system—was widely tried. This way, all things being equal, seems by far the best, the adoption of a child by a family securing at once the advantages of home life. Unfortunately in practice this system broke down; it was rare, indeed, that foster parents of a suitable character could be found, and friction was frequent between the children of the house and the stranger. It was also costly and difficult to exercise proper supervision over children in a home in which the prospect of regular maintenance money from the Union is probably the chief inducement for receiving them, and even if this system had been satisfactory, it only touched a minority, as guardians were only allowed to board out orphan children. Another system that has received much attention is that of scattered homes; this is the next nearest approach to home life, and reduces the official character to a minimum. The scheme generally is to build single homes here and there throughout a fairly wide district; the objections are: (1) A too great expenditure of labour by reason of being spread over such a large area, and (2) the supervision which is almost as difficult as in the "boarding-out system."

The next step was the building of cottages for the children to inhabit in groups, each with a responsible "house-mother," in addition to the girls' and boys' homes, there was the receiving ward, the school, chapel, and the hospital, all being brought under complete control; instead of a homely character it became institutional, with the drawbacks which attend charitable institutions, and too much officialism. The children were all clothed in a similar fashion, and kept safely

within the boundary walls, except during certain appointed hours, and generally the tendency was to regulate and order the lives of the children in a dull and uninteresting routine of duties, likely to drive out any sparks of individuality which they might possess. It is, however, beginning to be recognised that remedial measures of some kind must be adopted in place of these repressive ones, and more especially should this be so in regard to young lives; every effort in the way of giving to each child the groundwork as it were of his or her own life is a step towards the making of good citizens.

The experimental efforts made in this direction by the Sculcoates Union, at Hessle Road, Hull, by the Port of Hull Society at Newland, at Gateshead, and by several other bodies in the Kingdom, have had excellent results upon the health and intelligence of the children, and the Rochdale Guardians now have a similar scheme in hand. They have endeavoured to adopt a middle course in the laying out of their homes, and without altogether sacrificing the advantages of grouping the buildings together, have been able to impart a certain increase of homeliness, by a careful, but picturesque planning of the cottages upon the site (Fig 1). The children attend the local voluntary or board schools as if they were members of an ordinary family, and there is no distinctive dress or uniform to mark them off in an unpleasant way from their school-fellows.

The site is at Middlewood, about three miles from the town of Rochdale, and less than a quarter of an hour's walk from the village of Wardle on the one side, or of Shore on the other. It is surrounded by hills on three sides and approached by a road on the south which runs through the narrow valley at the west and east corners. Some nine or ten buildings, comprising pairs of cottages, superintendent's house, receiving house, workshops and stores, are being variously grouped in a pleasant and interesting way. The architects (Messrs. Butterworth and Duncan, of Rochdale) have aimed at making the little colony appear less like an institution than like a part of a pleasant village, the cottages being of irregular plan, and so arranged as to overlook a pretty glen, while their spacious setting gives all windows abundant light and air. The moral influence of country life has, probably, on sentimental grounds, been largely overrated; the wise guardian will rather depend upon the immediate surroundings and daily habits of a child, and the active interests afforded him, to do the larger educational work than that of school hours. It is here that the architect finds scope for enterprise. The homes must stand hard wear and constant traffic, the stairs and entrances must not be dangerous to young and careless children, nor the mats, fenders, &c., and other furniture, easily tumbled over or upset. At the same time each house should be beautiful enough to give the children a pleasure in their home and an interest in keeping it orderly and clean. The architect must remember that he is building for growing girls and schoolboys, not for the passive life of almshouses and harbours of refuge for the infirm. The whole aspect of the place should be such as to give an incentive to careful use; neither so soiled as to involve continual labour—especially as the children will be expected to do a good deal of the housework themselves—nor on the other hand so bare and glazy that no trouble need be taken. In the appointments of the dwelling the children should be able to learn something of the natural properties of materials, the beauty of the grain in wood, and of smooth or polished metal.

In the designing of this educational colony at Rochdale provision for direct teaching is made by a substantial two-floor building devoted to workshops, separate from the cottages, and including a well-appointed carpenters' room, a smiths' and plumbers' room, another for tailors, and another for shoemakers, each with cutting-room and store attached. The technical side of the education is, therefore well looked after; at least, in the boy's case. It would have been pleasing to see some equal provision made for the manual training

## COLOUR.

BY HUBERT C. CORLETTE, A.R.I.B.A.

AT the fortnightly meeting of the discussion section of the Architectural Association, Mr. W. B. Hopkins presided in the absence of Mr. H. J. Leaning, D.S.I. Mr. H. C. Corlette read a paper on "Colour," of which the following is an abstract:—

There are three questions with which we are confronted when we wish, as architects, to have colour associated with the buildings we design. The first of these requires an answer which shall tell us how we shall satisfy this desire. The next asks where we may legitimately introduce what we desire to employ. But, perhaps the most difficult of all is to decide upon the method of treatment by which the decoration shall be done. This last involves many things, which everyone must settle for himself. It asks what are the methods to follow, what the media to be employed, how decoration shall be introduced, the nature of drawing and design, and the qualities of colour that should be adopted for effects we wish to see. These are the points a lover of colour must consider if he wishes to do good. His aim should never be to seek applause, but to do his best with the faculties he possesses.

### Structural and Applied Colour.

In asking ourselves how we shall introduce colour in works of architecture, we must consider whether it shall be done by using coloured materials, or by applying such materials as will introduce the necessary colour. The two methods combined are really necessary for a completely satisfactory result. Of coloured materials used structurally there are many examples to be found in many parts

of England. We can see how stone and flints have so been used for this purpose in the Parish Church at Worsted and the old Guildhall at King's Lynn. Essex gives us instances where brick, stone, and flint are associated on one building with very beautiful results. There is no reason why white brick should not be used, as it is sound and lasting, and possesses a "good ring;" also it is cheap, but not necessarily nasty. The yellow or dun-coloured stock brick is also a good colour, if used well, and with some of those silver-grey bricks introduced into a wall of it excellent effects may be obtained. Tiles for roofing are too often red, but there is no reason why we should not resort to white ones sometimes, and we should do well to decline to use so frequently the half shining, dead-surfaced purple-red ones. In the past it was frequently the custom to use local materials to satisfy local needs. This practice has not been altogether discarded, but it might with profit be carried out more often. Although Sir Walter Scott writes of the grey walls of Kenilworth, they are red, because stone of that colour was found in the district. As architects we must devote more attention to the subject of structural colour, for it is in this province we depend upon our own resources. Byzantine and Italian provide us with examples of what was done in the past, but to be more recent, we can see how thoughtful and effective instances can be found in London by studying the north and east fronts of the Law Courts. On this red brick and a grey and white stone have been used. Terracotta can be used in conjunction with brick of a beautiful red with good results, as can be seen in the Exhibition Road, in front of the South Kensington Museum. Age and situation, of course, do much to improve materials which originally have been glaring and self-assertive.

### External and Internal Use of Colour.

Throughout centuries colour has been applied as a means of decoration in ways so numerous that to mention them would mean the compilation of a prosaic catalogue. It was thought at one time that no work of architecture was complete if it was not in some way treated with colour. We all know that the Egyptians used colour on everything to which it could be applied; but they were favoured, like all southern artists, by conditions of climate which allowed freedom of design within certain limits. The Greeks improved on the methods of the Egyptians and coloured the designs in relief of those which were cut back from the surface as incised work, leaving much of the native grey or red of the building to play its part as a ground for the whole of the more brilliant decorations provided by the details. We may, then, use colour either structurally or by application to a material not possessing sufficient colour of its own. When we take up internal decoration we have nothing to fear from climatical conditions,

(To be continued.)

**Denny Cottage Hospital** was opened on Tuesday, last week, by Lieut.-Col. Logan. Its erection has cost £900.

**Phillipsville Estate, Middlesbrough**, owned by Councillor Theo. Phillips, is to be laid out and offered in villa sites. The plans for this work have been prepared by Mr. A. F. Newsome, F.S.A., architect and surveyor, Albert-road, Middlesbrough, and show the estate laid out for some 200 detached and semi-detached villa residences.

**West Stafford Church** has just been re-opened after restoration and enlargement. Mr. C. E. Ponting, the diocesan architect, has had charge of the work, which has been carried out by Mr. Hoskings, builder, of Hungerford. The enlargement has been effected by extending the nave eastward. In the chancel a new altar tomb, and stained glass window to the late vicar—Canon Reginald Smith, of whom the extension is a memorial—have been placed. The tomb is the work of Messrs. Harry Hems and Sons, of Exeter, and the window is by Messrs. Burlison and Grylls, of London.

and it is here we find opportunities for our faculties for providing the necessary field for those who possess the capacity to satisfy our aspirations.

### Grounds.

The grounds upon which we may begin our operations call for consideration under two heads. First, the material and texture of the ground, and its capacities for producing, sustaining, and showing colour; and then the colour and method of treating the ground upon which the work is to be done. I will not discuss these points in detail, but will merely recall to your minds some materials which are ordinarily the ground upon which we may ask colourists to provide us with design. The staple material in Egypt was apparently granite, but they also used brick with diversely glazed surfaces. Burnt clay has always been found an excellent foundation for colour. The ordinary red brick with very little preparation was used in the case of a large painting in Albi Cathedral in the South of France. This work was executed in the fifteenth century, and was done directly on the brick surface of the great circular tower piers within the nave. It has stood all these centuries without decay, and the brick pointing lines, which are clearly visible, are a help to the texture and general effect of the whole scheme. Plaster, prepared for fresco methods, tempera, or oil, has been found very good material. A thin coat of plaster over brick or stone was a favourite ground in the middle and later ages for both tempera and oil. Another point to be considered in regard to all grounds is that of the colours they shall take as a foundation on which the designs are to be worked out. We must consider here the scale and tones of all other colour associated with the ground. The Byzantine mosaicists favoured very much a gold ground. At Albi there is one of the finest decorated vaults I have seen, with a beautiful, deep grey-blue ground, upon which a great deal of white has been used in the conventional patterns covering it. Heraldic colour is of great value in a scheme of decoration.

### Drawing, Design, and Colour.

These obviously depend upon the colour of the ground we have to work upon. If it happens to be white we have more liberty of choice than when we have to deal with a coloured surface. Each decorator will best decide for himself what nature of drawing is best adapted to certain situations, but those parts distant from the eye of a spectator require different dealing from those nearer to him. Good results can be obtained by a good use of simple line and broad uncomplex treatment. A designer must be permitted to interpret his ideas in his own nature and characteristic manner, for if he is fettered by fixed conditions in his work it is likely to become spiritless. In regard to colour, it is essential that this should be simple, conventional and flat; that is, without modelling or shading. It need not necessarily be a dead colour, but it must be broad and quiet in feeling. This result can be obtained by limiting ourselves to the use of a very restricted palette of three or four colours. To figure work the same principals may be applied, unless it is close to the floor. The choice of colour is an important matter, and fortunate results can be obtained by selecting primaries to play the most important part in the whole harmony, with the assistance of white and black. One primary with its complementary secondary, or two primaries and a uniting secondary, helped with white or black, should be sufficient to produce beautiful combinations. We need true, pure, and beautiful colour in decorative design, such as Burne-Jones and Morris helped to give us at the time of the so-called Renaissance of the fifteenth century. It should not be overlooked that, however we may decide to work, it is necessary to keep colours which are juxtaposed all in a related key of harmony.

### Source of Ideas.

But where are we to find ideas for all our schemes of decoration? Certainly not by

copying or adapting what others have done, or by trying to revive what some are pleased to call the "Styles of the past." There is only one source of inspiration open to us, and that is to be found in all the works of created nature. Subjects may be derived from Divine action among men, from secular and ecclesiastical history, and from myth, fable, and tradition, if we will. But the proper interpretation of these depends upon our knowledge of, and capacity to tell, what we have learnt from what we see and understand in nature.

### Realism and Conventionality.

Whether this can be best managed by realistic representations of any subject, or conventional interpretation of a set of objects, will be decided by a consideration of those principles I have endeavoured to justify. Realism in clever hands may almost become deception, which we must avoid, as that conventionality, based upon ignorance and bad taste, becomes distortion. Generally, decorative work should interpret by a conventional use of the suggestions to be found in natural forms, while it is to pictorial design in colour that we must leave the representation of forms as they are.

### Methods and Media.

There is a kind of mosaic which I have seen, so far, only once used, and it then suggested to me that we might well take up the method with advantage. The instance was on the side wall of a plastered outhouse in a remote village in Norfolk. The material in the setting sun looked very beautiful, and I was surprised to find on coming nearer that the effect was produced by bits of old pottery, broken china, and glass of various colours. The use of glass, stained or clear, and mosaic, as a method of adding colour to Architecture, is one of most beautiful and reliable media with which a colourist can deal. With regard to glass, it should always be recognised that it is but a part of one united scheme in which the due relations of scale, whether of size, treatment, or colour, must be maintained.

### Architect and Craftsman.

The architect should always, in my opinion, invite the craftsman who works with him to try and enter into the spirit of his own work, and though such a man may be an interpreter, he should be allowed also the privilege of exercising his mind as helping inventor. There must be subordination to the leading oversight of the guiding one, but subjection is not and never should be interpreted to mean slavery. As in any constitution for larger purposes there must be rule from a centre, if the action of law and government is to carry a purpose into effect, so it is in the things of Art. A head of a State should not be too proud to seek the opinion and counsel of those who are qualified to be his advisers in special matters, and, though it is his duty to rule, it is also his privilege to confer with those he is bound to guide.

### Individuality and Compromise.

By this means every individual is led to realise his position as but one of a body with a common aim, and if he feels this he is enabled to do his part towards expressing some definite ideal. We are all at times called upon to subject our own individuality, and it is well if by this compromise we may the better act for the benefit of all.

### Features of the Discussion.

When the paper had been read the chairman called upon Mr. Smith to open the discussion, and his opinions were followed by others, from Messrs. C. H. Strange, Cole A. Adams, A. L. Shuffrey, Hine, and W. B. Hopkins. Mr. Smith expressed for the meeting the thanks they felt were due to Mr. Corlette for the paper he had read, and also for the numerous coloured pictures he had brought to illustrate his remarks.—Mr. Hopkins seconded the proposal.—Mr. Smith then went on to say that he thought the materials used nowadays were very bad. He thought that white, red bricks, and tiles might be made to vary a little. The red brick used by the speculative builder, he said, was unequalled for nakedness. He

thought experiments in trying various mixtures of clay would be of use. He cited an instance of the effect of the sun on patterns made by broken green glass bottles. He said Prof. Aitchison, R.A., in a paper on Greek Art, insisted very strongly that the Greeks used primary colours, and red seems to have been largely used, and to have been primary to a strong degree. He agreed that the architect and craftsman should be more in unison. He thought mosaic work should be plain.—Mr. Weymouth said that he thought the public were beginning to appreciate the use of variety of coloured materials.—Mr. Adams had noticed that white bricks discoloured in time. He thought that with regard to tiles, the less said the better. He was of the opinion that good effects could be attained in the disposition of slates. With regard to stained glass, if there was colouring in the interior of the building one ought to be careful that the two methods did not clash.—Mr. A. L. Shuffrey referred to the anxiety of young architects to put all the knowledge they had into effect on their first building. With regard to glazed materials he was not in favour of them at all. Materials, in his opinion, should be so selected that the hand of time had a mellowing and improving effect on them. He did not think the soot and dirt of London hurt red brick. If, he said, we studied nature at home instead of going abroad, there would be less likelihood of going wrong. He did not agree that primary colours should be used in large masses; secondary colours, he said, were of more use for larger surfaces. With regard to magenta it was, to him, not unpleasing when used in such a way that one forgot it was magenta.—Mr. Hind in the course of his remarks supported Mr. Corlette's views. Mr. Corlette briefly replied to the foregoing remarks on the grounds he had taken up in his paper.

**The Proposed Restoration of Quarnford Church,** near Buxton, will cost from about £1500 to £2000.

### Condition of the Engineering Trades.

—According to the report of 1898 of the general secretary of the Steam Engine Makers' Society, there has been a rapid recovery from the effects of the engineering trades' lock-out, which lasted six months in 1897. The return for the month of May, 1897, showed 335 members on out-of-work donations, and in May, 1898, the number had got down to 83, which has been about the average up to the present time. The secretary states that this has not been surpassed in any previous year.

**A Claim for Work Done.**—Before his honour Judge Martineau last week, Asher Collins and Alfred Piper sued John Vinal for £24 balance for work done.—Mr. Prince, for the plaintiffs, said that they were working builders, and did the bricklaying work at some houses at Seaford for the defendant, and the question was whether plaintiffs were to be paid £28 or £25 per house.—The plaintiff Collins was called, and said the agreement made with the defendant was that they should do the bricklaying and slating work at nine cottages for £28 a cottage.—T. Morling, Clinton Place, Seaford, said defendant's foreman gave him to understand that the price was £28. That was a fair and honest price, and the work could not have been done at a profit for £25.—Mr. Dawson, for the defendant, called the latter's manager, who said the arrangement with the plaintiffs was that they should try to do two of the cottages first at £25. When they had finished them plaintiffs asked if they could go on with the others, and were told that they could, nothing further being said about the price. The defendant was also called, and said he did not authorise his manager to go to £28 a house, but in cross-examination he admitted having paid plaintiffs £27 a house for similar work at Newhaven, and denied that they had a great deal more work to do at Seaford.—His Honour said his own impression was that the price for the first two houses was to be £25, and that nothing was afterwards said about the price for the others. There would therefore be judgment for defendant.

## PUBLIC BATHS.\*

BY A. SAXON SNELL, F.R.I.B.A.

(Continued from page 75.)

I HAVE had two long and interesting letters from a Superintendent of Baths in a Midland city. I shall have occasion to refer later on to one or two points he brought to my notice. But among other matters he described the soap bath of his establishment. He says in his first letter: "I like the increasing favour shown for the former [shower] kind of bath, and should be especially pleased to see it supersede our present arrangement of a soap bath, as well as the slipper, as that can scarcely be considered a proper system which only allows one change of water for as many as forty persons for each change (I am referring here to the soap bath). The same bath-room fitted with automatic feeding showers, having a regulated warm temperature, also a separate corner for a cold shower, would hardly use any more water, and even if all the dozen I have seen in at once, were under the showers, they would each at least have clean water." Later on, in answer to my request for

## The Dimensions,

he says:—"The dimensions are 8ft. by 5ft. by 18in. depth—usual depth of water 12in., therefore equal to about 240 gallons. A serious drawback, which I did not like to mention in my last, is the fact that there is no shower with it, so you may imagine the bathers plunging into the bath to clean themselves of the soapy water, especially after some dozen or so of moulders, mechanics, &c., have washed themselves." He adds: "I am forced to believe that the soap bath is also a serious competitor of the slipper on account of the cheap prices of the swimming." Apparently the canny mechanics of the city think a twopenny swim, with the preliminary wash in this delectable soap bath thrown in, very good value for money. But fancy that soap bath after the third man has washed!

## The Soap Bath

is not necessary only for lower-class people. In warm weather, people who do not indulge in a daily bath (and even some who do) are unable to keep their body—and especially feet—in just that state of absolute cleanliness in which—in deference to their fellow bathers—they would wish to be before entering the common bath. Then, too, a cold douche is invigorating after the comparatively warm temperature of the bath. With respect to swimming baths, I have only to add that they should be lighted by a large lantern with side-lights to open in the roof, and the walls should be lined with impervious material, glazed tiles or bricks for preference. A bath cannot be too well-lighted. For ventilation—and a bath wants plenty of it—it is desirable to have an electrically-driven fan. I should add, by the way, that these fans give a lot of trouble, because they are so soon affected by the dampness. Perhaps some form of water-driven fan will yet be devised.

## Warm Baths.

We have next to consider the warm baths, provided only for washing purposes. The present form is almost invariably the ordinary slipper bath as it is called; but—to be prophetic again—I think the days of its general use are numbered. Some of them will always be required, and it is worth while to describe them. The best form is, of course, the porcelain enamelled bath glazed inside and out, and sometimes with a glazed rolled edge. Personally, I always use those glazed inside only, and with a wood top (teak for preference), because I think the greatly increased cost of outside glazing never worth the better appearance; and a roll edge, although cleanly, is uncomfortable, and may be dangerous. It also adds even more to cost. The usual length is 5ft. 6in. to 5ft. 7in. from out to out. These baths are usually enclosed in front, for reasons which have never quite convinced me, and I

am now omitting the casings. Each bath is fitted up in a very small room, which has an area of 36ft., but better 40ft., or as much larger as can be afforded. The walls are generally built up of slate slabs, 6ft. 6in. to 7ft. high, sometimes left plain, but more often highly finished in enamelling. Marble is also employed, but I do not recommend it, and for this reason, it is so necessary to keep these places absolutely clean that any surface which will hide even the appearance of dirt is to be avoided. Inversely, they should not only be clean, but look it, to inspire confidence. It is impossible to see at a glance whether marble is or is not perfectly clean. Various other forms of partition wall are employed, and notably a thin brick wall, glazed both sides.

## I Prefer the Slate,

because with its use no woodwork at all is necessary, even as door-posts. Each bath should be fitted with hot and cold water taps, fixed on to the front partition with the valve spindles taken through, so that the attendant outside can turn the water on or off. In the same way the waste valve should be operated by the attendant from the outside, but it is desirable to have the means of doing so also from the inside of the room. The floors of these compartments should, of course, be impervious to wet—tiles or mosaic if we can afford it, granolithic for economy. A disagreeable experience has taught me that these floors should be laid to fall. Bathers sometimes splash the water over the sides, and the baths also overflow at times. Mr. Hessel Tiltman dwelt at some length upon the

## Shower or Rain Douche, Baths,

which are in use in many Continental towns; and advocated their adoption in this country. At the time, I mentioned that some form of it had been successfully inaugurated by a northern manufacturer for his workmen several years ago. I have since refreshed my memory, and will refer any one who is interested in the details to a paper read before the Sanitary Institute Congress in 1888, at Worcester, by Mr. Charles Clement Walker, F.R.A.S. The main idea of these baths is that the bather shall not be compelled to bathe in water which has already been fouled by what we may describe as the first washing of his body, but that every drop of water, as it becomes soiled, should be carried away at once. This idea was

## Adopted over Twenty Years ago

by Mr. H. Saxon Snell for lavatories in a poor-law industrial school. It has been improved and modified since in many ways, but the principle remains the same. Another advantage of such baths is that they could be erected at about half the cost of the ordinary slipper bath, and it would be possible, therefore, to make a lower charge for their use, a matter of very considerable importance in the great work of reducing the numbers of that class which is facetiously dubbed the "Great Unwashed." It is, however, very hard to wean the public from old-established customs, however salutary the innovation proposed. It is a good beginning to provide a hot and cold shower to the slipper baths, and in time, no doubt, we shall discard the bath itself. I say we, because I think most of us have a sneaking regard for the comfortable warmth of a casing 4in. thick of warm water for a few moments, and some of us love

## The Shower

—the cold shower—more in theory than in practice. Before leaving the subject, it is well to note the necessity of light and ventilation and plenty of both in the room. The amount of vapour alone given off from the baths will soon make everything clammy and the atmosphere foggy unless it can be quickly removed. A lantern with opening side lights is generally sufficient. I do not propose to deal with medicated, sitz, vapour, and other special baths, beyond noting that one or two may be included with advantage. Turkish baths in a public institution are as yet exceptional, but, no doubt, when their hygienic properties are more widely known, and, I may add, when they can be indulged in more cheaply, no public baths

will be complete without them. By the way, why should it be considered necessary to adopt exclusively eastern forms and decoration in Turkish baths? They are none too soul-inspiring, and are certainly not "at home." Personally, I propose to break through the tradition in the Stratford Baths, and try the effect of the latest new humour in design. A fair-sized waiting-room, which should be comfortably furnished, is necessary to each set of baths, for there is much waiting to be endured at certain times in all establishments. Water-closets, in the proportion of, say, one to fifteen baths, should be provided, and they should have direct and

## Separate Light and Ventilation.

The Committee requested me to read a paper on "Public Baths," and I have assumed that the omission of "washhouses," which are almost invariably associated with the subject, was intentional; and I felt profoundly thankful, because the subject of washhouses is a fairly large one in itself, and could not be adequately dealt with as part of another. Every set of public baths must, however, have a small, completely-fitted laundry as part of the establishment. This is required entirely for washing the hundreds—may be thousands—of towels and bathing-dresses used by the bathers. Towels, as they are used, are thrown by the bathing attendants into receptacles which are periodically emptied and taken to the laundry, washed, and returned to the store or the pay office. It follows, then, that there should be

## Easy means of Communication

between the departments, and this is best achieved by subways. If it is possible to have a shoot from each department in these subways a basket or trolley can be placed under to receive the dirty towels, and some labour is saved thereby. With respect to the laundry-room itself, it is only necessary to say that the floor should be paved to falls, the walls should be faced, at least 6ft. or 7ft. high, with white glazed bricks, and there should be ample light and ventilation, mostly from the roof. The machinery should include the usual rotary washing machines, centrifugal wringers, steeping and rinsing tanks, and a few washtubs.

## Steam-heated Drying Horses

are also required, and if there is not room for a fair number (and they take a disproportionate space) a cylindrical steam-drying and ironing-machine will do a very large amount of work for the space it occupies. As the machinery must be power-driven, it is always desirable to have the laundry not too far from the engine room; but it will be found desirable to keep the two departments quite separate, if women are employed in the laundry

## Engine Room and Boiler House.

The engine-room and boiler-house should, in my opinion, be quite show-places in their way. Until quite late years, these vital parts of the establishment have generally been consigned to odd corners or dark basements; in fact, anywhere where the ingenuity of the engineer can possibly fit up his boilers, &c. Only two or three years ago I went over a building, but just then erected, which comprised public baths, a gymnasium, free library, and technical institute, in which the necessity of a boiler and engine-house had apparently been forgotten; indeed, I believe actually so. So the boilers were put in the subway, under part of the swimming-bath hall, and the engines and electrical plant were arranged in a line along the narrower part of the same subway. The towel laundry was 7ft. 6in. high, with no light but what could be obtained from little areas, and the communication between it and the engine-room was a doorway, 2ft. wide and 4ft. high. It couldn't be bigger without cutting too much out of a bath wall-piers. In the smallest institutions at least two steam boilers are required, and if three can be afforded, all the better; because with three boilers it is possible to use one for the direct supply of hot water. The engine-room must of course be closed off from the boiler house and room will be required for an engine, boiler, feed pumps, lathe, and other tools.

\* A paper read before the Architectural Association on March 3rd, 1899.

I have said that the engine-room and boiler-house are, or should be, show places, and perhaps, in saying so I am assuming in my professional brethren something of the keen pleasure I always personally feel in the contemplation of machinery and engineering work generally. Perhaps I may be permitted to add that I have always felt that we should none of us be worse architects for understanding a little of the subject. Short of this I do not see any better way of ensuring that advance in building so desirable to keep pace with the marvellous development of engineering than a closer alliance with those who have made engineering their study and practice. Professional exclusiveness and jealousy may yet die down sufficiently for this. Already the majority of architects consult the other profession very largely; but not as much I think, as they will in future. I have not much necessity to do so myself, because it is part of the tradition of my office to lay down the engineering schemes in all their details in all buildings. Yet that very fact has taught me how much this matter affects, or should affect, the design and details of a building. The profession of an architect calls for so wide and varied a knowledge of ever-increasing details that purely engineering work would appear

#### A Serious Addition to our Labours;

but certainly the knowledge of so much as applies to the purposes of our own buildings is most desirable. Short of this, it is absolutely essential to acquire so much as will enable us to associate ourselves appreciatively with the professional engineer whom we consult. I may add, by the way, that it would be to the advantage of the building work carried out by engineers (public bridges, for instance) if they would consult an architect—and a good one—and take his advice with respect to the architectural “trimmings.” Probably the architect would say, “Don’t have any;” but the work as a whole would not suffer. Adjoining the boiler-house should be a large coal store, and, within bounds, the larger the better. It should have direct communication with the boiler-house and the public street.

#### Administration.

We arrive now at the administration of the buildings. The superintendent’s apartments should be designed like any other private house, and it should have separate access to the public street. Six, or at most eight, rooms are all that are necessary, and, as I mentioned before, they should be comfortable and as roomy as can be afforded. A board or committee room is necessary, and our clients will never complain if we lavish a little architectural display therein—and small blame to them. Unpaid public work deserves comfortable and, indeed, elegant surroundings. A superintendent’s store for towels, soap, and other necessities is essential. It should scarcely have less area than 150ft., and may be nearly twice that size with advantage. If either of the baths are to be used at times for a gymnasium or for

#### Public Entertainments

we can scarcely have too much rough storage room, which may be in basement or even subways. Without going into many other details, which would occupy the rest of the evening to deal with exhaustively, I think it well to mention briefly the important matter of drainage, because there are special conditions to be met in public baths. In the first place the swimming bath drains should not be connected to the general system, and if possible each bath should drain direct into the public sewer, with the usual disconnecting trap, &c., of course. If they are connected to the general system the enormous pressure and bulk of the bath water will quickly choke back the flow from any other part of the building, if it does not even find its way up the pipe into the lower parts. A large sluice-valve is necessary close to the bath outlet. It is important, too, to bear in mind that the outlet should be covered with a close grating. Some few years since, in letting off a certain amount of water to lower its level in a swimming bath, a boy was drawn by the strong suction right into the

outlet pipe, and of course drowned. The warm baths may be taken direct into an ordinary drain, provided the latter discharges over an open trap. The end of the drain-pipe should be continued up in iron as a ventilator. A further precaution against foul air entering the room is to trap each bath. The Midland superintendent I referred to writes me that at his establishment the

#### Wastes are Carried Untrapped

through the floor into a subway to discharge over a channel in the floor of this subway, which leads the water off to a trap; but, he adds, that in this case the channel is too shallow, and so the bath-water is practically discharged on to the subway floor with unpleasant results. I mention the matter as an instance of the want of that care and forethought which are so essential in dealing with the subject. It is not a bad idea to discharge over such a channel if it is only deep enough, and can be regularly cleaned with a hose. Finally, every part of the drainage should be easily accessible, for delay in removing a stoppage might seriously disorganise the work of the establishment.

#### The Discussion.

The Chairman, Mr. G. H. Fellows Prynn, in proposing a vote of thanks to Mr. Snell, said the Germans and Austrians were before us, in many respects, in their public baths and washing arrangements, especially so in the douche system, which was in many respects better than the slipper system. With regard to the transept system of obtaining a large number of boxes round a bath, it had occurred to him that a series of a sort of semi-circular transepts could be arranged round the sides, with a douche in the centre of the semi-circle, thus obtaining quite double the number of boxes. The bather could then readily take the douche on leaving the box, and afterwards plunge into the bath, and the boxes would be at the same time under complete supervision. He thought there was no harm in getting the engineer to carry out purely engineering work in a building, and he thought the more confidence architects placed in engineers, the more confidence would they experience in return. Mr. T. N. Dinwiddy seconded the vote of thanks, and said that in planning baths the difficulty of getting women to wash was sometimes overlooked, and too many slipper baths for women were provided, as they used baths far less in proportion than men. The water supply was, of course, great, and it was found cheaper to use well water than a company’s supply, and in this case it would, of course, be necessary to provide a storage tank.—Mr. E. Harding Payne said that cross ventilated lobbies between lavatories and public baths were frequently neglected. On a warm day the smell from such places travelled to the surface of the water and hung there, and was most obnoxious to swimmers. In nearly all large baths galleries were provided for the purposes of entertainment, and were practically useless, as usually only the first row could see the water. He did not think it was necessary, as a rule, to have a club room in connection with a second-class bath. He thought subways were not used as much as they might be. There might be shootes to trolleys for sending the towels to the laundry. He suggested that galleries could be provided at slightly extra cost and extended site, by providing them in the form of an amphitheatre, with boxes above the tiers, and underneath, at the back, a passage way could be provided from one end to another of the bath, as in many cases there was no means of performers in tournaments getting from one end to another except along the front.—Mr. C. H. Brodie said he did not see why subways could not be used for getting from one end to another of the bath. He thought rubber might be used for the platform round a bath. Mr. H. F. Clark asked the cost of a public swimming bath per cubic foot.—Mr. Ernest Herbert said that in a small public bath in Edinburgh the entrance passage extended all the way round the back of the boxes and, consequently, as the bathers left their boots in their boxes, dirt was not carried on to the platform round the bath.

That arrangement did away with some of the platform on the side of the bath, and, where a gallery was not required above, it gave room for the slipper baths on the first floor round the sides of the bath. There was, however, a waste of space on the ground floor. He thought rubber round a bath would be unsuitable. Slate was all right if it was slightly roughed on the surface.—Mr. O. L. Marchant, Superintendent of the Marylebone Baths, said it was difficult to prevent dirt being carried into a bath by the feet. The remedy was to see that the attendants kept the place clean. He thought that as so many swimming baths were being provided in nearly every parish of London the great swimming baths would become unnecessary, and baths of about 100ft. by 35ft. would be found quite sufficient. Mr. F. Peck said that concrete was not sufficient to keep the water in, asphalt must be used as well. He thought that when an architect consulted an engineer he should be really an engineer, no member of a trade firm. Mr. E. J. Wakeling, Chairman of the committee of Shoreditch Baths thought the ideal size of a bath was 100ft. by 40ft. Mr. Matt Garbutt said that he once saw the danger of accidents due to the slippery edge to a bath obviated in a German one by a railing running all round, with frequent spaces.—The Chairman then put the vote of thanks, which was carried with acclamation.—Mr. A. Saxon Snell, in replying, said that he thought Mr. Prynn’s idea of circular transepts was a very good one, and would give a fine effect, with the shower-bath in centre, but of course the site would have to be unrestricted. He thought it a good suggestion to have the curb of a swimming bath slightly roughed. He had used both Portland stone and marble, but Portland stone wore quickly and got green in spite of cleaning. Marble was not so good as slate. The material he had referred to in his paper was glass mosaic; the surface of which being rough, he imagined would give a good foothold. If cross-ventilated lobbies were heated above the temperature of the bath hall, the air would not enter it. A club-room was useful to provide in a second-class bath as it could be used for parties of school children. He thought a modern set of baths could not be built for less than a shilling per foot cubic. He did not use asphalt linings for baths, but when used he recommended two thicknesses. A good way was to build a bath as a gas-holder tank might, trowelling the cement very smooth, and having puddled wall behind. He did not think a railing good, as it was desirable to have free access to the water all round.

**A Wrought-iron Gate,** the gift of the Vicar, the Rev. D. Methven, has been erected in the chancel of the Parish Church of Earls Colne.

**A Boys’ Institute for Southwark.**—A new building in connection with the Fegan Institute has just been opened in Southwark Street, London. It consists of three floors, the rooms being devoted to purposes of study and recreation.

**The New Wesleyan Church and schools** in Blackhorse Road, Walthamstow, were formally opened last Wednesday afternoon. The buildings are in red brick with white facings. The schools are under the chapel. The cost has been £4796.

**Excavations in Tunis.**—The excavations now going on in the Theatre of Dugga, in Tunis, show (says the “Morning Post”) that the Romans possessed for their theatres a system of stage carpentry equal, if not superior, to the appliances now in use. An ingenious contrivance enabled those who stood underneath the stage to see what was proceeding above. A number of trapdoors opened in the centre of the stage, and grooves have been discovered showing the way in which scenery and stage furniture were lowered and raised. Eight large holes led to several dry wells three yards deep under the stage, while a large receptacle served to store the curtain in during the performance. The floor of the stage was covered with mosaics.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### SCIENCE AND ART EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly tell me, through your columns, if it would be possible for Candidates for the examination in "Building Construction" to enter for the same in any other way than by attending the examination held at the Science and Art Department at South Kensington.—Yours truly,

"ENQUIRER."

Candidates may attend the examination at any science school by paying a small fee and giving sufficient notice.

### BOOKS ON STEEL AND IRON WORK.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Will you kindly inform me in the enquiry column whether there is a recent and reliable text book on constructional steel and iron work. I mean by recent, one that has been published since steel has been used so largely in the construction of all large buildings?—Your obedient servant,

Tottenham, N. E. C. D.

"Constructional Iron and Steel Work," by F. Campin, price 3s. 6d., published by Crosby Lockwood and Son, is a book that would suit you. "Specification," price 5s., also contains much information on the subject.

### BUILDERS' LIABILITY FOR STABILITY OF STRUCTURES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I fixed a monument in our churchyard four years ago, and on that rough night, February 11th., it was blown down and broken. Now the parties to whom it belongs, wants to come on me for a new one. What can they do in the matter?

Bolsover. T. C.

They can do nothing, unless the destruction of the monument can be traced to the act or default of T. C. A builder does not insure the stability of a structure that he erects. He is only bound to execute the work in a skilful and proper manner.

### BUILDING CONSTRUCTION HONOURS EXAMINATION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—As I intend presenting myself as a candidate for the above exam., and am not connected with any school under South Kensington régime, I would be much obliged if you could inform me where I could procure the questions which have been asked in preceding years, and also as to the method of presenting oneself for examination.

Edinburgh. J. M. S.

The best thing to do would be to apply at the nearest science school for permission to attend the examination, which is always held early in May, names having to be entered much earlier. We fancy it is already too late to make application this year, even by special application direct to the Secretary, Science and Art Department, South Kensington, S.W., from whom papers set upon previous occasions are to be obtained at small cost.

### COKE BREEZE FLATS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have heard that coke breeze is now being used for covering roof flats in place of the usual lead flat. As this system would be much cheaper, perhaps some of our readers have laid down same, and could give par-

ticulars. I believe girders are placed at intervals of about 2ft. to 2ft. 6in. over the opening to be covered, and the spaces filled in with the coke breeze, and after this has become dry a kind of asphalt is laid on the coke breeze to render it watertight. Please state the proportions of coke breeze and cement, and the kind of asphalt used.

H. S. Cardiff.

Flat concrete roofs have been used for a number of years, and may be briefly described as a light form of concrete flooring laid on the slope, and provided with the necessary channels, &c., for collecting and carrying off the water. Concrete is frequently used as a weather covering, and may be laid on timber joists and rough flooring boards, or the supporting framework may be of iron or steel. Where the concrete alone is relied upon to keep out the rain it should be of good composition, and the surface well smoothed off with neat cement. Notwithstanding all precautions which may be taken to insure weather tightness, these roofs are frequently liable to slight cracking and leakage. What H. S. is apparently after is the more modern arrangement of forming the roof as a slab of concrete in which light H-section joists are buried at intervals, to assist in carrying and strengthening the concrete. An arrangement of this kind, when finished off with an asphalt coating, forms a very satisfactory roof. The section of girders depends, of course, on the span over which they are to be carried, and may vary from 3in. by 1½in. for spans from 5ft. to 6ft. (with a total thickness of concrete of 5ft.) to 6in. by 3in., or 7in. by 3½in. for spans up to 17ft. to 20ft. (with a total thickness of concrete of 8in. to 9in.). The usual spacing of girders is 2ft., but 2ft. 6in., or even 3ft. may be adopted in some cases, the strength of girder and thickness of concrete being proportionately increased. The coke breeze must be free from all dirt, slag, or other impurities, being, if necessary, well washed to insure this; and the best proportion is about one measure of Portland cement to four to five measures of coke breeze, or one measure Portland cement to three coke breeze and one fine clean sand. The upper surface of the concrete must be carefully laid with the proper slopes and water channels, and over the same a facing of asphalt, laid in two coats of not less than ½in. thick each, all carefully finished off and carried well up the face of any surrounding parapet wall. Seyssel Rock Asphalt is that most frequently adopted, as it is found to resist the action of the sun and weather well; but other combinations of asphalt, such as Val de Travers, &c., may be used. In constructing such a roof be careful that the supporting walls are properly set, as any settlement there is very likely to crack the concrete, and probably give rise to trouble. Do not paint or oil the rolled joists, as they will unite firmly with the concrete if left unpainted. Keep girders close to lower side of concrete slab. Allow the concrete to dry slowly, protecting it especially from the action of the sun. Be sure that the concrete is thoroughly dry before laying the asphalt, and be careful that this coating is laid in one sheet, without joint cracks or the like, and that a weather protection is made by carrying this well up against any walls or cornices, and that suitable and ample falls and water courses are laid.

ALEXANDER DREW.

The L.C.C. and Science and Art.—The Lords of the Committee of the Council on Education have given their sanction to the recognition, under Clause 7 of the Science and Art Directory, of the London County Council as a body responsible for Science and Art instruction within its area.

The Council of the Church House is appealing for funds to carry out the erection of the second section of the building. The great hall is finished and in use. There is a fair supply of committee-rooms, but they are in constant use, and more are urgently required. It is now proposed to erect the west side of the permanent building at a cost of about £18,000.

## Correspondence.

### FOUNDATIONS FOR FACTORIES.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The true engineer and architect, whilst fully alive to the results of actual practice, cannot afford to treat theory and experiment with the scant regard that is observed in Mr. Pearson's remarks, in your issue of March 1st, in reply to my letter. I think, however, that I may claim to have some experience, as well as theory, and as we are referring to soft soils, I may just say that I have recently put up four heavy and very large warehouses on the bad soil near the River Thames, but in various districts; and it is my experience and thirty years' practice that has induced me to advocate the theory laid down in my letter, which you kindly published. I say "advocate" because my blushing modesty compels me to disown the authorship with which Mr. Pearson has flattered me.

The point which I particularly emphasized, viz., Mr. Pearson's statement that the concrete should cover the whole surface of the site "in order to obtain uniform pressure" on the soil, he has not noticed. Does he still adhere to that statement? And when in his letter he states that a total load of 15,000 tons distributed over an area of 11,000ft. equals nearly 1½ tons per square foot, does he mean to say that the load is uniformly distributed over the whole area by means of the 3ft. slab of concrete? That is to say, that the ground under a column taking, say, 250 tons, receives no more pressure than the ground under a column taking 25 tons. Mr. Pearson must have an amazing faith in the virtues of a slab of concrete. I am an advocate for concrete and use it largely, but I have yet to learn that vertical pressure can be spread by means of concrete to a distance around the iron or brick base of a column of more than twice that of its thickness, unless steel girders are embedded. In the appended sketch I indicate the mean limit of pressure under ordinary circumstances. I now want Mr. Pearson to say how he manages to get the pressure transferred to the space between A and B so that it shall, as he states, be uniform with that under the columns.

I am not ashamed to admit that I cannot, by gazing on the surface of a site, or poking it with a stick, decide off-hand exactly how much it will safely carry, and that I prefer to make experiments where there is any doubt. It does not, of course, require a genius to say that a certain soil will carry 1½ or 2 tons, as the case may be; the question is, will it not safely carry 3 or 4 tons per foot, and if it will, the architect has no right to waste his client's money in unnecessary digging and concrete, as a result of mere guess work.

I think, sir, it will be useful to give the results of the experiments referred to so far as they have been made. I am designing a factory covering a site of about 15,000ft. super on doubtful ground, and desire to save my clients probably £1500, otherwise necessary for very deep foundations. The results are:—

Load per foot.	Settlement after Three Hours.	Settlement after Six Days.
3 cwt. of apparatus	—	—
½ ton	¾ in.	1 in.
1 ton	1 in.	1½ in.
2 tons	1½ in.	1 in.
3 "	1 in.	1½ in.
4 "	1½ in.	1½ in.

The experiments will be continued to 5 tons. Please note that this or similar ground loaded to 3 tons per foot may be expected to subside ¾ in. more than where loaded to only ½ ton per foot. Result—unequal settlement and disfigurement of building.

But Mr. Pearson's argument is that it does not matter what my theories are, that the fact remains that he has used whole site slabs of

concrete, and he believes them to have been successful. To this there are several answers: 1. An architect does not always know what happens to his buildings afterwards, and often the occupier himself is blissfully ignorant of some eloquent indications of unequal settlement. 2. If there is no serious or obvious movement, Mr. Pearson is fortunate in his ground. Some soil—sharp gritty sand, for example—soft enough to the spade, are, as a maiden soil, remarkably incompressible. 3. His distribution of loads may be symmetrical.

Mr. Pearson made one good point, viz., that the incidental loads may vary on any particular part of the floor from the shifting of stock. In answer let me say:—1. An ordinary warehouse may have from four to seven stories. It is extremely unlikely that in shifting-stock all the loads will follow simultaneously on corresponding points of each floor; in fact, so much is this principle of averages recognised, that it is customary in making calculations for columns and foundations to discount the floor loads as they accumulate downwards. There are, however, the permanent wall and fireproof

floor loads always present. 2. Assuming the utmost possible variation on any one part of the foundation, let it be remembered that once a soil is well compressed any temporary relief produces no movement. 3. There is, fortunately for many architects, a much better power of resistance in most soils than is expected, and the large margin of safety frequently saves them from serious disaster.

J. D.

### MOISTURE DURING FROST.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Under the heading of "Moisture during Frost," on p. 50 of your issue dated March 1st, your expert says "a painted wall would be much colder than a wall covered with paper in the ordinary way." This is quite a mistake. A thermometer will show that there is no difference, while it is surely obvious that as differences of heat so quickly "find their level," everything in a room, be it paper or paint, must be of the same temperature until again disturbed. I might explain that in touching different articles with a warm hand, what seems to be differences of temperature are really differences of conducting power. If we handle a stone at 70 degrees and a similar stone at 40 degrees we are sensible of losing heat faster in the stone at 40 degrees than in the other, and we say it is colder; and in this case it would be so. Then if we take up, say, a wool mat at 40 degrees, and a stone at 40 degrees, a similar effect is produced in the hand as in the former case, and we say that the wool is warmer than the stone. But it is not, for are they not both at 40 degrees? So the mistake is a natural one. But nature is not deceived in this way, and moisture condenses, according to actual temperature; although there are circumstances (not the difference between paper and paint) where the better conductor, simply because it is a better conductor, will be colder, and therefore produce more condensation.

"ENGINEER."

The National Portrait Gallery Trustees have accepted the gift of a portrait of William Hone, painted by George Patten, A.R.A. They have also purchased several pictures, among which may be mentioned an unfinished sketch in oils of Dr. Samuel Johnson, a portrait of Colonel Isaac Barré, and pencil drawings of Robert Louis Stevenson, by Percy Spence, and of David Garrick, by John Keyes Sherwin.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

March 15th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

### Diamond cut Diamond.

The "Globe" tells a good story of an architect who inspected a church in course of restoration, and discovered that the contractor had not used copper nails for the slating as stipulated in the estimate. He, therefore, informed the contractor that the slates would have to come off again. That evening he received a dozen bottles of port with a note from the builder begging his acceptance of the gift. The architect replied by sending the contractor a hamper of sherry, begging his acceptance of the gift, and concluding: "You will have to use the copper nails."

### The Housing Problem.

This difficult problem of the housing of the working-classes is not confined to the metropolis and very large towns. It crops up in all sorts of unexpected places. For instance, last Tuesday week an inquiry was held by the Local Government Board at Tunbridge Wells in respect to the Town Council's proposal to erect a number of cheap, sanitary dwellings for the many working families said to be unable to secure small houses in or near the borough at reasonable rates. It is estimated that a loan of £20,000 would be needed to cover the expenses of the scheme for the first batch of buildings. It is proposed to erect fifty-three cottages at 7s. per week rent, and thirty tenements at 5s. 6d per week. It was stated that one reason why speculative builders had not coped with the demand was that Tunbridge Wells, being a wealthy town, they had found it paid better to erect larger houses of the villa type.

### Coal-Smoke Abatement Society.

This is the title of the new Society which has been formed under the presidency of Sir W. B. Richmond, R.A. The hon. treasurer is Dr. H. A. des Vœux; the hon. secretary, Mr. Owen B. Thomas; and the offices (*pro. tem.*) are at 59, Chancery Lane. The society will limit its sphere of action at present to the metropolitan area; and its objects are as follows:—(a) To aid in enforcing to its utmost the existing law dealing with the smoke nuisance which is contained in the Public Health Act, 1891. (b) Where the present law

is inefficient to bring about an amendment. (c) To inquire into the present causes of the smoke nuisance, and the best means of removing or lessening the same, and to promote the investigation of appliances designed with that object. (d) To obtain evidence of the methods of dealing with smoke at home and abroad. (e) To promote the knowledge of methods by which the emission of smoke may be prevented, and for that purpose to encourage the organization of exhibitions and to stimulate invention by the offer of prizes. It has been decided that the Society shall give a gold, silver, and bronze medal to the three best exhibits in the Coal Smoke Abatement section of the Building Trades Exhibition shortly to hold in the Agricultural Hall. The medals are to be specially designed by Sir W. B. Richmond.

### Another Academy Election.

An election of an associate in place of the late Mr. Harry Bates will be held towards the end of the month, and it is said that the choice is likely to fall on an architect, who will probably be either Mr. John Belcher or Mr. Aston Webb. It is possible, however, that another sculptor may be preferred, on account of the lack of men available as visitors to the Academy modelling rooms.

### The L.C.C. and Art.

It is encouraging to find that there are members of the L.C.C. who are not desirous of restricting that body absolutely to the discharge of purely utilitarian functions. As we have no ministry of Fine Arts, it is well that the Council should accept a certain responsibility in regard to the artistic and historical side of London life. Mr. R. W. Granville-Smith, one of the representatives of Westminster, has given notice of a motion that it be referred to the General Purposes Committee of the Council to consider and report as to the desirability of appointing a new standing committee to be called the Art and History Committee, to which all questions of an artistic, archaeological, or historical character should be referred, so that the artistic claims or needs of the streets, buildings, monuments, antiquities, statues, and works of art of the metropolis may be fully considered. Mr. Sidney Webb has also given notice of a motion that in view of the fact that the Council possesses among its archives many records dating from the sixteenth century, the General Purposes Committee be requested to consider what steps can most conveniently be taken to publish a selection of such records as are of historic interest.

### Builders and the London Government Bill.

MR. R. ROBERTS, a builder who was for several years an Independent member of the London County Council, has been interviewed by a "Daily Chronicle" representative on the London Government Bill. His opinion was that it would be dangerous to London if the new municipalities had the Building Act to administer; what was wanted in the matter of building was a uniform standard all over London. He thought that the vestries were inclined to act in the interest of the owners of property, whereas the builders and the L.C.C., as a rule, took the broader view of the public interest. If, for instance, in a long thoroughfare between two parishes, where there were gardens in front of most of the houses, the owners were constantly trying to build on this private property, the Building Act line of frontage rule prevented them; but if influential people in one district managed to get permission to build on the gardens or forecourts, and permission was refused in the other section of the road, the thoroughfare would have anything but a pretty appearance. Besides the question of the building line, there were important sanitary matters. If in one district the sanitary officers condemned that which in another was approved, an architect would never know what would or would not be permitted, but with the Building Act he had only one authority to consider—the County Council.

**The Gladstone Statue.** THE proposal to erect a statue of Mr. Gladstone in the garden attached to Gwydyr House in Parliament Street has called forth two suggestions, both of which are worthy of consideration. The first is that the statue of James II., which at present stands in the garden, should be restored to its old position in the centre of the little court behind the Banqueting House. It is pointed out that this is the position in which it was originally placed by the King himself, and that it stood here for two centuries. The other suggestion is that the Gladstone statue should be erected in the middle of the new avenue that is to be constructed between the Strand and Holborn, a statue with four large bronze lamps surrounding it is what is proposed, and it is also suggested that the new street should be called Gladstone Avenue.

**A Dazzling Idea.** A MOVABLE roadway that is to be tried at the Paris Exhibition is being much talked of. A suggestion of something similar was made in the United States; it was proposed that a sort of multiple railway should be built between two towns there, distant 100 miles from each other. A railway track was first to be laid, and on this was to be a platform on wheels bearing another railway of shorter length, and on this a third railway carrying a train. All were to move at a great rate, and each travelling in the same direction would add its rate of progress to each of the others. Thus, if each was propelled at a rate of fifty miles an hour, the train would get over the ground at the rate of 150 miles. What an excellent scheme for adoption here! With footpaths on these principles and we should want no buses nor L.C.C. trams. But we hardly think our country is enlightened enough to adopt this great suggestion yet. We must come to it gradually by way of the Paris idea, which is a three miles an hour affair.

**Northern Architectural Association.** THE annual meeting of this association took place last Wednesday, the 8th inst. Mr. F. W. Rich, president, was in the chair. Mr. J. R. Wallace was elected an associate member, after which the prizes were presented to the successful students. Mr. A. B. Plummer, honorary secretary, read the annual report, which stated that during the year 1 member, 9 associates, and 14 students had been elected—the roll now standing: members, 50; associates, 59; students, 44; making a total of 153.—The honorary treasurer reported that there was a credit balance of £32 5s. 7d. Mr. W. Glover, who had been elected president for the coming year, then assumed the chair of office, and thanked the members for the honour they had conferred upon him. During his membership he had taken great interest in three matters connected with the association. First, a building to be its home; second, a good library; third, students' prizes; but to do that practical help must be given. For No. 1, he would give 100 guineas if they would raise 900; for No. 2 he would give 25 guineas if they would give 75; and for No. 3 he would give 25 guineas if they would give 75; and he would double his offer if they would double their help. That would raise 2000 guineas for the building, 200 for the library, and 200 for the students' fund, the interest of the latter to be devoted to prizes.

**King Alfred's Millenary.** A PUBLIC meeting was held last Thursday at Winchester, in connection with the proposal to commemorate Alfred the Great, by the erection of a suitable memorial in that town. The Marquis of Lorne, in proposing a resolution in support of a national commemoration in 1901, expressed satisfaction that art would be largely represented in this commemoration, inasmuch as a statue was to be erected, and that there would be a possibility, in regard to the proposed hall, of having historical representations in painting of some of Alfred's great achievements. The resolution was agreed to. The sum it is hoped to raise is £30,000.

## Professional Practice.

**Belfast.**—The foundation stones of St. Michael's Church were laid on March 4th. The site is a piece of unoccupied ground in Craven Street, off Shankill Road, and was purchased some time ago by the congregation for the sum of £1450. The cost of the entire structure when completed will be about £3300. The dimensions of the church are 104ft. by 74ft., and it will be capable of accommodating about 800 people, with about 150 more in the gallery. The style is Gothic, and the materials used are perforated brick, with Dumfries red grindstone dressings. The inside columns are to be built of white Bath stone, and all the woodwork will be pitch pine. Mr. James Kidd is the builder, and Mr. Samuel P. Close the architect.

**Caerphilly.**—The memorial stones of the new Congregational Church for Caerphilly were laid last week. It will cost about £400, and is to be built of native stone, with brick dressings. Mr. J. H. Phillips, of St. John's Chambers, Cardiff, is the architect, and Mr. J. H. Phillips, of Caerphilly, the contractor.

**Croydon.**—The new isolation hospital for greater London was opened on Saturday last week. It occupies a position just in the parish of Carshalton, and stands in five acres of ground. It comprises eight separate buildings. The building work has been carried on by Messrs. D. Stewart and Sons for £15,878. The plans have been prepared and the work executed under the superintendence of Messrs. R. M. Chart and Son, of Croydon.

**Dundee.**—A fountain has been presented to Errol by Sir William and Lady Ogilvy Dalgleish. It has been executed from a design by Messrs. Johnston and Baxter, architects, of Dundee, and is sculptured out of red stone from Dumfriesshire, with basins of polished Peterhead granite, the plan being trefoil. The height is about 13ft. Rising from the basin level, the pedestal takes a circular form. On one side a lion's head is carved, from which the water issues to supply the basins, with the overflow running into small troughs below for the dogs. The pedestal is capped by a moulded and carved cornice and base, on which rest the column and carved capital with scrolls and thistle ornament. On the top of the capital is placed the unicorn in bronze, with the Scottish shield in front. The work has been executed by Mr. Alexander Neilson, sculptor, of Dundee.

**Edinburgh.**—A new church is proposed for erection at the corner of London Road and Lochend Road, for the United Presbyterians. The general plan of the church is of a cruciform outline, with a gallery running round three sides, and is to seat 700. The west or main front is flanked by two low towers. Attached to the church is a large hall containing 300 sittings, at either end of which is situated the vestry and session house, and lavatory accommodation. A lower hall for school purposes is below this hall. The whole buildings have been designed in a free treatment of late Gothic Architecture. The total cost is to be £5000, and the competitive plans have been prepared by Mr. R. M. Cameron, architect, Edinburgh.

**Lancaster.**—The front of the "Guardian" Office buildings at Lancaster, a portion of which fell some time ago owing to building operations adjoining, is about to be rebuilt at a cost of over £900. Plans have been prepared by Messrs. Austin and Paley, of Lancaster, and the design will be in style similar to the old building which was erected in 1779. The work will be carried out by the following firms: Masonry, J. Thoms, of Grange; carpenters and joiners, R. S. Wright and Sons; plumbing, Abbott and Co.; slater and pavior, T. Cross and Son; painter, E. Payne; all of Lancaster.

## Views and Reviews.

### WHY CHIMNEY'S SMOKE.

We have received from Mr. Robert Crane, consulting domestic engineer, a pamphlet on the cause and prevention of smoky chimneys. The pamphlet is not written to advocate the use of some particular form of cowl or chimney pot. Indeed the author regards these so-called cares for the smoke evil as almost invariably useless. Of all the tallboys, windguards, revolving cowls, and chimney pots, now applied to buildings 90 per cent., Mr. Crane declares, might with advantage be removed if the cause of the evil were intelligently attacked. Such a consummation is devoutly to be desired from an æsthetic point of view, for nothing could well be more unsightly than the zinc and iron chimney pots and cowls that are so commonly resorted to when a chimney smokes. The great thing is to find out and remove the cause of the tendency to smoke. Some of the causes are discussed by the author in the pamphlet before us. Often the fault lies in the design of the house; even houses of the better class are often designed and built without the least provision being made for a continuous supply of fresh air. Every room ought to contain a sufficiency of fresh air to meet the requirements for supporting combustion without drawing from other rooms. Where this is not the case it is little good clapping a cowl on the offending chimney. There are many other reasons why chimneys smoke and in some cases the remedies are extremely simple. The author discusses them in detail and his suggestions are likely to be of service to builders and others who are sometimes at a loss when called in to doctor a smoky chimney.

"A crusade against Chimney Pots, Cowls, &c., or why Chimneys Smoke." By Robert Crane, 143, Cannon Street, E.C. Price 1s.

### THE GOUPIL GALLERY.

Granted a native inclination towards Art in one form or another, it is often chance that decides which of many possible Arts should be followed, and ultimately practiced professionally. There should remain to the architect a sympathetic understanding of all that appeals to the mind through the eye, and a consequent sympathy with art-workers in other fields than his own; so it is as likely as not that our professional friends will be willing to know what recreation the galleries offer, though at present there seems to be nothing more notable than a few masterpieces to be seen at the Goupil Gallery and the studies of "Picturesque Holland," which the Messrs. Dowdeswell are showing. It cannot be said of either that the poetical or picturesque aspects of buildings requiring drawing have provided the painters with subjects, but to-day we are taking a holiday, and suppose the eager eye of the architect to be diverted from its usual quarry.

It is not so generally remarked as it should be—the influence of the French being so obvious—how much of the Protestant Art of this country, concerned as it is with portraiture, landscape, and purely domestic scenes, may be attributed to the Revolt in the sixteenth century, which made Holland autonomous, nor how entirely in the spirit of their greatest masters, regarding both subject and treatment, are the works of the modern Dutchmen: Israels, Maris, Neuhuys, and others who might be mentioned. The domestic scenes of their choice are epic in their simplicity, and in point of execution superb. It was observed by the earliest chiaroscurists that whoever would intensify feelings of reverence had only to concentrate light on the principal object, the non-essential being noxious in Art as in argument, and this art, applied first by Italians and Spaniards to what was considered most sacred, was carried further in Holland under more various climatic conditions, and shown to be applicable to almost everything lovable. The paintings exhibited here have many characteristics in common, and whether by Dutch, English, or French, the general feeling will be that it is

not a mixed entertainment. Though there are but forty pictures in all, they are most of them excellent, and it is hardly possible that the visitor will be disappointed. Mr. Hornel finds the subjects of his paintings in Japan, but considering their quality they seem not at all out of place in this gallery.

### THE DOWDESWELLS' GALLERY.

A native of Holland is exhibiting at the Dowdeswell Gallery some water colour drawing and frescoes, and from the fact that even on Press-day there were more than a few marked "sold," it may be inferred that this little exhibition will be one of the most successful. It is not our business to sell pictures, however, but simply to note what is best and advise. The painter, Nico W. Jungmann, has brought in his train a selection of maidens from Holland attired as they would be at home, and their faces and holiday dresses are as well remembered at least as the paintings. Out of forty or fifty paintings there are only four or five landscapes, and these in a country so riddled with water-ways can hardly be so described. The artist is young, and probably restless, for what we lack in these paintings is the feeling of peace that results from the contemplation of scenes that respond by their composure to one's own unuttered request. They are graphic however, and capable as they are faithful; but, putting these few aside, there remains so much to delight in the naïveté and utter fidelity of the various character sketches that it would be impossible to speak of them fully. There may be discerned in the works of past masters, Italian, Flemish, or German, a searching understanding of actuality which has taught us to expect, from caricaturists, an ideally real representation, "exclusive and parsimonious," and by virtue of these characteristics, the illustrator of the "Bab Ballads" has a very sure place among artists, while the same might be said of Phil May and some hundreds of others who know what it is to be graphic.

The artist, as might be expected, is a more accomplished draughtsman than painter. In all or nearly all his studies from life the quality is of the highest, so stubbornly real they are; amusing without being absurd, and so scrupulously chosen with regard to what is most telling that the writer who would if he could be critical has little or nothing to do. The fact that either in line or colour they could all be reproduced perfectly will probably lead to his fame being spread to the ends of the earth before long.

**Plans of Workmen's Buildings** and erection estimates are to be submitted by the City surveyor to the Sheffield City Council.

**A Site for a Technical School** and Free Library at Eastbourne has been presented by the Duke of Devonshire. The Town Council have decided to invite competitive designs for the building to be erected, at a cost not exceeding £20,000.

**The Death of Sir Douglas Galton, K.C.B.**, took place last Friday afternoon at his residence in London. He was born in 1822, and got his commission in the Royal Engineers in 1840. In 1842 he directed the removal of the wreck of the Royal George at Spithead, and the construction of fortifications at Gibraltar and Malta. He was engaged on the Ordnance Survey in 1846, and on the Railway Commission in the following year. Appointed in 1859 Assistant Inspector-General of Fortifications, Lord Herbert entrusted him with the construction of the Herbert Hospital at Woolwich, at that time the largest Military Hospital in the world, having as many as six hundred and fifty beds. In 1860 he was Assistant-Inspector-General of Fortifications, and from 1862 to 1870 Assistant Under-Secretary for War. For twenty-five years he was the general secretary of the British Association, and its president in 1895. Sir Douglas Galton was one of the highest authorities on hospital construction, sanitation, ventilation, and hygienic arrangements in general, and his loss will be severely felt in the scientific world.

## BRADFORD FIRE STATION COMPETITION.

IN our issue for March 1st we published an article on the above competition, in which we criticised the accepted designs and pointed out that competitors might reasonably feel aggrieved at the manner in which the competition was decided. So strong and so general was the dissatisfaction that some of the competitors determined to make a united protest, and as a result the following letter was drawn up and forwarded to the Corporation of Bradford:—

"To the Mayor and Corporation of the City of Bradford.

"20, John Street, Adelphi,  
Strand, W.C.

March 10th, 1899.

"GENTLEMEN,—We, the undersigned, having submitted designs in the recent competition for the Central Fire Station, desire to call your attention to the very unsatisfactory result of the competition, and to protest against the manner in which the Adjudicating Committee have made their selection and exhibited the designs without notification to competitors.

"The points we desire to bring under your notice are:—

"1.—That three distinct and separate schemes submitted by one competitor have been collectively awarded the first premium, and that no notification is made as to which of these designs is considered by the committee to be the best or the most suitable for the requirements of the Corporation. We do not contest the right of any competitor to submit alternative designs, but the essence of a competition of this kind is that each design must stand upon its own merits in its comparison with its competitors. How is it possible that three separate designs can be collectively compared with any one individual design? We venture to think that the committee have in effect failed to make any selection whatever for the first premium within the terms of the second of the conditions, under which the competition was held.

"2.—That no notification was given to competitors of the time or place of the public exhibition of the drawings, which, in fact, were only on public view for one day, immediately following the day when the selection was made. The obvious result of the want of notice and the shortness of the time during which the designs were exhibited was that few, if any, of the competitors were able to see the selected designs in conjunction with the other designs, and they thus had no opportunity of forming an opinion upon their relative values. We have not unnaturally considered the course, which has been taken as suggesting to the competitors and the public that open criticism of the design would be unwelcome.

"3.—Having regard to the stringent and very proper conditions forbidding distinguishing marks, the use of small photographic plans by the premiated authors is to be regretted. Also we believe that the drawings which obtained the first premium are coloured, thus affording a ready means of identification. It was expressly provided by condition 12 that the elevation and perspective must not be coloured, but finished in Indian ink. One object of this provision being no doubt to exclude what might be made a distinguishing mark. We desire to point out that condition 17 declared that any design, the preparation of which did not comply with the conditions, would be rejected. We feel sure that you will agree with us that in a public competition of this kind which necessarily puts professional men who compete to considerable trouble and some expense, the conditions and representations under which designs are invited and upon the faith of which they are prepared and sent in ought to be strictly adhered to. It is however, obvious that if the committee had acted upon this principle, they could not have awarded the first premium to the designs which they selected.

"4.—We do not propose to discuss any of the debatable points in the selected designs. We

have, however, no knowledge of any Central Fire Station which has been erected for anything like so small an amount as about 4d. per foot cube, at which the buildings work out in the estimate attached to the premiated designs.

"Having enumerated the points upon which we are compelled to protest, we would ask the Corporation, in order that the matter may be removed from any suspicion of partiality or irregularity, to suspend its adoption of the award of the committee, and to invite (under condition 5) the president of the Royal Institute of British Architects to nominate an expert to assist them in making their selection.

"We also beg to request that when the selection is finally made, a public exhibition of all the drawings may be held, of which due notice shall be given to all the competitors.

"We are dear Sir,

Your obedient Servants,

This letter is signed by nineteen of the competing architects.

What action, if any, will be taken by the Bradford Town Council in reference to the protest remains to be seen, but it would appear that steps have already been taken towards carrying out the design to which the committee—in spite of its non-compliance with their conditions—have given their approval. The following paragraph appeared in the "Yorkshire Post" for March 7th: "The Bradford Watch Committee yesterday decided to accept the plans of Messrs. Mawson and Hudson, architects, of Bradford, for the new Fire Brigade Station. The Committee recommend the Council to approve of the plans, and to apply for powers to borrow £30,000 to carry out the work." It will be remembered that one of the conditions of the competition was that the limit of cost was to be £15,000.

## Keystones.

**A new Public Hall** is proposed to be erected at Woodside, Aberdeen.

**North Lonsdale Hospital.**—The memorial-stone of "Schneider" Ward was laid last week.

**Surfleet Church** has been Examined by Mr. Hodgson Fowler, F.S.A., and he thinks that the cost of its restoration would be about £2000.

**Newcastle New Infirmary.**—The site for the new infirmary on the Castle Leazes has been approved of by the freemen of Newcastle-on-Tyne.

**Aberdeen Art Gallery** is to have cupolas placed in the side roofs, a floor laid with pitch pine blocks, an orchestra erected over the gallery, and turnstiles erected at the entrance hall.

**A Memorial to Sir Frank Lockwood** was unveiled in York Minster on Tuesday last week. It consists of a stained glass window in the eastern side of the north transept, representing St. Paul.

**Battersea Polytechnic.**—Sir Henry Tate has offered to present a large organ for the new hall of the Battersea Polytechnic. Sir Henry gave the munificent donation of £10,000 towards the establishment of the Polytechnic.

**Partnership.**—Mr. George E. Clare, M.S.A., who has been practising at 66, Duke Street, Chelmsford, has taken into partnership Mr. Walter G. Ross, and opened a London office at 1, West Street, Finsbury Circus, E.C.

**New Hospital at Hampstead.**—Sir Henry Harben has promised £3000 to the building fund of the New Hampstead Hospital, provided the £14,000 required is raised by June 1st. £3050 has already been raised from other sources.

**St. Mary's Church, Wanstead,** is in great need of repair, and an appeal is being made for funds. Sir A. W. Blomfield says the tower and the north aisle roof are in urgent need of speedy attention. The tower cannot be considered safe.

## Under Discussion.

### BRITISH ARCHÆOLOGICAL ASSOCIATION.

The seventh meeting of the current session of this Association was held at the rooms in Sackville Street on the 1st inst., C. D. Compton, Esq., V.P., in the chair. Dr. Perry, president of the Spalding Gentlemen's Society, exhibited a so-called hand brick about 4in. in length, tapering from 2in. wide at one end to 1½in. at the other end, which was considered to have been used in the formation of a pavement, as similar hard bricks were discovered in the foundation of an old church at Waynfleet, *in situ*, as a pavement. In this case they were rudely shaped cylinders of baked clay. Mrs. Day exhibited some fine drawings and engravings of St. Magnus Cathedral, Orkney, and Mrs. Collier some engravings of brasses from Brundish Church, Suffolk. The Rev. W. S. Sach-Szyrma, M.A., read a paper upon an interesting but little known subject, viz., "Ancient British Costume," or rather the costume of the early inhabitants of this island, prior to the Aryan immigration here of the Celts and Cymri. He said we find little to lead us to any satisfactory conclusion as to the probable ancient costume of the inhabitants of early Britain from the study of the savage habits and customs of the races of Australia and Africa, because the climate of those countries is more or less warm all the year round, but the climate in Britain in winter, since man settled in the island, must always have been severe, and we can hardly imagine an English winter in which the people had no need for fairly warm clothing. The author conceived that the traditional costume of early Britain may be best traced in Wales and the Scotch Highlands. A discussion followed the paper.

### AN ATTACK ON JERRY-BUILDING.

At the annual dinner of the Aberdeen Master Masons' Association, held on March 3, Mr. James Souttar, in reply to the toast of "The Architects," said that of late years his heart had failed a little on account of the immense number of buildings which were got up of very little merit. Of course they, as architects, got the blame for it, and one friend that night was anxious that they should show their skill in some directions, but probably before they got the opportunity some little speculator would step in and start building houses. These speculators would perhaps get an articulated pupil in some architect's office to give them a plan, breaking every article of his agreement, or perhaps they would get some fellow, for a few drams or drinks, to prepare the plans, so that they might pass through the Town Council. The municipality legislated beautifully about the thickness of the water pipes and about the cementing of the drain pipes, and about the lines and levels. Beyond that they could build as they liked. They could put in posts that would not support the joists, and that would not support the masons' scaffolding, and what was the consequence?—down came the scaffolding with three or four men beneath it. He thought what the municipality had to do was to have a superintendent of works, and when a plan came in before the Plans Committee they ought to see that a responsible man was placed over the buildings, to see the building carried out to its finish. Since he spoke last on the system of jerry-building, when he expressed regret at the way houses were being erected, without any plans or specifications or schedules or superintendence, they had had some serious accidents in connection with buildings. Some one ought to be responsible not only for lines and levels, not only for pipes and drains, but to see that the plans and specifications of buildings to be erected within the jurisdiction of their municipal authorities were prepared by responsible and qualified architects, who would continue to carry out the works and be responsible for them to the end. Legislation was provided in other cities affecting masonry as to thickness of walls in due proportion to

their height, as to character of masonry and bond, as to the number of chimneys allowed in a certain thickness of wall, as to the thickness of posts supporting joists and flooring, as to strength of joists and beams, and as to the stability of a building throughout—its roofs, stairs, materials, &c. The municipal legislation dealt peremptorily with the thickness of their water and gas pipes, the character of their plumber work and their drainage, but it had never reached the more vital question of their sewer ventilation. If the masons refused to undertake jerry building, and refused the offers of the speculators who wished buildings rushed up in an outrageous and wrong manner, then they would have an end to the system. If a man put up a jerry building and death occurred as the cause of it, he was liable to be brought up for culpable homicide or manslaughter. Architects were also liable if they passed the plans of such a building, but what they wanted was that the blame should fall upon the right man. If they stuck up for buildings being erected in a proper way then they would have reason not to be ashamed of their good old city.

### A DIFFICULT SURVEY.

At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on March 6th, Mr. John C. Fell, President, in the chair, a paper was read on "The Shan Hill Country and the Mandalay Railway," by Mr. E. Wynter Wagstaff, A.M., Inst., C.E., Executive Engineer, Burma Railway. In this paper the author gave some particulars of surveys carried out by him in connection with the location of a line of railway through the Northern Shan States from Mandalay to the Salween, now known as the Mandalay-Kunlon Railway. The paper contained a special description of the work on that portion of the line known as the Gokteik Gorge, a deep ravine or cañon which cuts the line about eighty miles from Mandalay. The chief engineering difficulties were the Ghat between the fifteenth and thirty-fifth mile, with a rise of about 3200 feet, and the Gokteik Gorge, with a fall and rise of about 1400 feet in eight miles. The author described the method of conducting the survey, which was carried out in this remarkable ravine under great difficulties, and sometimes dangers. The system adopted was a series of compass traverses along the hill side above and below the belt on which it was assumed the line would probably fall. A way was cut through the jungle by a working party, the compass officer following with a couple of levellers. These were followed by another leveller, and behind him came yet another taking cross sections. Each day's work was plotted on return to camp. A rack line was marked out on the basis of an incline of 8 per cent., and submitted to the Government. Subsequently a new survey was made with the view of a 4 per cent. adhesion line. Ultimately another survey of the gorge was made, and a 2½ per cent. grade was obtained, thus making this portion uniform with the rest of the line, which has a ruling gradient of 1 in 50. The works included a viaduct 2000ft. in length, with a maximum pier height of about 320ft. A natural bridge occurs in the Gokteik Gorge, and upon it is an interesting monument with an inscription in Chinese, setting forth the date of the construction of the caravan track, and the names of those who made it. This track consists of what is practically a winding flight of irregular steps, in many places cut out of the solid rock. It is said to have cost a lac of Rupees. The channel under the natural bridge is approached by a cavern of great natural beauty. The walls have been coated by the infiltration of lime-charged water, with a brilliant white covering, and this in its turn has been painted in soft pinks, and greys and greens, from traces of various minerals. The entrance is blocked with foliage and masses of ferns partially petrified with every delicate frond intact.

The New Buildings to be occupied by the Stirling Co-operative Society has been opened. Messrs. M'Luckie and Walker are the architects.

Ruskin's Old House at Herne Hill is shortly to be put under the hammer.

A New Cancer Ward was Opened at the New Hospital for Women in Euston Road last week.

The Aberdeen Painters have gained the day, the standard minimum wage being now 8d. per hour, and they have resumed work.

M. Vilain, a French Sculptor, who, in 1838, won the Grand Prix de Rome, died in Paris at the end of last week at the age of eighty-five.

H.M.S. Implacable was Launched last Saturday. She has a displacement of 15,000 tons and 15,000 indicated horse power. The length is 400ft., and draught 26ft. 9in.

The Patent Office.—The work of clearing the ground at the rear of Staple Inn and Southampton-buildings for the erection of the Patent Office Library has been commenced. The new premises will take three years to erect.

The Public Baths for Portobello were discussed at the meeting of the Edinburgh Town Council on March 7th. The Plans and Works Committee recommended the acceptance of the estimates, amounting to £24,758, and this was finally agreed to.

Cruden Bay Hotel has been formally opened by the directors of the Great North of Scotland Railway Company. It is a handsome and well equipped building, and has been erected to designs by Mr. John J. Smith, A.R.I.B.A., the company's architect.

The Byron Statue at Aberdeen.—At a meeting of the sub-committee, appointed in connection with the movement to erect a Byron statue in Aberdeen, held last week, it was unanimously agreed to appoint Mr. P. Macgillivray as sculptor of the statue.

Aberdeen School Board.—At a meeting of the School Buildings Committee of the Aberdeen School Board last week, it was resolved to have the Kitty Brewster School opened, if possible, in June, and with this view instructions were given to push forward the work.

Proposed new Fire Station for Cardiff.—The Chief Constable of Cardiff has brought to the notice of the Watch Committee the necessity for providing new and larger premises for the accommodation of the Cardiff Fire Brigade. The matter has been referred to a sub-committee.

St. Peter's Church, Plymouth.—As a memorial to the Rev. George Rundle Prynne, who for more than fifty years was the vicar of the Parish of St. Peter's, Plymouth, the subscribers to the fund are trying to complete the tower of St. Peter's Church. This will cost £2600, and the amount already in hand is £1616 14s. 4d.

A Statue of Victor Hugo is to be erected in the poet's native town, Besançon. A committee was formed there in 1885 to erect one, but, although fourteen years have elapsed, only £800 has been subscribed. The matter is now in the hands of a sculptor, and it is hoped at Besançon that the statue will be ready in two years' time.

New Municipal Buildings are to be erected at College Park, Dumbarton, and the plans were passed on Monday last week. Mr. Thomson is the architect. The cost is estimated at about £15,000, and the contractors are: Mason, Mr. William Barlas; joiners, Messrs. M'Leod and Sons; plumbers, Campbell and Cameron; slater, Mr. Mackie Thom. The cost is exclusive of the site, which is the gift of Lord Overton.

The Building Trade's Exhibition at the Agricultural Hall will be opened on April 26th by Professor Aitchison, R.A. (President of the Royal Institute of British Architects), supported by the Duke of Westminster, Sir Wm. Richmond, R.A., Sir Arthur Blomfield, A.R.A., G. T. Bodley, A.R.A., Robert Vigers, Esq. (President Surveyors' Institute), G. F. Fellowes-Prynne, Esq. (President Architectural Association), Alfred Waterhouse, Esq., R.A., T. Blashill, Esq., Architect, London County Council, Sir Alfred Hickman, M.P., Sir Wm. Arrol, M.P., and others.

## COMING EVENTS.

Wednesday, March 15.

MANCHESTER MUNICIPAL SCHOOL OF ART LECTURES.—Sir Thomas Wardle, on "Calico Printing as an Art." 7.30 p.m.

SOCIETY OF ARTS.—Ordinary Meeting at 8 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers).—Inspection and Demonstration of Disinfecting and Filtering Appliances at the Lambeth Disinfecting Station, Wanless-road, Loughborough-junction, at 3 p.m. Conducted by Mr. Wolf Defries, B.A., M.L.C.E.

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Ordinary meeting of the members. 8 p.m.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—(1) Mr. C. A. Donnelly on "The Crannog at Dumbuck." (2) Mr. C. Dack on "Survival of Old Customs at Peterborough." 8 p.m.

Thursday, March 16.

ROYAL INSTITUTION.—Mr. William Poel on "English Play-houses in the Fifteenth, Sixteenth, and Seventeenth Centuries." II. 3 p.m.

SOCIETY OF ANTIQUARIES.—8.30 p.m.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—Mr. E. Doran Webb, F.S.A., on "The Diary of a Sarum worthy of the Seventeenth Century." Mr. Philip H. Newman, R.B.A., F.R.S.I., in the chair.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers).—Mr. Henry R. Kenwood, M.B., D.P.H., &amp;c., on "Infectious Diseases and Methods of Disinfection." 8 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Student's visit to the Generating Station of the South London Electric Supply Corporation, in course of construction. 2.30 p.m.

Friday, March 17.

ARCHITECTURAL ASSOCIATION.—Mr. Reginald T. Blomfield, on "Reflections on the English Renaissance." 7.30 p.m.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMAN'S SOCIETY.—Mr. W. G. Peidle on "Electric Lighting of Buildings." Mr. G. Davidson on "Levelling." 8 p.m.

Saturday, March 18.

ROYAL INSTITUTION.—The Right Hon. Lord Rayleigh on "The Mechanical Properties of Bodies." VI. 3 p.m.

SANITARY INSTITUTE.—(Demonstrations for Sanitary Officers).—Inspection at Morden Hall Farm, Morden, Surrey. 3 p.m.

PERTH ARCHITECTURAL ASSOCIATION.—Visit to Brahan House, near Tulloch. 2.30 p.m.

Monday, March 20.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Mr. John Bilson, F.R.I.B.A., on "Beginnings of Gothic Architecture: Norman Vaulting in England." 8 p.m.

VICTORIA INSTITUTE.—Meeting at 4.30 p.m.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Election of Officers, and Annual Report presented. 6.30 p.m.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. H. B. Bary, F.R.I.B.A., on "Notes on American Architecture," and Mr. J. H. Hook on "New York Office Buildings."

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers).—Dr. Louis Parkes, D.P.H., on "Water Supply, Drinking Water, and Pollution of Water."

Tuesday, March 21.

SOCIETY OF ARTS.—Meeting of Foreign and Colonial Section at 4.30 p.m.

Wednesday, March 22.

EDINBURGH ARCHITECTURAL SOCIETY.—Open discussion. Mr. W. N. Cumming (will open the debate, Mr. T. R. Paterson moving the previous question.

SOCIETY OF ARTS.—Ordinary Meeting at 8 p.m.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

## PUBLIC ABATTOIRS FOR LONDON.

At a meeting of the Sanitary Institute, held last Wednesday at the Parkes Museum, Margaret Street, W., Mr. E. B. Forman, L.C.C., presiding, Dr. William Arthur Bond, Medical Officer of Health for Holborn opened a discussion on "The Establishment of Public Abattoirs in the Metropolis in Relation to the Prevention of Tuberculosis." Dr. Bond began by summarising the conclusions of the last Royal Commission on Tuberculosis, and also of the former one, which reported in 1895, he then referred to the experiments of Dr. Klein and Dr. Sydney Martin, which tend to show that tuberculosis is often caused by the eating of diseased food. The disease, said Dr. Bond, is exceedingly prevalent among cows but less so among sheep and calves. The inspection of the animals, to be efficient, must take place at the time of slaughter, as it is only then that the organs belonging to the animal can also be adequately inspected. In addition to the inspection of meat slaughtered in the public abattoirs, there will still remain the need for inspection of carcasses brought from other districts. Dr. Bond was of the opinion that, with efficient inspection of all meat, properly constructed public abattoirs would be advantageous to the stockowner, the butcher, and the consumer for the following reasons:—

### 1. To the Stockowner,

because (a) increased inspection would make him try to eliminate tuberculosis and other diseases from his stock, and thus diminish his losses. (b) In London some 5000 butchers, instead of only some 450 who have private slaughter-houses, would have the opportunity, if they so desired, of slaughtering home-fed animals. (c) The consumer would know home-fed meat and have a guarantee that it had been passed as sound, so that there would be increased demand for such meat.

### 2. To the Butcher,

who dealt in home-fed meat because (a) Of the increased demand for it. (b) The monopoly of those having private slaughter-houses would be prevented. (c) His losses, especially in summer and muggy weather, would be much diminished, as his meat could be well kept until required for sale in the cooling chambers or cold-air stores provided in the public abattoirs. (d) His heavy expenses for ice, especially during the summer, would be diminished, and his savings from this alone would more than pay for the small sums that would be charged for the cooling chamber.

### 3. To the Consumer,

especially to the poor, because he could ensure a meat supply wholesome and free from disease, especially tuberculosis. The additional cost, if any, would be so infinitesimal that it may be neglected. On account of the enormous population of London, the efficient inspection of all meat coming into it would make stockowners careful to eradicate tuberculosis from their herds, and in this way the milk supply would also be much improved, and therefore human tuberculosis would also be diminished. This diminution of tuberculosis would be the greater the more universally the recommendations of the Royal Commission were carried out. Dr. A. E. Harris, M.O.H. to the Islington Vestry, has thus stated the reasons for providing public abattoirs:—

#### 1. Hygienic Reasons.

(a) That the erection of such buildings would remove nuisances from the neighbourhood of dwelling houses. (b) That it would exclude putrifiable matter from the sewers. (c) That it would protect meat from the liability to exposure from foul emanations. (d) That it would ensure the thorough examination of all meat for disease. (e) That it would materially tend to limit the traffic in diseased meat.

#### 2. Economic Reasons.

(a) That the meat would be less liable to spoil, because slaughtered under better conditions. (b) That much blood and offal now

lost would be entirely saved. (c) That there would be a saving from order, the proper division of labour, avoidance of driving animals through the streets, and the doing of business on a large scale. (d) That abattoirs publicly managed yield a fair profit.

### 3. Humanitarian Reasons.

(a) That much of the cruelty to animals that now occurs would be put an end to, owing to the use of improved appliances for slaughtering. (b) That the driving of weary and exhausted cattle through our streets would be avoided, owing to the abattoirs being situated near railway stations. (c) That the street danger to the public would be greatly lessened, if not altogether eliminated. Dr. Bond then gave a short account of his

### Experiences in Holborn,

as showing the necessity for the efficient inspection of all meat, and the provision of public abattoirs. About one-third of the diseased meat "seized" has been for tuberculosis. This meat has come from very many counties of England, and some also from Scotland, Holland, and Belgium. Nearly all the tubercular carcasses seized were cows; a few were pigs or oxen. The average weight of these cows was under 350lb. In the first quarter of the year 1896, at the beginning of which the meat inspector began his duties, there were more than 4000 stones of diseased meat seized, or at the rate of more than 16,000 stones per annum. This is exclusive of diseased offal. Legal proceedings were taken against many of the offenders, and in a very large majority of the cases fines or imprisonment were inflicted. For several years prior to the appointment of this special meat inspector there had not been a single conviction obtained for exposing or depositing for sale diseased meat. This fact proves the necessity for efficient inspection. The enormous area and population of London made it desirable that there should be at least six public abattoirs. In Glasgow, the second city of the United Kingdom, there are three; in Manchester, another very large city, there is but one; and in both the system has been

### A financial Success.

The Royal Commission states—Part II., p. 341—that all the public slaughter-houses in Germany are self-supporting. The slaughter-house charges vary in different towns, thus:

	Cattle.	Calves.	Sheep.	Lambs.	Pigs.
	s. d.	s. d.	s. d.	s. d.	s. d.
Glasgow .....	0 9	0 1½	0 1½	0 0½	1 0
Manchester .....	1 6	0 4	0 2	.....	0 6
Liverpool .....	1 6	0 6	0 1½	.....	0 6
Leeds .....	1 0	0 4	0 3	.....	0 3
Germany .....	2/- to 5/-	4d. to 1/-	4d. to 1/-	.....	1/- to 2/-
		(Reckoning a Mark as a	Shilling.)		

Osthoff also gives the charges made for weighing, inspection, and lairage, that for the first day being free; also details respecting the cost of erection of the public slaughter-houses, with or without cooling chambers, and the charges made for the use of the latter, which are from 14s. to 40s. per annum per 10 square feet.

### Arrangement of an Abattoir.

In the best modern slaughter-houses the slaughtering is done in large halls, separate halls being provided for cattle, for sheep and calves, and for swine, also a small one for diseased animals. Associated with the slaughter-house is the cattle market, and both are in direct connection with the main railway lines. On the premises also are buildings for carrying out the various processes incidental to slaughtering, such as fat melting, bone boiling, gut scraping, and the extraction of albumen from blood, &c. In the newer slaughter-houses there are large cooling rooms, and provision for microscopical and pathological examinations, &c. The lecturer then dealt with some of the objections that have been raised against public abattoirs. Private slaughter-houses are said to be more

convenient to the butcher. There are about 5000 butchers in London, and of these less than 450 have private slaughter-houses, so that the abolition of these latter could not certainly cause any inconvenience to the great majority—more than ten to one—who do not possess them. The greater number of these have to go several miles to get their meat at the Central Meat Market or Deptford. And of those that have private slaughter-houses many have to go several miles to the Cattle Market, Islington, or other markets, and have the animals driven through the streets. Moreover, those who have private slaughter-houses generally sell their meat in addition to that of their own killing.

### Belfast and Glasgow.

In Belfast, where the number of private slaughter-houses has been reduced from thirty to five, many of the butchers who do not slaughter in the public abattoirs have had private slaughter-houses built outside the city where the inspection is not so rigorous, and on that account willingly put up with the inconvenience of sending their man a long distance to do their slaughtering. In Glasgow, where private slaughter-houses have been abolished, the butchers now express a strong preference for the public slaughter-houses over the old system. Another objection is that meat killed in a private slaughter-house keeps better and retains its freshness better than meat killed in a public slaughter-house. A similar objection was raised by Mr. Hart, of the Central Meat and Poultry Markets Association, who urged that the establishment of public slaughter-houses, requiring more handling and carriage of recently killed meat, would "destroy the unique characteristics of home-killed meat." On this point Dr. Bond quoted the remarks of Mr. Shirley Murphy, Medical Officer of Health to the London County Council, who said that the slovenly and disgusting habit of piling the carcasses into carts, the driver often sitting on the top, was in marked contrast to the methods adopted in well-ordered foreign cities, where meat was conveyed to the butcher in specially constructed, well-ventilated vans, from the roof of which the meat is suspended. The paper concluded with the following extract from one of Sir Richard Thorne's Harben lectures:—"How is the very proper demand of the butchers for uniformity in the condi-

tions regulating the seizure of carcasses on account of tuberculosis to be met? How is such skilful handling of slightly tuberculous carcasses to be attained as will secure the removal of the diseased portions in such a way that no risk shall attach to the remainder? I only know one answer, namely, by the abolition, as far as practicable, of private slaughter-houses, by the provision in all large centres of population, whether technically styled urban or rural, of public slaughter-houses under the direct control of the sanitary authorities and their officers, and by the adoption of measures which will, as soon as practicable, provide a class of skilled meat inspectors. The properly administered public slaughter-house is demanded as an act of justice to those trading in meat; it is demanded in the interests of public health and decency; it is demanded for the prevention of cruelty to the lower animals; and it is demanded in order to bring England, if not the United Kingdom, somewhat nearer to the level of other civilised nations in this matter. Public slaughter-houses, officered by skilled inspectors, and supervised by medical officers of health, are urgently required, amongst other reasons,

for the prevention of tuberculosis in man." The discussion was opened by Mr. Thomas Blashill, architect to the London County Council, who exhibited to the meeting a sketch plan of an abattoir suitable for a small town or a district in the suburbs of London. Mr. Blashill explained that he had, at the request of a committee of the L.C.C., visited many cities on the Continent to study the different systems of public slaughter-houses. The plan represented a square piece of ground, with a road on one side and a railway on the other. The cattle arriving by railway would be received into a series of lairs or pens, in which the veterinary inspector can take a general view of them. If he sees anything the matter with them they are taken off to a place set apart for diseased animals. In the case of pigs, the animals are given a preliminary bath. There are separate pens for horned cattle, calves, pigs, and sheep, and separate abattoirs for each class of animal.

#### The System in Germany.

The system, said Mr. Blashill, was extending rapidly in Germany, and within ten years there would not be a German town, however small, which would not have its public abattoir. The animals are kept in the lairs for a few days until they are wanted. In the slaughter house every part is clean. The buildings are no disfigurement to the vicinity, being as ornamental in appearance as our best modern hospitals. The cattle are led into the slaughter hall with a mask over their faces which contains the spike with which they are killed. All the animals are slaughtered on one side of the hall, and the carcasses are then hung on the other side. Along the central passage the medical inspector is constantly walking. Directly the animal is killed the different parts of the viscera are hung up on hooks each in its proper place. If the inspector is satisfied with the viscera, the meat is passed, he puts a stamp on it, and his assistant stamps every piece of the carcass. If unsatisfactory, it has to undergo further examination.

#### Conveniences for the Butcher.

If the butcher does not want the meat immediately, it is run across on a trolley to a cooling chamber kept three or four degrees above the freezing point. Every butcher rents small cells in which he keeps veal, pork, and the smaller joints of beef. The butchers take their meat away in covered vans, leaving behind them at the abattoir any they may not require for immediate sale. Ice is made on the premises, and sold to the butchers at reasonable prices. In connection with the abattoir there would be the office of the superintendent, and residences for some of the attendants. Then there would be a hall for business transactions, with refreshment room attached; also accommodation for vans and horses, and for the men engaged in the work. A market for hides and skins, and a food store, would also be provided. The meat of the condemned animals, if not very bad, is sterilised and sent to shops where it is sold at very cheap rates. This meat is really entirely good and the demand for it exceeds the supply. Mr. Blashill's experience of foreign abattoirs was that they were entirely cleanly and free from anything offensive, that they were self-supporting, and were generally approved by all parties concerned. His enquiries led him to believe that the erection and fitting up of slaughter houses in London could be carried out without any charge on the community.

#### The Butchers' Case

against public abattoirs was stated with great clearness and force by Mr. A. Redman, who maintained that the Royal Commission and the medical faculty had failed to prove how very grave the risk was from a slightly tuberculous animal. The doctors could not prove that any man ever acquired tuberculosis directly from eating meat. They drew their inferences from experiments made on animals, using for their purpose those animals that were most susceptible to this particular disease. It was true that animals inoculated with tuberculous emulsion took the disease,

but the same material taken in the ordinary way through the alimentary canal often passed off without any injurious effects. Let them give these animals the tubercle in food which has been submitted to the same temperature as that the meat usually undergoes before being eaten by man, and he challenged the world to give a single instance of the disease being acquired in such circumstances. The Commission made some remark to the effect that the danger was greatly exaggerated, and the lecturer himself showed that this was so when he pointed out that from some abattoir in Germany only  $\frac{1}{2}$  per cent. of the animals were rejected as unfit for human food.

#### The Consumption of Meat

In London had increased enormously during recent years, but notwithstanding this the death rate had fallen enormously, too. The lecturer admitted that milk as well as meat communicated the disease, and also that it might be taken through the lungs. It was found that half the deaths from tuberculosis were of children under two years of age—before they would begin to eat meat—and that the period of greatest immunity from the disease was from five to fifteen years of age. Between the ages of fifteen and forty-five the nature of the disease changed entirely; it ceased to be intestinal, and attacked the respiratory organs, and, of course, eating meat had very little to do with the respiratory organs. Mr. Redman proceeded to refer to

#### The Case of Salisbury,

which, he said, was well known some time ago as a dreadful place for consumption. They proceeded to drain Salisbury, and in a little while the rate of consumption dropped as much as 50 per cent. There were other cases also where the death rate from consumption had been reduced by getting rid of the dampness of the soil. The provision of good housing accommodation and abundant ventilation also reduced the disease. And so he argued that of one hundred cases of consumption, ninety-nine were due to other causes, and only one to the eating of meat. Moreover, London had a lower death-rate from consumption than many towns which had spent half a million or a million on public abattoirs. Turning to the

#### Financial Argument,

Mr. Redman declared that anything could be made to pay. Supposing the charges at a particular abattoir for slaughtering, &c., amounted to 8s., and it was found at the end of the year there was a loss of £2000, the charge to the butcher would be raised to 10s., and then, of course, the thing would pay, and they could argue that public abattoirs were self-supporting. The butchers, as a trade, were not frightened of inspection, they welcomed it, for their meat—especially in London—was the best in the world; but until it was proved that their meat was disseminating disease they were not prepared to accept the system of public abattoirs.

#### Medical Arguments.

Dr. Glover Lyon contended that the last speaker had given no reason whatever why they should not have public abattoirs. For he had not disproved anything that Dr. Bond had said. He agreed that we should take care not to exaggerate the danger; the position they should take up was this: there is a danger and if it can be so easily got over as by public abattoirs, that method should be adopted. He thought there should be no need of compulsion, as it would be to the butcher's interest to use the public abattoir. A large dairy firm sent round circulars stating that all their milk was taken from fully inspected cows. The butcher who made it known that his meat was killed at a public abattoir, where it was thoroughly inspected, would gain a great deal over a man who slaughtered his beasts in private houses. It was of great importance that the public should be properly informed as to the production of tuberculosis. As Dr. Bond rightly said, it was produced by the entrance into the body of the tubercle

bacillus, and its growth there. Mr. Nicholson, an agricultural engineer, caused some amusement by his vigorous denunciation of these "atrocious institutions." His remarks were only partially audible at the reporters' table, but his objections appeared to be on the ground that a public abattoir involved great cruelty to the animals, and also great waste, as bullock's blood was a most valuable manure.—Mr. Coggan pointed out that emaciated animals did not come into the slaughter houses of London. The diseased animals mentioned in Dr. Bond's paper were old cows not averaging more than 350lb. each; such beasts did not come into the London slaughter-houses.

#### Railway Companies and Diseased Cattle.

Mr. H. Shaw said that although diseased cattle were not killed in private slaughter-houses they did come into London, chiefly to the cattle market at Islington. The railway companies should be compelled not to take cattle that were diseased. Professor Hunting, F.R.C.V.S., said the worst case of tuberculosis he ever saw was killed and distributed from a private slaughter-house in Chelsea. Twenty per cent. of the milch cows in London were tuberculous. What became of them? Most of them slipped through the private slaughter-houses. He suggested that butchers ought to be compensated for the destruction of tuberculous animals, and that the farmer who distributes the diseased cattle should be dealt with, as well as the butcher.

#### Meeting the Butcher Half-way.

Mr. James Lemon thought that something should be done to meet the objections of butchers to public slaughter-houses. One of their objections was that the killing of cattle in a large hall was a barbarous system. He had seen cattle killed at Liverpool; the animals were knocked down one after another, they were all of a tremble, and a more disgusting and villainous thing he never saw in his life. There was no reason why they should not have a house, as in Manchester, which the butcher could open and use in the same way as in the case of a private slaughter-house, but which would be open to public inspection. The private slaughter-houses were often quite unsuited for their purpose, being merely converted stables. They would not get public slaughter-houses until they came to a more reasonable frame of mind in reference to the butcher. They ought to put up a building to which the butcher would go voluntarily, and if they did that the private slaughter-house would soon disappear. It was possible to erect a good house without having to charge the butcher more than he now pays for a wretched private slaughter-house.

#### Views of the R.S.P.C.A.

Mr. John Colam, Secretary of the Royal Society for the Prevention of Cruelty to Animals, entirely concurred with what had been said as to the immense superiority of slaughter-houses on the Continent. From the point of view of his Society the great evil of the present system was that the private slaughter-house was private ground, and the inspector could not enter without permission. The public slaughter-house would be open to public inspection, and there would be less possibility of cruelty.—In the course of a somewhat lengthy reply, Dr. Bond touched upon most of the points raised by the various speakers. To Mr. Redman's objection, that particularly susceptible animals were chosen for experiments, he pointed out that many human beings were particularly susceptible to the disease. He did not, of course, deny that there were many causes of consumption, but the eating of tuberculous food was one.—The Chairman, in the course of a short speech, alluded to the difficulty of deciding whether a beast was diseased without examining the entrails. He related the case of a member of the L.C.C.—a member of the butcher's trade—who had passed a cow as being in perfect health, but admitted when he saw the entrails that he had never seen a cow so infected in his life. In a public abattoir thorough inspection of every part would be assured.

## THE PLASTERERS' LOCK-OUT.

THE lock-out which began on the 6th is proceeding in a very leisurely way. It has not yet affected so large a number of men as might have been expected, nor has it brought us any nearer to a settlement of the dispute. From the returns of the number of men locked out in London and the Provinces, received at the head offices of the Plasterers' Association, it appears that about 2400 members of the Union have been affected. Of this number at least 700 had found work in other directions, so that only about 1700 last week received strike pay. The men received 15s. and the apprentices 8s. The men who remain in work will, from this week, contribute a special strike levy of 3s.

The Secretary of the Master Builders' Association states that his Committee are very well satisfied with the results so far. A number of sub-committees have been appointed to deal with the lock-out.

Mr. Deller has issued a circular to the members of the Plasterers' Association, giving the text of his correspondence with Mr. Hassall, the masters' Secretary. Mr. Deller proceeds in his circular to review the masters' demands *seriatim*. With regard to the question of the limitation of apprentices, he states that the Secretary of the Central Association of Master Builders, in his report presented to their meeting at St. Martin's Town Hall on February 23rd, charges them with not availing themselves of the services of apprentices to anything like the extent to which trade unions assent. On the charge of refusal to work on buildings where some of the workmen employed may not belong to a trade union, Mr. Deller says there might be produced instances where individuals had done so without the consent of their branches or the executive committee, but he claimed that an association could not as a whole be blamed for what might happen without its consent. On the subject of submitting trade disputes to a conference, the men's secretary says:—"This question the National Association of Master Builders have settled themselves in a manner not only discreditable to them, but showing clearly that it is not we, but they, who will not meet in conference." Mr. Deller concludes by advising his members to work honourably for any employer who is willing to carry out the local rules.

Mr. Hassall, the secretary to the Master Builders' Association, has addressed a letter to Mr. Deller, in which he complains that, beyond a formal acknowledgment, his letters seem to be ignored by the Plasterers' Association. He then repeats that his association is willing to meet the Plasterers' Association in conference as soon as the latter body send alternative proposals in writing. He adds, with reference to the last paragraph of Mr. Deller's letter (which appeared in our columns last week):—"I may state that there is not the slightest foundation for your statements that my association desire your annihilation, or that no reliance can be placed on any settlement being honourably carried out so far as my association is concerned. Such remarks are not only unnecessary and offensive, but also absolutely untrue."

The support accorded to the policy of the National Association of Master Builders by the builders of the provinces evidently varies in different localities. In many places the lock-out is being enforced, but in others work is being carried on as usual.

At a meeting of the Scarborough Master Builders' Association for instance, it was decided to take no part in the dispute. It was stated that the grievances against which the Master Builders' National Association are contending do not exist in Scarborough. The Works Department of the London County Council, although appealed to for their support by the Master Builders' Association, maintains a strictly neutral attitude. It is stated that a large London firm which originally joined the lock-out have restarted their men. On the other hand reports of fresh

adhesions to the lock-out on the part of provincial employers are being constantly received.

A possible new development is the starting of work by the operative plasterers themselves on co-operative lines. The idea is being considered, but it is extremely doubtful whether it will be practically realised. The Brussels correspondent of an evening paper states that advertisements are appearing in Belgian newspapers offering permanent employment at good wages to plasterers willing to go to England. The wages of plasterers in Antwerp and Brussels vary from 5d. to 6d. per hour. No mention is made in the advertisements of any dispute in England, but the news has already been sent round to the various Unions in Belgium. A few Dutch plasterers are said to have been already brought over and engaged by an Oxford Street firm.

Mr. J. A. Hassall, the secretary of the National Association of Master Builders, has forwarded to Mr. Deller a series of extracts from the monthly reports of the Plasterers' Union, which, he claims, show that Mr. Deller's reply to the employers' letter of February 1st is not accurate.

Mr. Dellar formally replied to this letter, acknowledging its receipt and refusing to discuss certain matters with Mr. Hassall, as they were private and only concerned the Central Executive and their branches.

## Surveying and Sanitary Notes.

**The Eastbourne Town Council** has made an application to the Local Government Board for sanction to borrow the sum of £5000 for street improvements.

**Paving Kew Bridge.**—In a letter to the "Morning Post," "R.D." advocates wood-paving for Kew Bridge, as, no matter how much gravel is thrown on to stone roads, horses slip on them, and the strain of such slips, and the after consequences are, he says, only too well known to the owners of horses.

**The Burslem Town Council** is going to apply to the Local Government Board for permission to borrow £2800 for paving Newcastle Street, and £150 for paving Chapel Bank. A recommendation of the Joint Hospital Committee to further consider the question of enlarging the sanatorium before coming to a final decision was approved.

**Sheffield Street Improvements.**—The Improvement Committee of Sheffield City Council have agreed to purchase 1024 square yards of land with the salesshops and buildings thereon in Neepsend Lane, at a cost of £4500, for the purpose of widening the Lane. Also, in consideration of Church Burgesses giving up 400 square yards of land in Coleridge Road, near the canal bridge, in order to widen the same to 40ft., they have agreed to execute the necessary street works at an estimated cost of £200.

### Examinations for Sanitary Inspectors.

—In answer to a question in the House of Commons last Thursday week, Mr. Chaplin said that an association has been formed, with the concurrence of the Local Government Board, for holding examinations of persons desirous of obtaining certificates of competency for the office of sanitary inspector or inspector of nuisances. The association has been registered as a company with limited liability. One of the objects of the association is to prescribe such course of study and technical training as may be calculated to ensure the fitness of persons desirous of qualifying for the offices above mentioned. Several bodies, some of whom provide instruction for those who desire to become sanitary inspectors, will be represented on the examination board, and representatives may be elected by such additional bodies as may from time to time be approved by the Local Government Board.

## Masters and Men.

**The Annan painters have struck** for  $\frac{1}{2}$ d. per hour rise on their present wage, which is 6 $\frac{1}{2}$ d.

**The Scottish Masons** have consented to continue for another year the existing agreement with the masters as to hours and wages.

**Advance of Wages in the Chain Trade.**—All the employers in the South Staffordshire and North Worcestershire districts have granted an increase of ten per cent. in wages to their operatives engaged in the manufacture of small chains.

**The Keith Masons' Strike.**—The master masons, by request of the men, met in conference on March 6, three representatives of the operatives and two delegates from the Operatives' Union, Glasgow, and it was agreed that the masters, having at present contracts for dressed stones from Auchindor Quarries, be allowed to finish the jobs for which they had contracted; but after they are finished all stones required for future jobs are to be dressed on the ground at the job.

**Workmen's Compensation Act: A Widow's Claim.**—On the 5th March, Lords Justices A. L. Smith, Collins, and Romer, in the Court of Appeal, heard the case under the Workmen's Compensation Act (1897), of *McNicholas v. R. F. Dawson and Sons*. Mrs. McNicholas, a widow, appealed from the decision of the County Court judge of Bradford, who decided that her husband had not met with his death under circumstances that entitled her to compensation under the Act. It seems that the man was engaged to look after a steam engine, and also had to attend to a mortar tank which the engine worked. This tank was outside the engine shed, and adjoined it. A few minutes after the steam had been turned on on the morning the accident occurred, a labourer saw the deceased being whirled round on the engine shaft. Besides the door which gave access to the shed, there was a small door at the opposite end. To get at it a man would have to pass under the engine shaft, which could only be done by crouching down. It was the deceased's duty after setting the machinery to work, to go outside the shed and attend to the filling of the mortar tank; and strict orders had been given, according to the defendants' foreman, that the men were never to use the little door when "steam was on." The defendants' counsel stated that the man must have attempted to leave by this door, and said that it was absolutely uncertain whether the accident to McNicholas "arose in or out of the work" that he was employed by the firm to do. They had got a judgment, and it was for the appellant to show by evidence of some sort that the learned County Court judge was wrong in deciding that there was not sufficient evidence to show what the unfortunate man was actually doing when he got entangled with the machinery. The learned counsel then argued that the work the man was engaged on was not work "on or about a building," and relied on the fact that the steam engine was in a low shed that did not come within the definition of "a factory."—Lord Justice A. L. Smith said there could be no doubt that if anyone were asked to say whether or no the deceased man met with his death by an accident arising out of or in the course of his employment with the defendants the answer would be "Yes?" The respondents had attempted to get out of their liability by saying that this was not a "factory," and that the man might have been attempting to leave the shed by the little door for his own purposes. The County Court judge did not find that the man had gone to the little door "for his own pleasure." The appeal would be allowed.—Lords Justices Collins and Romer delivered judgments to a like effect.

Builders' Notes.

Engineering Notes.

**A Kiln Collapsed** at Mr. Forder's cement works at Sundon, near Luton, on Monday, last week. One man was killed, and two others severely injured.

**Moss Vale School, Paisley** (Mr. John Hutcheson, of Glasgow, Architect), is to be ventilated by "Cousland's Improved Climax" patent direct-acting invisible roof ventilators, supplied by the "Climax" Ventilating and Heating Co. Ltd., of Glasgow.

**A New Cement Company.**—The Lyme Regis Cement Company, Limited, has been formed with a capital of £75,000 in £1 shares, to acquire a property at Lyme Regis containing a supply of limestone, for use in the making of Portland cement. The vendor has fixed the purchase price of the business at £25,000, and out of the issue of £50,000 there will be working capital of £25,000 provided.

**A Builder v. the Magistrates of Aberdeen.**—In the Second Division of the Court of Session of Scotland before the Lord Justice Clerk, Lord Young, and Lord Frayner, judgment was given in a reclaiming note for the pursuer in an action by James Russell, builder, Aberdeen, against the Corporation of Aberdeen. The pursuer sought a declaration that he was entitled to build walls to a greater height than 7ft, on the north side of Broomhill Road, provided they were not nearer the present centre of the road than 18ft.; or, alternatively, that they were not nearer than 25ft.. The defenders maintained that, under their Police

Acts, they were entitled to require the pursuer not to build within 25ft. of the old centre of the road. Lord Low, in the Outer House, was of opinion that the defenders were entitled to require the pursuer to keep back his buildings to a distance of 25ft. from the centre of the existing road. The question of expenses was reserved. In the Second Division their lordships—Lord Trayner dissenting—affirmed the decision, with expenses.

**The death of Mr. Robert Neill** took place at his residence in Higher Broughton, Manchester, on Sunday, March 5th. He was born in 1817, and was first engaged in Manchester in the workshop of a well-known joiner and builder in Strangeways. After occupying the position of foreman for some time, he began business on his own account in 1842. Mr. Neill erected the Manchester Jubilee Exhibition of 1887. In 1866 he was elected Mayor of Manchester, and in 1888-9 he served as High Sheriff of the County of Rutland.

**New Brickworks at Newhey.**—The Newhey Brick and Terra Cotta Company Ltd., formed in April, 1898, to acquire from the Waterhead Land Company, which was then in liquidation, the brickworks at Newhey, has just started operations. There is a splendid bed of shale running under the whole of the Company's freehold land, which is about 28 acres in extent. Since taking possession the Company has removed the whole of the old buildings and machinery, and erected a new plant complete in every detail. Three brick-making machines have been fitted, and are at work. Two of them are each capable of turning out 5000 bricks per day, and the other makes 10,000 bricks during the same period.

**Municipalisation of Gasworks.**—The local authorities at Morecambe, Skipton, Kirkby Lonsdale, Littleborough, and Northwich, are seeking to take over the gas undertakings in their various districts.

**Refuse Destruction and Electric Lighting.**—The Hackney Vestry has resolved to spend just on £250,000 in the laying down of combined works of electricity supply and refuse destruction. The work will be executed by Mr. E. Hammond, of 64, Victoria Street, Westminster.

**Battersea to have Electric Lighting.**—The Vestry of Battersea have decided to instal the electric light throughout the parish at a cost of £102,000. Two hundred and forty arc lamps are to be erected throughout the principal thoroughfares, and power is to be provided for 24,000 wired eight-candle power lights. Fivepence-farthing per unit is the price suggested, though the Act allows a charge of eightpence; and it is anticipated that the total income resulting from the instalment will be £14,040. The cost of generating the current, of maintenance, repairs, and expenses of management, it is estimated, will come to about £8500. A site for the erection of a central station at a cost of £42,000 has already been secured, and the scheme is to be proceeded with at once. The machinery employed will also be such as will easily lend itself to the supply of power for electric tramways in the parish.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
March 17	Blaenau Festinieg, Wales—Alterations, &c., to Chapel	.....	Rev. R. R. Morris, Brŷngraig.

Property and Land Sales.

**EAST PARADE CHAPEL ESTATE, LEEDS.**  
This important Freehold Property offers singular facilities for professional and commercial purposes, as the present building is capable of conversion into a business emporium, but disregarding it, the site presents an almost unrivalled opportunity for the erection of a magnificent building suitable for **INSURANCE and PROFESSIONAL OFFICES.**  
The frontage to East Parade is 83ft., to Greek-street 133ft., and to Russell-street 134ft.  
The **INCLOSED AREA** is about **1265 SQUARE YARDS.**  
East Parade is the main avenue from the railway stations to the Town-hall (in which are the Assize Courts), the Municipal Buildings, the Poor Law and School Board Offices, the Fine Art Gallery, and Free Library.  
It is close to all the chief banking establishments, near to the Royal Exchange, and in the midst of the professional business of the city.  
Any insurance or other company seeking a site in a commanding position of increasing value cannot find one offering so many advantages as this property, at the price which the vendors are willing to accept; consequently this sale is one of special interest, and one which ought to command unusual attention.  
The widening of Infirmary-street, which leads direct from City-square to the Town Hall, will greatly enhance the value of this property, and other improvements likely to occur in the vicinity, will largely increase the demand for office accommodation, for which this site is extraordinarily suitable.  
**MESSRS. HEPPER and SONS** are instructed by the Trustees to **SELL by AUCTION**, in their Estate Sale Rooms, East Parade, at 4 p.m. on Tuesday, March 21st, subject to conditions. The above highly important **FREEHOLD PROPERTY.** Plans, particulars, and conditions of sale are being prepared, and may be had fourteen days before the sale, of the **AUCTIONEERS**, or of **Messrs. SCATCHELD, HOPKINS, and MIDDLEBROOKS**, Solicitors, Prudential-buildings, Park-row, Leeds, and Morley.  
**To Syndicates, Builders, and Speculators.—Chelsea.—**A magnificent Building Site of 24,000 super. feet.  
**MESSRS. ROBINS, SNELL, and CO.** have received instructions from the Wilkinson Sword Co. Ltd. (in consequence of the removal of their works to more extensive premises) to **LET by AUCTION**, at the **MART, City**, on **TUESDAY, MARCH 28th** next, the valuable **FREEHOLD SITE** now occupied by the Company's works, and admirably adapted for the erection of a handsome block of flats, a theatre, or other purposes requiring a large area in a leading thoroughfare. The site has frontages of 109ft. to King's-road and 250ft. to Sydney-street, and contains an area of about 24,000 square feet.  
Particulars, plans, and conditions of sale from the Solicitors, **Messrs. CRUSEMANN and ROUSE**, 85, Gracechurch-street, E.C.; and at the **Mart**; and from the Auctioneers, **Messrs. ROBINS, SNELL, and Co.**, 22, Conduit-street, Bond-street, W.  
**Forest Hill, S.E., close to station.**  
**MESSRS. EASTMAN BROTHERS** will **SELL**, at the **MART, E.C.**, on Tuesday, March 21st, at Two, a valuable **FREEHOLD BUILDING ESTATE**, 6 acres, with frontages to Devonshire-road, Honor Oak-road, and Manor-road, ripe for erection of villas, or a portion offers a fine site for an institution.  
Particulars of **Messrs. WONTNER and SONS**, Solicitors, 19, Ludgate-hill, E.C.; and of the **AUCTIONEERS**, 23, Bucklersbury, E.C., and at **Forest Hill, S.E.**  
**FAIRMILE PARK, near Cobham, Surrey.—A FREEHOLD BUILDING ESTATE** of about 40 acres, with possession.  
**MESSRS. DRIVER and CO.** have received instructions to offer to **AUCTION** at the **MART, Tokenhouse-yard, Lothbury, NEXT SPRING** (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairmile Station, and about a mile and a half from Cobham Station. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) possessing charming views over the intervening country to Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and will be included in the sale as a "going concern."  
Particulars and plans, when ready, can be obtained of **CHARLES JUPP, Esq., Solicitor**, 48, Lime-street, E.C.; and of **Messrs. DRIVER and Co.**, 23, Pall Mall, S.W.  
**By order of Trustees.—Preliminary Advertisement.—**Freehold Building Estate, Streatham, near West Norwood Railway Station.  
**MESSRS. FIELD and SONS, and Messrs. WOLFORD and WILSHIN**, who are jointly concerned, will **SELL by AUCTION**, at the **MART**, at an early date, a valuable **FREEHOLD BUILDING ESTATE**, known as **High View Park**, comprising 16a. 1r. 10p., lying immediately at the rear of and with approach from Leigham Court-road; also a contiguous Freehold Building Site of 2a. and 5p. in a new road intended to connect Canterbury-grove with Thurlby-road.  
Particulars and plan, in due course, of **Messrs. KINGSFORD, DORMAN, and Co.**, Solicitors, 23, Essex-street, Strand; of **Messrs. WOLFORD and WILSHIN**, Auctioneers, Anerley, S.E.; and of **Messrs. FIELD and SONS**, as above.

**SANITARY INSPECTORS' EXAMINATIONS.**—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E. 9

**ANSELL and MALLOWS, Architectural**  
Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C. 1

**R. I. B. A. EXAMS. PREPARATION,**  
personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to **Messrs. HOWGATE and BOND, Associates R.I.B.A.**, Perchard House, 70, Gower-street, W.C. (close to the British Museum)

**R. I. B. A., SOCIETY OF ARCHITECTS, and**  
CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, in residence, or personally.—**MIDDLETON and CARDEN**, 19, Craven-street, Strand, W.C.

**TO ARCHITECTS, UPHOLSTERERS, and**  
Trade generally. DECORATIONS in any style. Reasonable terms. Town or country.—**HATHERLEY**, 40, Great Pulteney-street, W. 2

**FOR SALE, 64 VENETIAN BLINDS, 2ft.**  
Sin. by 4ft. 11in., of best selected Pine; best drab tapes and lines; fitted with Beaumont's Patent Action. No reasonable offer refused.—Apply "Housekeeper," 23, Crutched Friars, E.C. 2

**APPOINTMENTS VACANT.**  
The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**LONDON COUNTY COUNCIL.—Compe-**  
tent **ARCHITECTURAL ASSISTANT RE-**  
QUIRED. Commencing salary, £2 12s. 6d. a week.—Forms of application can be obtained from the ARCHITECT to the COUNCIL (Housing Branch), 17, Pall Mall East, S.W. 1

**BUILDER'S CLERK WANTED.** Must have knowledge of drawing.—Apply, stating age, experience, and salary expected, Box 998, BUILDERS' JOURNAL Office. 1

**WANTED, energetic and experienced**  
REPRESENTATIVE in the London and Provincial wall-paper trade. Must have good connection, and be personally well known to the principal decorators and upholsterers. Good correspondent; well educated and capable man of business; pleasing address and gentlemanly appearance. One who has represented a wholesale house or firm of manufacturers preferred. Liberal salary and commission to first-class man.—Apply, stating age, experience, full particulars, and salary expected, by letter, to "A B C," Street Brothers, 5, Serle-street, W.C. 1

**APPOINTMENTS WANTED.**  
The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**YOUNG ARCHITECT, A.R.I.B.A.,**  
ASSISTS in the  
PREPARATION OF DRAWINGS, TRACINGS, &c.,  
at his own Office.  
**G. SCORER**, 23, Newman-street, W.

**QUANTITIES** prepared, specifications written, works measured, and variations adjusted by reliable London Surveyor. Over twenty years' experience. Special terms by arrangement.—"Surveyor," office of the BUILDERS' JOURNAL. 42

**ESTATE MANAGER (35)** desires RE-  
ENGAGEMENT, town or country. First-class testimonials; good manager of men and work; experienced in building, specifications, quantities, drawings, measuring up, &c.—Box 1005, BUILDERS' JOURNAL Office. 3

**EXPERIENCED ASSISTANCE** given at

## An Architectural Causerie.

The Art Teaching  
of William  
Morris.

*I know by experience  
that the making of de-  
sign after design—  
mere diagrams, mind*

*you—without oneself executing them is a  
great strain upon the mind. It is neces-  
sary, unless all workmen of all grades are to  
be permanently degraded into machines, that  
the hand should rest the mind as well as  
the mind the hand.*—"Art and the Beauty  
of the Earth," being the text of a lecture  
delivered by William Morris in Burslem  
Town Hall, October 13th, 1881.

The first of what promises to be a most  
delightful series of booklets was made the  
subject of an article published in our columns  
some months ago. The second is no less  
desirable, and we are glad to note that there  
are more to come. Of the worth of this  
unstudied deliverance there is no need to  
speak at all fully, our object being merely to  
say that its moderate price brings the work  
within reach of us all. When we spoke in  
our haste of the awful expense of the printed  
books he produced we should have enquired  
"what of their cost to him?" He neither  
asked nor expected the millions to pay.  
Knowing well where the money was, it prob-  
ably amused him to think that, merely to be  
in the fashion, the people who wasted the  
most would help him to give us a lesson.  
It is pleasant to think that his miscellaneous  
writings and sayings may be recovered and  
issued in the form of the books we are prais-  
ing. Whoever collects these reprints should  
notice their dates, and range them accord-  
ingly, for within our recollection there have  
been remarkable changes in the intellectual  
world, and every such change, or indication  
of change, was reflected in Morris's mind.  
In his earlier days, if we may take him at his  
word, he was a mere fatalist, seeing evil  
enough and to spare, but no way of escaping  
therefrom; at any rate no way of bettering  
matters by talking. But while singing of  
"Empty days," and, as if to show what  
could be, he gathered around him workers  
who knew nothing of idleness, and desisted  
only when bidden by Nature. Are we to  
suppose he was not thinking the while, seeing  
where his heart was, and what he had to  
contend with? We are, at any rate, sure  
that there was never a shrewder observer,  
and that he noted as tending to better or  
worsen his work whatever went on in the  
world. He had, as his eulogist says, "an  
instinctive perception of right" which put  
him ahead of his times, and naturally made  
him impatient, not so much with the people  
about him, as with their roundabout ways of  
reaching a point. The change of which we  
have spoken has pretty well revolutionised  
thought, and affected all branches of know-  
ledge. There is evidence of it in Mill,  
and, where we might least expect it, in books  
which profess to facilitate the study of  
Architecture. The older economists were  
almost solely concerned with a set of ideas  
pertaining to the conception of a system  
supposed to be permanent, whereas we  
observe it to be moving, and are immensely  
excited about it. In Morris the change  
was complete; for he who had been despondent,  
finding all his pleasure in Art, and wishing

it might be shared, became conscious at once  
of a call to the outside world; was convinced  
that whatever was wrong could be altered,  
and that whoever could help should. The  
date of this lecture at Burslem, a town pro-  
ducing "more smoke than pottery," may  
account for the note of discontent being  
heard perhaps too often; but the date, as  
we said, marks an epoch, and in all his later  
discourses we hear more of his hopes than  
of his fears. E. R.

### The One Drop of Gall.

To all those—and they are  
many—who do not regard  
a large practice and a heavy  
balance at the bank, as the only aim and ideal  
of the architect, the position of many of our  
most successful practitioners presents an  
aspect not altogether devoid of a certain  
amount of pathos. After all is said and done,  
the deepest satisfaction that a man can get  
out of his life's work is,—after the approval of  
his own conscience,—the knowledge that he  
holds the respect and sympathy of his fellows.  
To many of those of high general talent, who  
have worked their way, by their energy and  
character, to a large practice, and a large  
measure of general practical success, even to  
the extent of impressing the Government and  
the public with a sense of their abilities,  
there must come moments when the thought

fessors should be men whose artistic gifts  
were not balanced by character and intellect.  
It is not exactly the calling for "the erotic,  
the neurotic, and the tommy-rotic." But, by  
the nature of things, it is evident that a call-  
ing which is first of all artistic—which has  
no reason for its existence, now-a-days, if it  
be not artistic—demands, first of all, some  
natural artistic gift. The practical question  
is, would it not be possible to discover  
whether the aspirant to artistic fame possesses  
this gift; to arrange that all those wishing  
to enter the profession should have their  
capabilities tested before being allowed to  
proceed further in a career for which they  
may be unfit. It is evident that if you wish to  
produce an architect, you must have the  
proper quality of raw material. You cannot  
make a silk purse out of a sow's ear. In the  
other plastic arts the same necessity hardly  
arises. The artistic faculty is well-nigh  
the only thing required, its cultivation  
is the one thing to which the student's  
attention is directed, and its fancied posses-  
sion was the one thing that decided his  
choice. If he possess it not, this is soon  
apparent to himself and every one else. He  
can at once retire from a career in which  
practical success would be difficult. But, in  
Architecture, how few adopt it because they  
think they have artistic powers; and, in the  
present day, the cultivation of the artistic

QUAINTON. (See p. 99.)

that they do not carry with them the applause  
and sympathy of their comrades, and those  
best qualified to judge—that they would never  
have obtained their positions by the vote of  
their colleagues—must rob this success of its  
greatest charm. How many able men, men  
of the highest talent and character, do we not  
find, completely out of their element as archi-  
tects? How many potential Lord Chan-  
cellors or Cabinet Ministers; men who, as  
administrators or as soldiers, might have  
earned the admiration of their country, or, as  
surgeons or scientists, might possibly have  
won the undying gratitude of humanity? As  
architects, this crowning glory is hope-  
lessly beyond their reach, for the artist's  
fame cannot be bestowed by any Government,  
it is not made by the public, but by his  
brother artists. It is not that high general  
talent, lofty character, and strength of pur-  
pose, are wasted in Architecture. Far from  
it. Architecture is a pursuit which emphatic-  
ally demands these qualities. But there  
must be added to them the one little gift, the  
instinct for art, for without this they are  
nothing worth. But neither would it be to  
the advantage of Architecture, that its pro-

faculty is well-nigh the last thing to which  
the student's attention is directed. He finds  
plenty to occupy his mind, plenty of scope  
for his energies, in mastering the practical  
side of his calling, to say nothing of the  
archaeological, the professional, or even the  
purely commercial. It is possible that,  
wrapt up in these pursuits, and succeeding  
well at them, many unimaginative men  
actually go through life quite unconscious  
that they lack the one thing needed to make  
them architects. Or if they do discover it,  
it is often too late; and seeing that practical  
success can be assured without an atom of  
artistic ability, well, high-flown sentiment is  
all very well in its way, but we have to make  
a living; why throw up a good opportunity,  
just because certain pedantic persons attach  
a restricted meaning to the word "Arch-  
itecture?" The pity of it is that there are  
better opportunities for such men in other  
pursuits, where a life of hard work and  
honest endeavour might meet with, not only  
the monetary reward, but also the reputation  
which is its due; where no such bitter  
flavour is found in the wine cup of success.

A.R.J.

## On Reflection.

### The Decoration of St. Paul's.

A GOOD many people are very angry with Sir W. B. Richmond for the manner in which he is decorating (or, as some prefer to say, desecrating) St. Paul's Cathedral. The criticism is not a new thing, but the latest developments of the work seem to have inspired a louder and more general outcry. Of recent critics perhaps the most extreme is Mr. Samuel Howe, of New York, who has contributed a strongly-worded letter to the "Times" on the subject, and followed it up with another in the "Pall Mall Gazette." We would not suggest that the decoration of St. Paul's is no concern of Mr. Howe's, for these great monuments of human genius belong not to a city or a nation, but to mankind. But we would point out that Mr. Howe's criticism defeats its own purpose owing to its lack of restraint. To speak of Sir W. B. Richmond's work as "an impertinence," and "a wretched business;" to hint at his "poverty of drawing," "limited knowledge of colours," and "ignorance of strong decorative problems;" to say that "the artist of St. Paul's decoration cannot draw;" to do all this is to abdicate the position of critic and come perilously near the border line which separates sober criticism from vulgar abuse. More sober, and therefore more effective, are the criticisms of the Earl of Wemyss, Mr. Lewis G. Fry, and others, and with these we confess to a large measure of sympathy. The decoration itself is not so much at fault; indeed, much of it, we think, is altogether excellent. Its great fault is that it does not harmonise with the architectural character of the cathedral, being more fitted for a Byzantine than a Renaissance building. It is certainly not the style of decoration Wren would have adopted, and that is in itself a grievous fault; without perfect loyalty to the spirit of the original design, any attempt to complete or restore a great work of Art becomes almost a sacrilege. It is true that Wren desired to use mosaic, but it is not conceivable that he would have done so in a manner that would have done violence to his own architectural conception. For the benefit of future generations the inscription over the north door should be amended. The "Si monumentum requiris, circumspice" is no longer applicable; there should be an addendum explaining in choice Latin that Sir Christopher had nothing to do with the mosaics and the paint.

### Harrogate and Its Pump Room.

THE Corporation of Harrogate recently invited designs for the erection of a new pump room, or, as an alternative, the enlargement of the present building. Mr. Pawson, of Leeds, was engaged as assessor, and the premiums, amounting in all to £160, were duly awarded. It now appears, however, that the Corporation intend to throw over all the competitive designs—fifty-six in number—and adopt instead one which the Borough Surveyor has had lying for some years past in a pigeon hole in his office. The Surveyor has been asked to submit this plan, with an estimate of the cost, to the next meeting of the Wells and Baths Committee. If the Committee had an eligible plan it is a pity they did not find it before spending £160 of the ratepayers' money, and inducing fifty or more architects to waste their time over a useless competition. It was pointed out at last week's meeting of the Corporation that the course proposed was not fair to the gentlemen who had competed, and one councillor went so far as to declare that the Committee were making themselves ridiculous in the eyes of the whole of England. Nevertheless, the

majority of the Corporation, unmoved by these considerations, adopted the recommendation of the Committee. Such tactics are not calculated to inspire respect for the fairness and judgment of the Harrogate Corporation, and may well deter architects, whose time is too valuable to compete for the mere chance of a premium, from entering the competition just advertised by the Corporation for a new Kursaal. When will town councillors begin to familiarise themselves with the elements of professional practice, and act towards architects with the same consideration and fairness they habitually—and rightly—display towards the tradesman and the mechanic?

### Secret Commissions.

THE Blue Book, just published by the Council of the London Chamber of Commerce, embodying the report of the Special Committee on Secret Commissions, is an astonishing revelation of the wide prevalence of systems of bribery in this country. Not only is trade paralyzed thereby, and a condition of commercial probity rendered to a large extent untenable, but the wider aspects of business and even the professions themselves are morally enervated by the payment of commissions, which, though of a secret and illicit and often fraudulent nature, have in many cases become a "custom." The story is an ugly one all through, whether we read of doctors who draw a commission of from 25 to 50 per cent. on the price charged by the chemist who dispenses their prescriptions, and who take a "discount" from the undertaker who buries their patients; or of the enginemen who accept the secret bribes which are paid them by the manufacturers of lubricating oil on a scale which tempts them to waste their employers' property and use the inferior commodity which brings the highest "discount" per gallon. Solicitors divide the stockbrokers' fees on investment for clients of trust or other funds and the accountants' fees in bankruptcy cases; while stockbrokers and bankers conform with the same usage, and the retention of secret profits by brokers on a sale of produce at an agreed rate of commission is at the present time grown to be a crying evil in the City. In workhouse and prison contracts bribery is rampant. With dealers, manufacturers, large shops, and stores bribery of the customers' servants is the rule rather than the exception; and in many lines of manufacture the system has become one of blackmail, when the refusal to pay secret discount to the buyer's agent is understood to mean the almost certain loss of the buyer. Morality in commerce is difficult to enforce, because it is almost impossible to define, and a most serious difficulty is in the way of any proposal to make the bribing of an agent, or his acceptance or solicitation of a bribe a criminal offence, in the fact that the public conscience is not roused to the immorality of the custom, but acquiesces in it. This has led people who may be considered to be well informed and competent judges of the matter to come to the conclusion that the mass of corruption is such as to render it hopeless to struggle towards purity, but the committee do not take this view of the matter. The committee recommend, in chief, that the principal should enforce vigorously towards his agent those civil rights which he now holds; that the matter should be brought by public discussion, and otherwise, before the people; and that manufacturers should openly state in their circulars that they pay no bribes.

### "Trade Commissions."

ARCHITECTS and engineers do not show in any very flattering guise in this report; the custom of paying secret commissions is notorious in the building trade, and architects

and engineers, although they cannot seriously defend the system, are yet widely implicated in it. The prevalence of the offence among architects is sufficiently demonstrated by those praiseworthy attempts which the more honourable members of the profession have taken to stamp it out. It is to the credit of architects that they are conscious of the smirch, and would have none included in the profession who are open to accept bribes, as is evinced in the signed declaration required of all candidates for election as Associates or Fellows of the R.I.B.A. At the same time the practice of its members is not in absolute conformity with the principles of the body. We may remember how, some four years ago, a printed circular was sent by some enterprising firm of manufacturers to London architects whose names and addresses had, it would seem, all been obtained from the Institute calendar, and we may remember the hypersensitiveness with which the late secretary referred to the episode in the Institute journal, adding a self-congratulatory comment to the effect that of course no member of the Institute would respond to such an invitation. Perhaps this comment was not altogether as tactless as at first seemed, for Sir Edward Fry in his second letter to the "Times," on the subject of Secret Commissions, in 1896, was in a position to speak plainly on this matter. "As to the Architect," he wrote, "the Secretary of the Royal Institute of British Architects has abundantly confirmed what I said as to the existence of the above, and of the regret with which it is viewed by the more honourable members of the profession. But I cannot accept his invitation to turn my attention 'more exclusively' to those architects who are not members of the Institute, when that body contains, according to the secretary, members whose 'moral fault' has been apparent."

## AN ARCHITECT WANTED.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I am wanting a really artistic architect to design me a house, medium sized, on a very picturesque spot in the country. Can you give me any advice as to a suitable architect? I want a house long and low with a large square entrance hall, to be used as a comfortable sitting-room, a wide staircase and a gallery going partly round hall, a dining-room and boudoir for a lady, about six bedrooms, and three servants' rooms, with comfortable offices, &c. I want something little unusual, either dark stained wood and thatch, or whitewashed brick, old timbers thatch, and all kinds of angles and windows. Will you tell me whom you advise my applying to?—Yours truly, B. L.

[We shall be pleased to receive communications from any architects who may be disposed to offer their services to our correspondent.—Ed. B. J.]

**To Erect a Refuse Destructor** the Plymouth Town Council desire to borrow £9000, and are applying to the Local Government Board for sanction to do so.

**Proposed Pier for Fleetwood.**—The promoters of the Fleetwood Pier Company are endeavouring to obtain permission to construct an open pier at Fleetwood, to extend 430 yards from the Fielden Esplanade. The estimated cost of the work is £43,390, and power is sought to borrow money not exceeding one-third of the paid-up capital. Objections have been raised to the undertaking by the Lancashire and Yorkshire Railway, the London and North-Western Railway, and the Urban District Council of Fleetwood.

# THE GREAT CENTRAL RAILWAY.

## DESCRIPTION OF THE ROUTE TO LONDON.

BY CHARLES G. HARPER.

**A**LTHOUGH the geographical features of the country through which it passes have not presented any great engineering problems in the making of the Great Central Railway, there have been many difficulties to contend with at certain points, caused chiefly by the necessity of driving the new line in places through densely populated districts. The new extension, commences at Annesley Junction, some ten miles north of Nottingham, and it is here, on entering the northern outskirts of that populous city, that the costly and delicate engineering works began. Running over a long brick viaduct at Bulwell, constructed of the unlovely, but hard and enduring, blue "Staffordshire brindles," of which all the Great Central brickwork (excepting the stations) is composed, we come to the Sherwood Rise tunnel, of six hundred yards' length, pierced through the heights on which the suburban residential districts of Nottingham are situated. At the southern end of this tunnel is Carrington Station, succeeded by another tunnel, three-quarters of a mile long, which leads directly into the great "Nottingham Central" station, built jointly by the Great Central and the Great Northern. This fine station covers a site of over twelve acres, formerly covered with the densest and poorest population in Nottingham,

CHARWELTON: FIRST BRIDGE OVER THE CHERWELL.

crowded into insanitary hovels of the worst description. As its name implies, the situation is central, and it is easily reached from the principal business streets.

A peculiarity of Nottingham is that the ground on which it is built consists of a soft yellow sandstone. Through this the Great Central engineers have had to pierce their tunnels under peculiarly difficult conditions. To adopt the well-known "cut-and-cover" system would have been so costly as to be practically prohibitive, taking into consideration the highly valuable nature of the property under which the line goes southward from the Central Station to the River Trent. The very heart of the city is thus traversed, and had that system been adopted, this portion of the Great Central would have been as costly as the famous completion of the Circle in the City of London, between Mansion House and Aldgate, which was made at the rate of two millions sterling a mile. Banks, insurance offices, warehouses, and factories of the largest kind would have had to be pulled down and rebuilt, and compensation claims would have filled the law courts with business for years. The company adopted a system of the most elaborate underpinning instead, itself a costly and most delicate resort in this instance, for not only were the buildings to be underpinned of great weight, but the tunnel had to be constructed so near the surface that in several instances the crown of the arch cuts through the cellars and basements of hotels and factories, and here and there the tunnel has had, for the same reason, to be made with an arch so low as to only just clear the funnels of the locomotives. The engineers tell a weird story

of how the basement strong-room of a bank was cut through, its floor removed, and replaced by the tunnel arch. This difficult tunnelling was completed, however, without the slightest displacement of the buildings above. At the southern end of this last Nottingham tunnel the ground begins to fall sharply towards the River Trent. There is a station for Arkwright Street, and then the Trent is crossed in three spans of lattice steel girders, of 110ft. width, with four lines of rails. Thence the country becomes easy, past East Leake, Ruddington, Loughborough, "Quorndon and Woodhouse" stations, and, indeed, remains so to within a mile of Leicester. The country is pretty at Quorndon, which is the district of the famous Quorn Hunt; and the prettiest piece of scenery along the whole route to London is to be found just before reaching Leicester, at a point near Swithland, where the railway crosses the great Leicester reservoirs on a brick viaduct. Here the line skirts Charnwood Forest, and here, at Mount Sorrel and Groby, granite is quarried; the only place in the Midlands where that is found. The railway approaches Leicester by way of "Belgrave and Birstall," and comes along a tall viaduct into the Leicester high-level station, and so to the great Abbey Lane coal sidings.

Viaducts of brick or steel characterise the Great Central throughout Leicester and for some distance southward, as it makes for Whetstone, Ashby Magna and Lutterworth, coming eventually to Rugby.

Rugby is a singular place. The town, whose prosperity is probably caused in equal moieties by the famous school and by the long-existing railway facilities of what Dickens called "Mugby" Junction, is a considerable distance from the different stations. Once, in the old coaching days, an obscure hamlet, to which letters were addressed "Rugby, near Dunchurch," the cynicism of Fate has, since railways ousted the coaches, caused the old township of Dunchurch to decay, and Rugby to flourish, so that "Dunchurch near Rugby" is the modern formula. Possibly the near neighbourhood of the Great Central will render Dunchurch a service. It stands at present, a picturesque village, on the Holyhead Road, with the village cross, stocks, and "lock-up," a complete picture of the England of a hundred years ago.

South of Rugby there are some heavy works on the new line; the Willoughby cutting, two miles long, and the Catesby Tunnel, near Charwelton, of 3000 yards, together with several brick viaducts, making this an interesting section. At Woodford there are big engine sheds and sidings for coals. "Charwelton" is the wayside station for the village of that name, which marks the rise of the little River Cherwell, flowing thence to its junction

with the Thames at Oxford. The village, with its ancient stone bridge over the infant stream, often dry in summer, is a picturesque spot. At Byfield there is a junction line to Banbury now in progress, and from the Great Central near Brackley one obtains a passing glimpse of Sulgrave crowning the ridge of an upland. All good Americans go (or ought to go) to Sulgrave, for, if not a village of any

SULGRAVE.

great beauty, it is of strong historic interest, for here still stands the farmhouse which was the ancestral home of that branch of the Washington family from which descended the great George, the founder of the United States of North America. The church has memorials of bygone Washingtons in it.

Now we come, past the small wayside station of Fimmere and Calvert, to the junction with the Metropolitan Railway, at Quainton Road, a station a mile and a half from the pretty, old-world Buckinghamshire village of Quainton, with its village green, village cross, and great windmill, backed by tall trees, for all the world like one of those picturesque places which the lamented Rand lph Caldecott was wont to imagine.

From this point the Great Central has running powers over the Metropolitan line as far as West Hampstead, where the short London section begins.

The Sailors' Institute at Bilbao was opened on March 4th. The cost of the site and building amounts to £2000.

The Cost of Cheddleton Asylum, Staffordshire, was estimated at £187,250, of which £164,250 was the estimated cost of buildings, drains, &c. The contract entered into for the latter items was £865 in excess of the estimate, and the committee dealing with the matter are now applying to the Local Government Board for sanction to borrow an additional £35,000 to complete the buildings. The increased expenditure, it was stated, was necessitated by alterations in the drains, the lighting of the buildings, making the roads, and disposing of sewage.

CCNARER

DUNCHURCH.

## THE ARCHITECTURAL ASSOCIATION.

### REFLECTIONS ON THE ENGLISH RENAISSANCE.

By REGINALD T. BLOMFIELD.

THE ordinary meeting of this association took place last Friday evening, March 17th, at 9, Conduit Street, Mr. G. H. Fellowes Prynne in the chair. The minutes of the previous meeting were read and confirmed, and a vote of thanks was accorded to Col. Edis for conducting members of the association at their last spring visit on March 11th to the Central Railway Hotel, Marylebone Road, and also to Mr. E. Wragge, who conducted them over the Great Central Railway Station adjoining. The next spring visit was announced to take place at the Fire Testing Station of the British Fire Prevention Committee at North Bank, Regents Park, W., the nearest railway station to which is St. John's Wood. The president, Mr. G. H. Fellowes Prynne, announced that the association's common room will be opened on Monday, March 20th, at 5 p.m. The following classes were announced: On March 22nd, Mr. J. H. Leaning will lecture, at 6.30 p.m., on "Quantity Surveying," and on April 12th, Prof. Henry Adams, at 6 p.m., on "Land Surveying."

The president then called on Mr. Reginald Blomfield to read his paper on "Certain Reflections on the English Renaissance." The paper was as follows:

The English Renaissance is a subject which, historically treated, would be quite beyond the scope of a single lecture. I propose, therefore, to call your attention to certain aspects of this chapter in history, and to endeavour by this means to disentangle some clue to guide us through the perplexities of modern architecture. Any conclusions which I may offer you, however I may express them, I offer with great diffidence. The present condition of Architecture is so unsatisfactory, and so beset with difficulties, both in theory and in practice, that the most one can hope to attain to is some firm foothold on the facts of history—a foothold from which we can start again with at least a glimmering of an idea of the goal at which we aim. For in Architecture, the oldest of the arts, we can only consider ourselves on safe ground so long as we keep in touch with what has actually been. You may recollect the words that Viollet-le-Duc used nearly forty years ago: "If art has lost its way, let us not impel it to the right or to the left under pretence of conducting it into the true path. . . . The study and love of art—not of one form of art—are the only means to which the wise will recur when art seems to decline." It is only by patient and critical study that we can hope to retrace our path to the highway of Architecture.

#### The Earlier and Later Renaissance.

A comparison has been made between the Renaissance of the sixteenth and seventeenth centuries in England, and that of the nineteenth century (assuming, of course, that the latter exists). In order to test the worth of any such comparisons it is necessary to consider for an instant what that great Renaissance was of which our own sixteenth and early seventeenth century Architecture was but a distant echo. There are two points about this movement which differentiate it from any others in the history of art. The Architecture of the ancient world was one long continuous progression from its dim beginnings in the East till its disappearance with the downfall of the Roman Empire. There was no break in the Hieratic Art of Egypt and Assyria. This, again, only developed into a freer and more perfect expression in the hands of the Greek, to be adopted by the Romans, and wrought by them into the full expression of their own magnificent genius. Architecture might flourish in one place more than another, but throughout its long history there was no break in its continuity. Its historical development went straight ahead, with no throw-back to earlier art till its vitality dwindled, and it died out with

the decaying forces of Roman civilisation. There was a curious objectivity about the ancient world which prevented any intense reflection of its life and thought on its visible art. That art was settled for it. It was accepted as part of the established order of the State, and so it ran its course without regret and without ambition. Now, the Renaissance was a conscious

#### Return to the Art of the Past,

to the art, that is, of the Roman Empire. It was not a mere revival. It was a deliberate and successful attempt to enter into the spirit of the great Roman architects. What makes it the more remarkable, and, indeed, without parallel in history, is that there already existed another method of architecture in full and complete maturity, for Gothic architecture had reached the very limit of technical skill—witness King's College Chapel alone. Yet men were prepared to turn their back on this traditional art, they were learning to welcome the new method, to repudiate their familiar language, as no longer adequate to their needs. For the first time we strike the characteristic note of modern art, its intense subjectivity, its deliberate consciousness. This momentous change in Architecture did not result from the craftsman's instinctive habit of refining on the past, but from a change in the direction of intelligence, from a certain revulsion in ideas, not from the action and re-action of craftsmanship.

#### Two Methods of Development.

For changes in Architecture come about in one of two ways. When a method (or style, to use a doubtful term) is fairly established as traditional, the actual manipulation of materials by workmen and the introduction of new materials, lead to the extension and modification of the style itself, as, for instance, the growth of Perpendicular Gothic out of Decorated. The development comes from within and proceeds more or less unconsciously. But there is another source of change in architecture. In the course of ages the seeds of change are slowly at work, till there results some great upheaval of ideas which dislodges mankind from its mental anchorage. The old idioms seem meaningless, the familiar formulae barren, and then comes that tentative effort after a new expression, which will gradually expand and consolidate into a permanent art. A new factor will have taken its place in human intelligence, which has to be recognised, however much our sympathies may lie with the art it has replaced. Such a change occurred at the Renaissance. Since the fighting days of the dark ages civilisation had steadily advanced. Men were rich, intelligent, learned, and the keener and more active minds had long since shown impatience of mediæval standards and idioms. There was but one direction in which this enterprise could find its natural outlet, and this was scholarship. Latin was the familiar language, scholars naturally turned to the country of its birth, and so from the study of the literature of Rome they came to the study of its art, and that art was adopted with enthusiasm as the only fit

#### Expression of Humanism,

that new motive in thought and morals which the Renaissance won back for mankind. In this regard Alberti is typical of the Earlier Renaissance, a man of noble family and brilliant personal qualities; he can have found little to attract him in the professional side of Architecture. His reward lay in his keen enjoyment of the art, in the occasion that it gave him for the exercise of his own fastidious scholarship. Thus, the peculiarity of the art of the Renaissance is that it was much more than a mere change of technique. It was the result and the expression of a new order of ideas which had been slowly growing for generations until it became articulate in art; something altogether greater than the small ephemeral fashions which are all that the nineteenth century has to show by way of a Renaissance.

#### Effect on English Builders.

Now, how did the English builders regard this far-reaching movement? I think it is quite

plain that in the first instance, and indeed, for several generations, they did not in the least understand it. In the first place, they themselves were ingrained in the Gothic tradition, trained exclusively in its method of construction, and unfamiliar with any architecture but that of their own country, one might almost say of their own county. And, in the second place, they were introduced to this new art by amateurs. Merchants and scholars travelled in Italy and brought back astounding stories of its magnificent palaces. Soldiers and ambassadors, such as Lord Henry Marney, Lord Sandys of the Vyne, or Sir Richard Weston of Sutton Place, able and observant men, saw and appreciated the wide significance of the new movement abroad; and the King himself and Wolsey set the fashion by importing Italian artists for the decoration of their palaces. All the inspiration came from the Court, and the wealthier upper classes; and the English builder, probably somewhat against his will, had to set to work to master this strange new fashion.

#### Italian Influence.

The only acquaintance with it, as amongst Englishmen, was possessed by amateurs, and the workmen at first had to follow their instructions with such help as they could get from the work actually executed by Italian craftsmen in this country, and it is to be borne in mind that, in actual fact, not many Italians were over here, and that the majority of them with the exception of such men as Torregiano, Rovezzano, and the Majani, were quite inferior men. The results were the most ridiculous blunders in grammar, for the Englishmen endeavoured to make some rudimentary acquaintance with the orders by way of ornament, and planned and constructed their houses according to their own tradition. As the sixteenth century went on, and the first Italian influence disappeared, their workmanship fell off, but their knowledge of the orders grew. Students, such as John Shute, with some architectural training, were sent out by noble patrons to make systematic study of Italian architecture; and the German and Flemish workmen who succeeded the Italians brought with them an abundance of pattern books; so that the business of decorating houses with fatuous ornament proceeded apace. I have mentioned elsewhere that singular instance at Shaw House, near Newbury, a building which I think characteristic of the state of mind of the Englishman in the time of Elizabeth. Here the owner had himself built a good house of brick and stone on the ordinary Elizabethan plan, but he then adorned it with inscriptions in Greek and Latin, I cannot help thinking from their wording, with some little vanity in his own superior scholarship and knowledge of Italian art. Yet, in fact, the man was barely within the fringe of his subject. Correct details and Latin and Greek inscriptions were not of the essence of the Italian Renaissance, and it required a finer brain and closer training than was possessed by either amateur or builder of the sixteenth century to see the meaning of the great change that had taken place in Italian, and through Italian, in European art.

#### Influence in England.

Yet even in far-away England the air, if one may say so, was instinct with its influence. The horizontality of Elizabethan architecture was itself a dim reflection of the great recovery of the Italian Renaissance; and the day was fast approaching when an Englishman of genius would see his way through all these troubled efforts and grasp the principle, the basis of idea, that underlay this fundamental change in architecture. Let us consider for a moment what that principle was. In spite of the researches of such men as De Geymuller, our younger students are rather apt to consider the architecture of the Italian Renaissance as an affair of detail. Their attention is arrested by its exquisite carving, its arabesques and other details, which form such a tempting subject for illustration. Yet all this detail might go, and the value of the work of the great Italian architects remain untouched. For the basis of their work, and it is this which gives it permanent value, lay in construction; their real accomplishment lay, not

in ornament, but in their avoidance of it, and in their past-mastership of proportion and of the intellectual problems of architecture. They studied to some purpose the remains of the

### Stupendous Architecture of Rome.

Not only did they extend to a point as yet undreamt of since the days of the Empire, the use of domes and simple vaulting, but they recovered the use of the lintel in combination with the arch. They threw off the unreasonable intricacy of detail with which later mediævalism had encumbered Architecture, and brought back the art to its abstract basis in construction, that is to say, to the simplest and most direct methods of building, the lintel for crossing narrow spaces, and the arch for wide ones (I speak of course, without regard to steel and iron construction, at that time practically undreamt of), flat ceilings, domes, or the simplest forms of vaulting, for covering in their areas. The great recovery—that the Italians made from the remains of Roman architecture was this use of the lintel and the arch in construction, and the use of domes and simple vaulting. A dull man might have recovered its detail, but only the genius of

### Brunelleschi or Peruzzi

could have disentangled these constructional ideas, simple as they seem to us now, and showed how they could be applied easily and naturally to every case, as an elastic method of construction, not merely as an exercise in scholastic canons of design. Given, then, a certain method of construction, in good architecture, the design in all its multifarious parts must follow it. To the arch the Renaissance added the lintel; and it is in the play upon these abstract motives that the real significance of Renaissance architecture lies. Now, the first Englishman who really grasped this fact was

### Inigo Jones;

and it is for this reason that his work is so profoundly interesting to us, and so completely differentiated from the work of his predecessors. At length there had appeared a man who understood architecture as the Italians understood it; who brushed on one side all the detail and ornament which had seemed to the Elizabethan and Jacobean designers the whole essence of the art, and had gone straight for the heart of the matter; realising that, after all, Architecture is simple construction, ennobled and idealised by the working upon it of a powerful brain and highly-trained imagination; and that its strength lies in its own abstract qualities, fine proportion, bold distribution of masses, extreme reticence and simplicity of ornament. He saw—and few had seen it in England since the days of early Gothic—that

### Architecture is not Ornament;

that ornament, indeed, is only one, perhaps a subordinate one, of the many weapons which Architecture has in her armoury. For the first time after a hundred years of blind experiment, this country possessed a real architecture, a complete and flexible language. Instead of a set of quotations from a foreign tongue, it possessed at length an organic style. I need not dwell at any length on the brilliant ability with which Inigo Jones used this style. His exact and fastidious refinement is familiar to all students. Perhaps we are not all so familiar with the masterful freedom of his designs. It has been customary to insist on the greater versatility of Wren as compared with Inigo Jones, and a writer in the "Times" once attempted to make some absurd distinction between Jones and Wren, treating Jones as an Italian, and Wren as the first English architect proper. The writer in the "Times" had the usual knowledge of amateur critics; but those who have studied the work of Inigo Jones and Wren know, in the first place, that

### Wren

could never have started where he did if Inigo Jones had not preceded him; and, in the second place, that it is a complete mistake to identify the work of Jones with that pedantic version of Palladianism which the eighteenth-century architects set up as his particular

manner. That Jones did adopt Palladio's Architecture as the last word of the Italian Renaissance is, of course, undeniable; the point to be realised is that, whatever his imitators may have done, Inigo Jones himself worked with all the freedom of genius, a freedom founded on the most intimate mastery of the actual technique of his art. In this regard I think the distinction between Jones and Wren has been very much exaggerated, and Wren followed the lines laid down by Jones far more closely than has been generally supposed.

### The Decadence began with the Eighteenth Century,

with the men who succeeded Wren. Where Wren designed, these men copied, and they copied the least attractive features of Inigo Jones and Palladio. The pedantic conception of this man of genius which exists in the amateur mind is really derived from Kent's publications and eighteenth century copies of his work. I do not propose to follow further the course of English Renaissance architecture. The eighteenth century architects allowed their art to be collared—if I may be permitted the phrase—first by amateurs and afterwards by men of letters. The strength of the old tradition kept them within some reasonable limit—at least, as late as the early part of this century. But, that

### Romantic Element of Literature,

which had made its first incursion in the days of Horace Walpole, has encroached on Architecture with disastrous rapidity and power in this century; so much so that, a generation back, it almost seemed as if the last trace of our fine traditional Classic would disappear under the preachments of men with no exact knowledge of Architecture, who approached the subject from a standpoint entirely out of relation to the art itself. It would have been a curious result if that great development of Architecture which owed its first origin to scholarship, should have suffered its final extinction at the hands of the literary amateur. To put together the results of this very general survey, I would suggest the following conclusions as

### The Teaching of History:

(1) that the Italian Renaissance itself was the necessary result of far-reaching causes; (2) that our English Renaissance in its kind and degree was a part of this movement, and is not therefore to be dismissed as a mere change of expression in Architecture, but must be accepted as part of an inevitable development, precluding a return to the motives and ideas that lay at the back of mediæval art; (3) that in Architecture the real work of the great Italian masters was to rediscover, almost to recreate, new methods of construction and proportion; (4) that the fact was not realised by the Elizabethan builders, who could not see the wood for the trees, and that it actually took about 100 years of experiment to produce the man who could see beyond this detail, and establish order and logic in the tangled maze of English Architecture; (5) lastly, and as a corollary to this, that the mere fact of his having done so, and the circumstances of the case, have brought about a permanent change in the work and position of the modern architect, to which I will call your attention later. Now, how do we stand at this moment in regard to

### The Theory of Architecture?

I do not mean abstract theory as to its philosophical basis, but our own attitude to the art. What are the sources to which we look for inspiration? What are the ideals at which we aim in actual design? I fear that the answer to this question can hardly be satisfactory. We are, here at the end of the nineteenth century, in a condition of greater uncertainty, and more complete absence of conviction than, I should say, at any previous period of history. You have merely to look back upon the last 100 years. We began the century with the remains of the classical tradition, but Adam had already "improved" it, as he thought: Stuart and Revett had done their work, and the Greek fashion was well in

the ascendant. Then came Pugin, ardent, fanatical, full of energy and narrow ideas, a very iconoclast in regard to the old tradition; and after him

### Ruskin,

who thought he had found the key to Architecture in his personal preferences, and the morality of Exeter Hall. Then came the rush for Gothic, Early English, Early French, Early Italian, with a vehemence that threatened to sweep the board clear of everything but a heterogeneous collection of details from every country. Every man has been for himself, and meantime Architecture has gone to the wall. The serious study of Architecture, not only as an art, but also as an expression of the intelligence which is not arbitrary, but determined by certain inevitable causes, has almost dropped out of sight, and I suppose that in practice the very worst work that has ever been done in England has been done in the last fifty years. I need hardly add that a few men of powerful and original mind have done admirable work, but the average of Architecture has been left untouched, and it is by the average level that the state of Architecture has to be gauged. I do not think that we can look back with pride on the

### Artistic Attainments of the Nineteenth Century,

judged from any standpoint, and it appears likely that we shall enter on the twentieth century without having hit upon any certain way through this quagmire of modern Architecture. It is here that the study of the past must help us. I have elsewhere endeavoured to trace the stages through which the function of the modern architect has developed. The days of the craftsman working independently, yet in unconscious unison, ceased, when the choice of styles arose. He tasted of the tree of knowledge, and henceforth to his knowledge of his craft had to be added the responsibility of conscious judgment, if he was to undertake, I will not say Architecture, as it might be thought to beg the question, but building of any sort at all. Because, in any building nowadays, a man has to use one

### Method of Expression

in preference to another, and implicitly in this there is raised the whole question of selection. Now this responsibility proved too much for the simple craftsman, as you may see from the blunders in design which abound in more ambitious Jacobean works; and it was only a question of time how soon there should arise the man who had sufficient training and intellectual capacity to enable him to discriminate between good and bad, to enable him to grasp the logical coherence in expression, which is an essential element of Architecture. As soon as such a man arose, the matter was settled for good or bad. The architect ceased to be a craftsman in the technical sense, and what might be lost in

### Craftsmanship

was assuredly gained in Architecture. I think, therefore, that this critical function of an architect, this detachment from the actual details of craftsmanship, which chafes the enthusiasm of some of by no means the least gifted of our younger men, is of the very essence of his work. The more of craftsmanship he has the better; but a man may be a very good architect without being a very good craftsman—I mean a good craftsman in the sense of being able to carve his own woodwork and model his own ceilings. His craftsmanship must be of a wider range. It must embrace full knowledge of the past; it must rest on a constant habit of analysis of the best methods of expression in building, and a keenly critical insight into the abstract qualities of Architecture, mass, balance, rhythm, and proportion. An architect, to my mind, should be like a fastidious man of letters, he should not be content to express his purpose anyhow, he should be anxious to find the exact inevitable phrase. It is in this sense, I think, that an architect should be an artist of the highest order, and this is the position that has, in fact, been forced upon him since the days of the Renaissance.

COTTAGE HOMES AT MIDDLEWOOD. FIG. 6. FRONT ELEVATION OF RECEIVING AND SPARE HOMES. MESSRS. BUTTERWORTH AND DUNCAN, ARCHITECTS.

Perhaps this reflection may be some consolation to those who would reluctantly abandon the idea that in craftsmanship lies the future of Architecture. Nor, again, is this ideal less exacting than the other. To attain to this faculty of reasonable judgment it is clear that a man must possess knowledge of what has actually been done in Architecture—the more the better, provided he is not over-burdened by it; and this knowledge is not mere student's learning, but means a practical knowledge of buildings, gained by careful analysis and measurements, and by exact observations of materials and local circumstances. A lifetime of constant study is not too much for such a task. I would suggest to you, therefore, to those of you, that is, who are now beginning your career, but there is no shortcut to Architecture through pattern books, or even through the pleasant paths of detail craftsmanship; but that, nowadays at any rate, you must have knowledge, and that now, as always in the history of Architecture, you must seek that knowledge, not only in books, but also in the builder's yard and on the scaffolding of buildings. I have still one more point to bring before you. Perhaps in this paper I may seem to you to have insisted too much on knowledge, too little on imagination, and this criticism has also been made on some remarks of mine elsewhere. In the first place, I would point out that we seem to be face to face with some dangerous developments of originality, or rather eccentricity. To judge by the majority of our buildings, it appears to be thought that "knowledge hampers imagination," as it was put by the eminent Capability Brown. Certainly the results are a very nightmare of Architecture. Now there is only one antidote to this sort of originality, and it is knowledge. I fancy that some of the more accomplished of our original designers would be rather surprised to find that the flattest of their ogees, the boldest of their amazing proportions, have been anticipated, not only in Italy, but even in England. Even a cursory knowledge of the work of such a man as Baldassare Peruzzi would show them that profound knowledge is not incompatible with the most complete freedom in design; and, further, that the most daring imagination can co-exist with the most trivial detail. You may recollect the indignation of the old Sieur de Chambray at the pretensions of the men of his time, who thought that by turning a capital upside down, or something of the sort, they had invented a new Architecture, "as if the Pantheon" (I quote the Sieur de Chambray), "that same stupendous and incomparable structure, were not the invention of the architect who built it, because he has vary'd nothing from the Corinthian ordnance, of which it is entirely composed." In the second place, and this is the gist of all that I have said, this knowledge is not an end, but a means. For an architect does not study in order to reproduce what other men have said once and for all, but to perfect his own mastery of expression; and just as a poet does not invent a jargon of his own, or write in the language of Chaucer, but takes the current language of his time, and compels it to his pur-

pose, so an architect should not waste his time in a vain ambition for a new style, or a futile copy of an old one, but should master the best in all the Architecture of his country, and thereby find ample language for his own individuality. It is not styles, therefore, that we are concerned with, but style, that indefinite quality of all good architecture, whether Greek or Roman, Gothic or Renaissance; indefinable, and ever varying,

because it varies with the individuality of the artist, because it depends on the faculty that the man possesses of giving the simplest and yet the most complete expression of all his purpose. It is here that knowledge must come in as the groundwork of good Architecture. We want to know, as part of our training in our art, how other men in the past have solved the difficulties that confront us now; and it is only by this long laborious study that we can learn to discriminate between good and bad, and to free our own method of expression from what is trivial and irrelevant. It is this way, I think, and not along the pleasant paths of the amateur, that there lies the best chance of the architecture of the future.

(Our report of the discussion which followed the reading of Mr. Blomfield's paper is held over till next week.)

**The Amalgamated Society of Engineers.**—Speaking at the first annual dinner of the Joint Trades Union, at Stratford New Town, Bro. A. W. Golightly, A.S.E., said that the struggle in the engineering trade had been settled just fourteen months, and in that short time the Engineers' Society had paid off all its debts incurred during the lock-out, amounting to over £47,000, and the issue of their next balance sheet would show a membership of 84,000, and a balance in hand of over £207,000.

# COTTAGE HOMES AT MIDDLE- WOOD, NEAR ROCHDALE.

BY ESTHER WOOD AND G. LL. MORRIS.

(Continued from page 87.)

THE object of the "receiving home" to the left of the superintendent's house (Figs. 4, 5, and 6), is to keep all new-comers in quarantine for a certain number of days, for fear of any infectious illness, however slight, being thus communicated to the whole colony, and to judge also of the suitability of the children for certain homes. Plans have already been drawn up for a separate infirmary (Fig. 7)—a long, narrow building of the bungalow type, with two groups of wards isolated by corridors, and a central block for doctors' and nurses' apartments. This, however, is still in abeyance, and in the meantime the two spare homes, built on the same plan as Figs. 4 and 5, are well equipped for cases of illness, and could

ends of the block, each holding seven beds, while the central bedrooms contain five. Between these are the mother's room, and a spare room for use as desired. We might strongly recommend that this, if possible, should be accepted as a clothes room, lined with drawers or cupboards for things not in daily wear, and having screens in the centre so arranged as to dry and ventilate garments frequently worn. It is surprising to find in certain homes, under other Boards of Guardians, children being taught the most insanitary habit of folding up their clothes at night and stowing them in a basket under the bed! Their matron or managers seem to have sacrificed all considerations of hygiene to the fetish of tidiness—an idol to which the health of households has too often been offered up. Garments that have been worn all day, especially by children bathed but once a week (a restriction still in force in some such homes)—should surely be spread out to air, not by the bedside, but in another room; or at least near to an open door or window.

## MOSAICS.

BY H. J. POWELL.

A LECTURE on "Mosaics," with lantern illustrations, was given at the Central School of Arts and Crafts last Friday evening by Mr. H. J. Powell.

The lecturer said that artistic crafts are always to be found where colour is. It often happened that the description of the technique for one craft suggested a new application for another, and he hoped that a description of the steps that have been taken in endeavouring to re-introduce mosaic into England might be of interest and of use to the students of the school. As far back as early in the sixties experiments were being made in England; but it was in 1890 that the great impetus to the re-introduction of mosaics was given, when the Dean and Chapter of St. Paul's determined to hand over the decoration of the Cathedral to Sir William Richmond. Sir William resolved that it should be done

FIG. 7. PLAN OF FUTURE HOSPITAL. MESSRS. BUTTERWORTH AND DUNCAN, ARCHITECTS.

easily be used in the event of infection. In the centre of the receiving home is a large kitchen (with scullery behind it), in which the children meet for meals, while the house to right and left of this is divided into "girls' side" and "boys' side," each with its own "store," and its own playroom. In the centre of the first floor, over the kitchen, is the mother's room, communicating both with the boys' and girls' side of the building; and at each end is a dormitory for six beds. There are also two spare bedrooms for elder children or invalids, and two large linen cupboards. This building, with the exception of the Boys' Home, is the best planned of any; the idea of the large central kitchen on the ground floor, common to both boys and girls at meal times, suggests an arrangement full of pleasant possibilities, which Poor Law Guardians might do well to consider carefully in future schemes. In the description of the Boys' Home we refer to this more in detail.

We come next to the several pairs of cottages in which—pending the progress of co-education in this country—the boys and girls are kept more rigidly apart. The centre of the ground floor in each pair of boys' cottages (Figs. 8, 9, 10) is occupied by the respective playrooms, which are divided from each other by the party wall. Here, surely, was an excellent opportunity to throw the adjoining rooms into one large hall, and by housing boys in one cottage and girls in the next, to allow them at least to spend their recreation hours together. Perhaps even yet this development may occur in the colony without the disasters of a social revolution, and we believe that the Rochdale Guardians are not intending to separate the sexes under eight years of age.

Above the playrooms are two bedrooms. A door in the middle of the party wall affords passage in case of fire or other emergency from one side of the building to the other. Two larger bedrooms occupy the respective

It is satisfactory to find bathrooms in the cottages. One would think that in all homes for children these would be a *sine qua non*, but it has been urged by other Guardians making similar experiments that the standard of comfort should not exceed that of a laborer's cottage.

(To be concluded.)

**A Church Tower to be Demolished.**—The tower and buttresses of St. Matthew's Church, Douglas, Isle of Man, are to be demolished, and the space used for market purposes.

**Douglas Water Supply.**—The Corporation of Douglas obtained leave on Wednesday last to introduce a Bill into the Manx Legislature authorising them to construct a new reservoir in West Baldwin at a cost of £49,000.

**The restoration of Wellington Parish Church** is now nearly complete. Marble-cased columns have been added to the building, and the heating and ventilating arrangements have been improved. Mr. C. R. Dalgleish, of Wellington and Shrewsbury, is the architect.

**A Gladstone Memorial for Liverpool.**—At a meeting held in the Liverpool Town Hall on Monday last week for the purpose of promoting a memorial to Mr. Gladstone, a fund was started which yielded the substantial sum of £2200, including one donation of £150, and sixteen of £100 each.

**Condition of the Southend Pier Tramway.**—At a recent meeting of the Town Council the mayor stated that if a Board of Trade inspector came down and inspected the tramway he would condemn it at once. The Council, therefore, instructed the borough surveyor to do the necessary repairs (which are estimated to cost £600), with the assistance of the electrical engineer.

by English craftsmen and with English materials; and the work he was doing was a great one, whatever critics might say to the contrary.

Mr. Powell told his audience that he wished to put his position clearly before them; it had been defined by an eminent authority as that of colour-maker, and it was as a colour-maker that he wished to speak to them. It was not his intention to try to deliver an instructive lecture, but merely to describe experiments that had been made, and the lessons that had been learned from them. His intention was to talk about the actual material, how it was prepared, something about the cement used, and something about the lessons that had been learned from the work.

The first step taken was to obtain fragments of the work of the old mosaicists. These having been got and examined, it was found that except in very early work, the material used was glass in one form or another; but where special effects were desired, bone, ivory, and mother of pearl, had been used. The general material, however, was glass. The reason marble had been abandoned for glass was pretty obvious, because from the glass-pot much brighter colours can be obtained than from marble. Chemical analysis showed that this is true. The glass was made of sand, soda, and lime. Chemical analysis also showed that the capacity of the colouring of the glass, except in the case of red, where it is due to copper and excess of iron, is due to a large dose of white oxide of tin. Oxide of tin, when mixed with a transparent water colour, had a chalky effect, and with a view to modifying this effect, he introduced instead powdered felspar.

The speaker then went on to state that from a copper colour you can get red, blue, or green. To obtain ordinary dark red or purple blue, cobalt should be used; and to get a violet, manganese. An excess of violet, he said, gave a good black. A yellowy green was

COTTAGE HOMES AT MIDDLEWOOD. FIG. 10. FRONT ELEVATION OF BOYS' HOMES. MESSRS. BUTTERWORTH AND DUNCAN, ARCHITECTS.

produced by using oxide of chrome. By mixing together suitable proportions of oxides, a very great range of colours was obtainable. In the cooling process very many colours ranged themselves into strata. Fine effects were obtained by the old mosaicists by a judicious use of untarnished streaks of gold in their work. The method by which they manufactured their gold mosaic was to first of all blow a thin film of glass, then to spread it on a thin sheet of gold leaf heated, and then drop on the surface some opaque glass, which was pressed so that the whole formed an absolutely solid mass. If one of these gold cakes were taken and heated, the heat would break up the gold leaf and show the colour of the base glass through, so that the colour of the base is shown modifying the colour of the gold, and by doing this the shade of the gold can be changed to almost any extent. One of the most striking features in the work of the old mosaicists was the very limited number of colours they used. When Sir William Richmond started his mosaics he used a good many colours, in fact, about one hundred; but he soon discovered that there was no need to use such a number if a smaller variety were put where they ought to be placed—above the eye. The mosaicists of Rome boast that they use something between a thousand and two thousand colours, but this is rendered necessary by their peculiar system of mosaic. They profess to copy oil paintings, but their finished work is very unsatisfactory. The whole method is a most extravagant way of using material and labour.

There are many ways, said Mr. Powell, of putting mosaics together. The old way was to spread the cement on the wall, cut out the designs, and then place the pieces in. But as the designs became more elaborate, the need of supervision increased, and it became necessary to introduce other systems.

In 1890, Sir William Richmond decided to go back to the original method. His object was, Mr. Powell believed, not to produce educational pictures, but to add colour and decoration to the part of the structure where they were most needed. In order to get the greatest value he could from his material, he determined to use for his surface the ordinary broken untouched fracture of the glass, and he also resolved to place his tesserae in the most favourable position he could with regard to light; and so as to get the full effect from contrasting colours, as well as the full decorative effect from the joints, he (Sir William) came to the conclusion that it was absolutely necessary that the tesserae should be placed on the wall in the chancel. In this work each workman had a part traced from the original cartoon, the mere outlines of the mosaic being pricked through the tracing paper. The process was very simple and quick, and the workmen had now gained considerable experience and knew exactly where to place their tesserae in order to obtain the best result from their material. The speaker was of the opinion that if mosaic is ever adopted in England generally as a practical method of permanent decoration, full credit ought to be given to Sir William Richmond's influence. Sir William, he said, had had the courage to discard the system of studio mosaic, and to substitute a practical system.

Cement was made by the old professors on the plan of the Roman pavement cementers, who used brick, marble, lime, and water. This was always put up in two layers, the first coarse, and the second finer. It set very quickly and hard, but had two faults—it was very heavy and involved a second working. In the sixteenth century the idea was started to substitute raw oil in the place of water. Cement made with raw oil does not set quite so fast and can be used in a single layer. Oil cement is used in St. Paul's.

In mosaics great consideration must be given to the joints. If the colour of the joints was not allowed for it would eventually affect the whole tone of the mosaics. It had been alleged that the so-called degradation of mosaics was due to the introduction of oil into cement, but he thought that this was a wrong idea. The idea was that by using an oil cement there was left some chance for alteration, as the cement did not set so fast; that it took a certain amount of responsibility off the craftsman, and involved a loss of spontaneity in the work, he did not believe. The real cause of degradation, he thought, was due to persons designing mosaics who did not understand the material they were designing for. When fresco work was introduced rivals sprang up against the old mosaicists in the shape of such artists as Raphael, who by degrees ousted the old

mosaicists, and after a time these craftsmen were so overwhelmed by the fame of their rivals that they gave up the attempt of designing altogether, and accepted the rôle of executing the designs of the artists. The speaker thought that this was much the cause of the fall of mosaics. The artists did not like their pictures placed high up, but wanted them brought down to the eye; this was done, and affected the whole system. He felt, he said, rather nervous in talking about designing, as he did not profess to be a designer; but the way to learn about designing was, in his opinion, to get a thorough knowledge of the successes and failures of the old masters, and he thought the first thing they would learn, would be that their work must be flat. He thought that a restricted palette made for harmony of colour. The most difficult colour to deal with was gold. The old mosaicists, going back to the fourth and fifth centuries, used it with great judgment, mainly for the trimming of drapery, lines in clouds, in water, and in foliage, and the effects they produced were exceedingly beautiful. When they used gold in a mass they were careful to break it up.

In conclusion, Mr. Powell said that he would not advocate the teaching of mosaic at any of the technical schools at present, or at any rate, not until the architects have made up their minds how they are going to use it.

**The Institution of Civil Engineers** held its annual dinner in the old hall of Lincoln's Inn on Wednesday evening last. Mr. W. A. Preece presided over the function.

**Engineering Works at Kirkcaldy.**—At a meeting of the Town Council last Monday week it was reported that the North British Railway Company had withdrawn their opposition to the Electric Lighting and Tramway Bill now before Parliament. The Provost also intimated that when the Council's deputation are in London in connection with the Bill Lord Morley will be asked whether or not the Town Council, in conjunction with the North British Railway, can adopt a scheme for assessing the public to the extent of 6d. in the £1 for the new harbour.

## R. I. B. A.

## GOTHIC ARCHITECTURE.

By JOHN BILSON, F.S.A., F.R.I.B.A.

THE ordinary meeting of the Royal Institute of British Architects took place on Monday night, with Professor G. Aitchison (president) in the chair. The minutes having been read and confirmed, the Secretary announced the decease of Frederick Mew (Associate, elected 1859), and William Reddall (Associate, elected 1874). The President then formally admitted members attending for the first time since their election.

Mr. John Bilson then read his paper on "Beginnings of Gothic Architecture: Norman Vaulting in England."

By way of preface to his subject, Mr. Bilson had contributed a paper to the *Institute Journal*, reviewing recent investigations of French archæologists into the origin and development of Gothic Architecture. The following were the principal works referred to: *L'Architecture religieuse dans l'ancien diocèse de Soissons au XI<sup>e</sup> et au XII<sup>e</sup> siècle*, by E. Lefèvre-Pontalis; *L'Art Gothique*, by Louis Goussier; *La Transition*, by Anthyme Saint-Paul, in the *Revue de l'Art chrétien*; *Monuments religieux de l'Architecture romane et de transition dans la région picarde*, by C. Enlart, and *Die Anfänge des gotischen Baustils, zur kritik des gegenwärtigen Standes der Frage*, by G. Dehio, in the *Repertorium für Kunstwissenschaft*. The author commended these researches to the attention of English students still prone to accept as final the judgments of earlier writers, such as Viollet-le-Duc, some of which have been found untenable in the light of more

## Recent Inquiry.

Mr. Bilson stated that in his prefatory paper he had made free use of Herr Dehio's masterly treatise, the general conclusions of which must in the main eventually win acceptance, even among the younger French school of inquirers. In opening his paper on "Norman Vaulting in England," the author touched upon the development of Norman Romanesque, resulting from the revival of architecture in Normandy early in the eleventh century, and noted some of its most striking characteristics. Available literary evidence tends to show that some of the Norman methods were already in use in England before the Conquest, but we are not justified in believing that the design of these English buildings was marked by the logical precision so characteristic of Norman work, or that the English had taken any step in the direction of vaulting over their churches. In studying the development of vaulting, as illustrated by English examples between the Norman Conquest and the middle of the twelfth century, the author dealt first with the vaults of the lower parts of churches, such as aisles and crypts, citing existing examples of the various forms described.

## The Groined Vault

in its simplest form results from the intersection of two semi-cylindrical vaults at right angles to one another—a survival, in fact, of the Roman groined vault. Generally, however, these groined vaults are banded by semi-circular transverse arches or "doubleaux," usually of simple square section, and forming a kind of permanent centring. The adoption of these doubleaux, however, involved considerable inconvenience in the construction of the springing of the groin. In the Roman groined vault and its imitations the groin springs from the external angle of the pier or pilaster. In many of the Early Norman vaults the groin springs either from the internal angle formed by the junction of the transverse arch at its springing with the wall-face, or from the face of the wall or arch close to the angle. As the vaults were constructed of rubble masonry with thick joints, and covered with plaster, this method of springing the groin was obviously defective as a matter of construction. Consequently we find the difficulty met at a very early date by a further development in

the membering of the supporting pier; the pilaster which carries the transverse arch is flanked on each side by a secondary pilaster which affords an independent support for the groin. In some crypts where the vaulting is supported by single cylindrical shafts, the springing of the vault is sub-divided in a similar manner, so as to give a separate projection for the springing of the groin. A further advance consisted in the substitution of a shaft for the square pilaster which supported the groin. At Saint Etienne, Caen, and at Winchester Cathedral, an improvement is found in the construction of certain of the vaults. The haunches of the vault, for a short distance above the springing, are constructed of ashlar, above which the vault is of rubble, plastered. Having described the modification the simple groined vault underwent when necessitated by the oblong or irregular plan of the bays to be vaulted, the author passed to his main subject, the

## Ribbed Vault.

Wherever it originated, or whatever the circumstances under which it was evolved, the advantage gained by the introduction of the rib was obvious. It afforded a permanent centring for the groin, the weakness of which in vaults over wide spans must always have rendered them liable to failure. It completed the membering of the vault, which had commenced when the transverse arch was added to the Roman groined vault. The new expedient was readily adopted and rapidly developed by the Normans in England as well as in Normandy. The Cathedral Church of Durham is the most complete early example of the adoption of the ribbed vault in England. Contemporary chroniclers record that every part of the church was covered with ribbed vaulting between 1093 and 1133. The plan of the choir and east side of the transepts shows that it was the intention from the first to cover both the aisles and the main spans with the vaults which were actually constructed. The aisle vaults of choir and transepts (the various features of which were described in detail by the author), constructed under Bishop William between 1093 and 1096, are clearly part of the original work; masonry and mouldings correspond in character with those of the choir arcades, and, for constructional reasons, the aisle vaults must, as usual, have been erected along with the main walls.

## The Vaults of the Nave Aisles,

the characteristics of which were next discussed, are the work of Bishop Ralph Flambard (1099-1128), and, as he completed the nave as far as the high vault, the aisle vaults may safely be attributed to the first decade of the twelfth century. They correspond in character with the aisle vaults of choir and transepts, except in a few minor points. The next dated example of ribbed vaulting is to be found in the reconstructed parts of the transepts of Winchester Cathedral. The original work in these transepts belongs to the church which Bishop Walklin commenced in 1079, and which the monks entered in 1093. The works of reconstruction necessitated by the fall of the central tower in 1107, are easily distinguishable from the original work by the different thickness of the masonry joints. The date of these ribbed vaults may be put within two or three years after the tower fell. Peterborough Cathedral presents examples of ribbed vaults, the date of which is proved by documentary evidence. The earlier church was destroyed by fire in 1116, and the present building was commenced in 1117 or 1118. In 1140, or 1143, the monks entered the new church. The parts then completed include the choir and east side of the transepts (except, perhaps, the clerestories). The aisles of choir, and transepts throughout, are covered with ribbed vaults, the distinctive features of which the author described. The paper then went on to discuss M. Félix de Verneilh's conclusions with regard to

## The Peterborough Vaults,

on which M. Lefèvre Pontalis based his statement that the ribs were added afterwards in the second half of the twelfth century. M. de

Verneilh's theory was that the supporting shafts were designed to receive the projecting groins of unribbed vaults, and that the actual ribs were added afterwards. In the recent taking down and rebuilding of the central tower, however, no evidence whatever was found to support this theory. It is clear that these Peterborough vaults are original from the fact that they do not stand alone, but are analogous in their method and construction to a large number of vaults which cannot all be the result of such an alteration as M. de Verneilh suggested. The author then passed to the consideration of examples of similar ribbed vaults to which, in default of documentary evidence, approximate dates only can be assigned from the character of the work. The following examples were discussed: The vaulting over the north aisle of the nave of Gloucester Cathedral, which may be safely assigned to the first twenty years of the twelfth century; Avening Church, Gloucestershire, ribbed vaults, c. 1120-1130; Southwell Minster, the aisles of the nave of which are covered with ribbed vaults, c. 1120; the Priory Church of Lindisfarne, built by Edward, who died probably near the end of Ralph Flambard's Episcopate (1128)—the church throughout was covered with ribbed vaults, and its design is evidently inspired by Durham; the nave of the abbey church of Dunfermline, also inspired by Durham, probably erected soon after the accession of David I. (1124); Selby Abbey Church, whose eastern bays of the nave also afford marked indications of Durham influence; Romsey Abbey Church, vaults of choir aisles, and the church at Lessay, Normandy—examples interesting as showing how the idea of the ribbed vault was introduced, during the course of construction, in works originally planned only for unribbed vaults; the two churches at Devizes, Wiltshire, affording examples of aisleless chancels covered with ribbed vaults, and to be attributed with some probability to the architectural influence of Bishop Roger, of Salisbury, and dated approximately c. 1125-1130, St. John's being slightly earlier than St. Mary's. The difficulties which confronted the builders of these early ribbed vaults, so long as they employed only semi-circular, or

## Semi-elliptical Curves

for the ribs, were entirely surmounted by the adoption of the pointed arch for the doubleaux. The nave aisles of Malmesbury Abbey Church have been frequently quoted as the earliest example in England of this new method of construction, and have been attributed to Bishop Roger of Salisbury; it is scarcely probable, however, that the rebuilding of the church was commenced before the Bishop's death in 1139; it must nevertheless have closely followed that event, and the existing nave cannot be assigned to a later date than the middle of the twelfth century. There is no evidence whatever to support Mr. C. H. Moore's assertion that the vaulting is an imitation of French work. The style of Malmesbury is purely Anglo-Norman, and shows no trace of the influence of such French work as the chapel of Bellefontaine and Saint Denis. At the same time the Malmesbury aisle vaults bring us to the threshold of the complete Gothic vaulting system, and almost to the time when French influence undoubtedly began to affect English work.

(To be concluded.)

**The Design for New Law Courts, Cardiff**, which was reproduced in one of our inset plates on March 15th, was made by Messrs. C. E. Mallows and Grocock, in conjunction with Messrs. Brewill and Bailly. The name of the former firm was accidentally omitted from the inscription printed under the illustration.

**Heating and Ventilation for Hospitals.**—The additions to the Fever Hospital, Bolton, are being warmed and ventilated by means by Shorland's patent Manchester Stoves with descending Smoke Flues, Shorland's patent Exhaust Roof Ventilators and Inlet Panels.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### MODEL ANSWERS TO BUILDING CONSTRUCTION QUESTIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you kindly inform me of any book containing the past science and art exam. questions (elem.) on building construction, worked out, stating price and publisher.

"ELEMENTARY."

We would suggest that application be made to Professor H. Adams, 60, Queen Victoria Street, E.C., who prepared and published worked-out solutions to the questions set on building construction at the Science and Art Department Examinations for many years, and, we believe, does so still.

### COLONIAL SURVEYORSHIPS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be much obliged if you would kindly inform me where I can obtain particulars of the Civil Service Examinations for Colonial surveyorships, also salary, &c.

"ENQUIRER."

Civil Service Examinations are not held for Colonial Surveyorships, which are only to be obtained locally, but occur with tolerable frequency for the following appointments, all of which carry with them the possibility of service at foreign stations: Assistant surveyors, Royal Engineer Civil Staff; assistant surveyors, H.M. Office of Works; assistant surveyor, Admiralty; assistant civil engineers, Admiralty. The rate of pay is in all cases good, with fairly regular increase and a pension on retirement; but only well prepared candidates can hope to succeed as the competition is severe. Full particulars are to be obtained *gratis* from the Secretary, Civil Service Commissioners, Cannon Row, S.W.

### WAR OFFICE SURVEYORSHIPS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you inform me as to where I should apply for past examination papers set for the assistant surveyors to the War Office? Also, the conditions and rules laid down governing the election of candidates to these positions?—Yours truly,

Dublin.

J. J. McA.

Examination papers set in October, 1898, for Assistant Surveyor R.E.C.S., can be had from Eyre and Spottiswoode; John Menzies and Co., 12, Hanover Street, Edinburgh, and 90, West Nile Street, Glasgow; or, Hodges, Figgis and Co., Ltd., 104, Grafton Street, Dublin; price one shilling. Those set in November, 1896, are likewise to be had at the same price. Particulars of examination can be obtained from the Secretary, Civil Service Commission, Cannon Row, S.W. The conditions and the exam. syllabus were different in 1898, from 1896, and in all probability they will be again changed before the next exam., so I am afraid you will not profit much by studying the official publications. The whole question of the status, duties, and appointment of the surveyors is being considered by a War Office Committee, and it is impossible to say what may happen.

### SEWAGE FROM INFECTIOUS DISEASES HOSPITAL.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—How many satisfactory ways are there of disposing of the sewage matters from an Infectious Diseases Hospital which is erected on a level piece of ground in the country where there is no public or other sewer, but there is a stream or river about 20ft. wide about half a mile distant? Where can I obtain full particulars of all the latest

details of construction and fittings in connection therewith? The name of such a hospital which you think a good and complete example would be esteemed.

"STUDIOUS."

Sewage from infectious diseases hospitals is capable of communicating infection to any night-soil with which it may be mixed in privies, drains, or cesspools, and after disinfection it should be disposed of without delay, and under the safest conditions possible. A Local Government Board circular, in dealing with this question, says that, "after having been treated with acidified mercuric chloride in ample quantity, the excreta may safely be put into an ordinary closet, but special care as to the flushing of drains and special frequency in the removal of receptacles must be insisted upon." This advice seems to require reconsideration, inasmuch as Koch has shown that mercuric chloride, unless in strong solutions, may be inefficient. Excreta passing into closets and thence to streams may, even after so-called disinfection, spread disease through an entire district. The only safe method of disinfection is to be found in the employment of heat. In order to apply this agency, the infectious matter must be heated for several hours in steam ovens, or steam must be passed through it, the gases being led into a fire and burnt. A small quantity of phenol or mercuric chloride in solution should be added. Another method for the sterilisation of such matter by heat consists in the separation and destruction of solid matter in an incinerator. Liquid effluent may be treated chemically, and finally filtered through "Polarite," which is an agent having remarkable power of oxidation and purification. "Polarite" is produced by the International Purification Syndicate, Westminster, from whom full particulars as to its use may be obtained. It is fortunate that the stream mentioned by our correspondent is at some distance from the hospital, but unless great care be exercised it may become a means of distributing disease amongst those who dwell on its banks.

W. N. T.

### COLD STORAGE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you kindly inform me, through your Enquiry Column, the best way to construct a small cold storage, about 5ft. by 3ft. and 8ft. high? 1. What is the most suitable non-conductor, and the minimum thickness of outside wall? 2. The best position for the ice; and should it be separated from chamber by a conductor, or be in direct contact with air? 3. Method of ventilation?—Yours truly,

J. A. S.

Ipswich.

A cold-storage chamber may be constructed by covering a light stud framing on both sides with matched boarding, filling in the intervening space with sawdust, or, better still, silicate cotton, which is one of the best non-conductors of heat. The minimum thickness of non-conducting material is an unknown quantity. What is required in such a structure as that under consideration is that the internal temperature shall be affected as little as possible by external influences; and this is better secured with a thick, than by a thin packing. A thick coat means less ice required to maintain a given temperature in the cold chamber, and *vice versa*. Ice is usually placed overhead, and rests on wood bearers in a zinc tank, which forms the ceiling, a pipe being connected thereto to carry off the water as the ice melts. But the ice may be, and sometimes is, used upon the floor of the cold chamber, and such an arrangement has been successful with the chamber walls formed of a single thickness of  $\frac{3}{4}$  in. boards. Ventilation implies a constant movement of air, and this it is desirable to avoid as much as possible; and as, despite all precautions to the contrary—unless air-tight joints are provided—air currents will be set up in greater or lesser degree, and as, also, in consequence of frequent reference to the articles contained in the chamber, the air will be constantly changed, no special arrangements for ventilation need be made except in special circumstances.

## Correspondence.

### STRAINS IN BEAMS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—It is a great pity that the author of this article should have fallen into so elementary an error as to confound "stress" and "bending moment;" it is greater pity that he should have tried to sustain his position in the face of Mr. Grenville's clear explanation (on p. 72, No. CCXIII.) of the point at issue; and it is a greater pity still that in doing so he should have introduced another term, "strain," having again another meaning, into his attempted defence, adding still further to the confusion. Apparently, he is ignorant of the very meaning of the terms he uses, clear definitions of which are to be found in the Glossary of "Specification," and is ready to repeat the blunders of previous writers without caring to investigate them—possibly without knowing his subject well enough to enable him to do so.—Yours faithfully,

G. A. T. MIDDLETON.

### MOISTURE DURING FROST.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The question as to whether two dissimilar articles—the one a good conductor and the other a bad conductor—exposed to the same degree of heat or cold, will vary in temperature is one upon which much difference of opinion exists. That two such substances continuously exposed to the self-same influence will eventually attain the same temperature cannot be denied; but, in all ordinary fluctuations of temperature, the better conductor of the two will be the quicker to correspond to any change either of heat or cold; hence, I maintain that it by no means follows as a matter of course that the proposition put forward by me on p. 50 (March 1st) merits the contradiction of "Engineer" on p. 92 (March 15th). If "Engineer's" statement is correct, why is it that a thermometer placed upon the grass during a cold night will register differently from a similar instrument suspended a foot from the ground? And why is it that two similar thermometers, the bulb of one being dry and the other kept continually moist (Mason's hygrometer) will record a variation of temperature, even when subjected to precisely the same influence of either heat or cold? Cold, as we understand the term, is largely dependent upon the amount of moisture suspended in the atmosphere; and any substance which absorbs moisture will be perceptibly—and I think actually—warmer than any substance which will not absorb and therefore condense the moisture. Condensation can only take place through the intervention of a colder body, and the very fact that heated air will give up its contained moisture upon contact with a painted wall when it will not do so—or, at least, not to the same extent—upon a wall covered in paper, is, I think, pretty conclusive evidence that the former is actually colder than the latter for the time being. What applies to cold should also apply to heat; and if any one needs to be convinced that dissimilar articles exposed to the same influence may, and do, vary considerably in temperature, let him expose pieces of wood and iron to the influences of the sun's rays for an hour; or let him take the stone block and the wool mat, each at 40 degrees—C. or F.—and expose them for, say, fifteen minutes to a temperature of zero. I will guarantee, Sir, that it won't need a thermometer to differentiate between the temperature of either of the pairs of substances. Theoretically, "Engineer" is right, but he is arguing upon a wrong hypothesis. If we could assume that everything in and upon the earth altered its temperature at the same rate, then my contention is wrong; but according to the sensibility of various substances, so do their temperatures vary. As "Engineer" says, Nature is not deceived; and if she consents to condense moisture on a painted wall, when she will not do so on one that is papered, isn't that a plain verdict of Nature that the painted wall is the colder of the two?

"THE WRITER OF THE ANSWER."

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

March 22nd 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

**Bradford Fire Station Competition.** THE Bradford City Council apparently are not to be moved by protests. The Council as a whole have accepted the recommendation of their committee with regard to the plans for the proposed Central Fire Brigade Station, and have decided to apply for authority to borrow £30,000 (exactly double the amount named in the conditions of competition as the limit of cost) for the purpose of carrying out the accepted designs. At the monthly meeting of the City Council, held on the 14th, the letter of protest from competing architects, which appeared in our issue last week, was referred to the Watch Committee. On the motion that the minutes of that committee be adopted, some discussion took place, which showed that whatever might be the opinion of the Council as a whole, there are individual members who are by no means satisfied with the manner in which the competition has been decided.

**The Committee's Defence.** The Chairman of the Watch Committee, Mr. J. Moorhouse, replied to, but certainly did not dispose of, the objections that had been raised. He admitted that even yet the committee has not come to a decision between the three alternative designs submitted by Messrs. Mawson and Hudson; they all, he said, met the requirements of the committee. He maintained that the greatest possible pains were taken to arrive at a fair decision; the committee spent three full half-days in going over the plans in every detail, and everything was fair and above board. There were no names and no distinguishing marks upon the plans by which the members could recognise the architects, and until the letters were opened he had not the slightest idea as to who had drawn them. Of course, said Mr. Moorhouse, they could not expect to satisfy all the competitors. Perhaps not, but they might have taken some pains at least to comply with the conditions they themselves laid down. We do not accuse the Chairman and the Watch Committee of any intentional unfairness, but we repeat that the criticisms contained in our article of March 1st (of which a copy was sent to every member of the council), and in the protest of the architects which we printed last week, have not been answered.

**Architects and Surveyor.** SOME little unpleasantness has arisen at Swansea, in consequence of the Borough Surveyor poaching on the preserves of the architects. At a meeting of the Property Committee of the Corporation, a letter was read from the architects of the town protesting against the borough surveyor being instructed to prepare designs for the temporary buildings in connection with the Intermediate School for Boys on the ground that if his staff is large enough to enable him to take private work, it is too large for the ordinary duties of the office, and if, on the other hand, his staff is

only sufficient to cope with the ordinary work of his office, the public interest must suffer by his taking up private work; also, that Mr. Bell is a civil engineer and surveyor, and not an architect. In discussion, it was said that the work had more reference to excavations and levelling than Architecture, and that the buildings were only to be temporary. It was decided to allow the letter to lie on the table. On the face of it the grievance, if any, seems a very small one, not worth making a pother about.

**The Abuse of Advertising.** THAT useful society, the Society for Checking the Abuses of Public Advertising, has been tackling the Chancellor of the Exchequer on the subject of the taxation of exposed advertisements. The hon. secretary of the Society, Mr. R. Evans pointed out that in France the stamps on *affiches* amounted in 1897 to nearly three and a half millions of francs, and the income in the United Kingdom from an equivalent tax would be proportionately greater. A moderate impost would reduce the gross value of displayed advertisements without causing any real loss or hindrance to the legitimate forms of announcement for business purposes. It might have been supposed that the Chancellor, in view of the heavy deficit impending, would have jumped at this proposal. But he didn't; in reply he wrote that "he can only regard the matter from the point of view of revenue; and, looked at from that point, he does not see on what ground a tax on advertisements could be defended unless newspaper advertisements were included. He does not think it necessary to dwell on the objections that would certainly be raised to such a tax." The society, in a second letter, submitted, in answer to this, that a newspaper, until purchased by someone else, was the exclusive property of the producer, whereas the advertisements objected to were forced upon the attention of the citizen in the public thoroughfares, leaving him no means of retaliation or self-defence, and they pointed out that there were many analogies in the existing fiscal system for the discrimination advocated.

**A Spirited Offer.** A WEEK or so ago Mr. St. Clair Baddeley, a member of the British-American Archaeological Society, gave to some friends and acquaintances a lecture in the Forum at Rome on the subject of the Forum and the Basilica Æmilia, the magnificent hall of Phrygian marble erected in honour of the consul Æmilius in the second century B.C. In the course of the lecture Mr. Baddeley laid stress on the importance of the site now occupied by a number of third-rate houses under which lie parts of the Forum and the Basilica which have never been explored. He mentioned that the cost of buying up the houses which cover this archaeological mine would amount to about £2500. Among the audience was Mr. Lionel Philips, who at the close of the lecture remarked that the only way he could recompense the lecturer for the pleasure he had experienced in listening to so real and vivid a description of the triumphal return of the Romans laden with so many trophies of Greek sculpture and Greek Art would be to contribute, if allowed, to the cost of expropriating the houses and carrying out the excavations. He therefore authorised the lecturer to announce to Signor Baccelli, the Minister of Public Instruction, his readiness to contribute £2500 to the undertaking, the money to be utilised exclusively for buying up the houses and excavating the sites. It is to be hoped the Italian Government will take advantage of this generous offer, as it can hardly fail to lead to archaeological discoveries of great value.

**The New Vauxhall Bridge.** We commented last week on a statement made by Mr. Ward, Chairman of the Bridges Committee of the L.C.C., respecting the circumstances attending the selection of the design for the new Vauxhall bridge. At last week's meeting of the L.C.C., Dr. Longstaff asked whether the Institute of British

Architects had been consulted as to the design of the new bridge since the method of construction in concrete was adopted; whether the Bridges Committee desired the new bridge to be an ornament to London, and, if so, what steps they proposed to take to secure that end. Mr. Ward said that the answer to the first question was in the affirmative. The Committee of the Institute of British Architects had been seen three times on the subject of the original design of the bridge. The arches were then of steel, but as a result of these interviews the Committee, on the advice of their engineer, arranged to build the arches of concrete faced with granite. Fresh drawings were made and a model was prepared in plaster on a large scale. The Committee of the Institute was again invited by the engineer to view both the new drawings and the model. Messrs. Waterhouse and Mountford alone came. And as the result of this further interview, Mr. Waterhouse wrote the letter he had referred to last week. After approving the design of the bridge, the letter made some further suggestions on minor matters, and some of these would no doubt be incorporated in the working drawings which were being made for the arches. The piers had been decided on some time ago and the contract had been let. The architects seemed to differ greatly among themselves. He certainly hoped the new bridge would be an ornament to London; but even now the Committee would be glad of any further suggestions or criticisms from the architects.

**The Architects' Version.** IN reply to Mr. Ward's statement, it will be sufficient to quote from a letter which Mr. Locke, secretary to the R.I.B.A., sent to the committee on February 21st, and which was published in the "Times" on March 10th. "I have to state," wrote Mr. Locke, "that the communications which have passed between this Institute and the London County Council—dating back to 1894—have been almost entirely confined to the construction of an iron bridge with stone piers, a form of construction originally insisted upon by the Bridges Committee, but subsequently abandoned. . . . Details, suggestions, and criticisms dealing with an iron structure are not, however, applicable to one completely dressed in stone, and the only inter-communication afforded by the engineer in reference to the stone-clad design (recently made public), has been the interview alluded to in your letter between Sir A. Binnie and Mr. Waterhouse and Mr. Mountford, which interview was, at Sir A. Binnie's instance, to be considered informal and confidential. . . . At the same time, I am to express surprise that the London County Council should have fallen back upon an expressly confidential letter and interview to base its refusal, more especially when my council have had no opportunity of seeing the design or forming an opinion upon it until its recent publication."

**Municipal Trading.** THE question whether municipalities should engage in trading operations in competition with, or to the exclusion of, the private trader, is one upon which it is desirable that we should all make up our minds. The present day tendency is, beyond doubt, in the direction of the municipalisation of many things that were once regarded as matters for purely private enterprise. The question is whether this tendency is a good or an evil one. From the point of view of certain interests it is undoubtedly dangerous, but from the larger standpoint of the public welfare we have no doubt whatever that the tendency is one to be welcomed and encouraged. Two publications have recently been issued which help towards a right understanding of the question. The one is a pamphlet on "The Cost of Municipal Trading" (P. S. King and Son, Orchard House, Westminster), being a reprint of a paper read by Mr. Dixon Henry Davies before the Society of Arts, together with a report of the discussion which followed. The other is a Parliamentary paper giving a return of the reproductive undertakings conducted by the municipal corporations of England and Wales.

**Conflicting Statistics.** MR. DAVIES, who treats his apparently dry subject in a very bright and entertaining manner, contends that the representative check on local expenditure is inoperative and insufficient, that municipalities are piling up enormous debts, discouraging inventiveness, and imposing heavy burdens on the ratepayers without giving any adequate returns for them. These contentions are supported by a number of statistics and charts, which show clearly enough the increase in local debt, but fail to show what proportion (if any) of that increase is due to the trading operations of the municipalities. When we turn to the examination of the other set of statistics—that contained in the Government return—we find it abundantly proved that, taking the country over, the municipal undertakings result in huge profits which go towards the relief of rates; and it must be remembered also that the municipal service is, and often better, and nearly always cheaper, than that supplied by private enterprise. We find that municipal waterworks throughout the country have yielded, during the past five years, an annual net profit of £1,744,361, and gasworks a net profit of £1,180,208. The other items dealt with in the return are tramways, electric lighting, markets, baths, canteen-tries, working-class dwellings, piers, quays, &c. The profits shown in each case tend to disprove the contention of Mr. Davies, the Earl of Wemyss and others, that the community suffers through keeping the management of these matters in the hands of its own representatives.

**The Workmen's Dwellings Bill.** THE bill for assisting workmen to become owners of the houses they occupy, which was introduced into the House of Commons last week by Mr. Chamberlain, is one of those small measures about which it is impossible for anyone to be enthusiastic. As a contribution to the serious and pressing problem of the housing of the working classes it is hardly worth considering. The utmost it is likely to accomplish is to enable a thrifty workman here and there to become the proud owner of a jerry-built suburban cottage. The bill will not apply to houses of a higher value than £300, and it will be quite voluntary in its operations. The workman need not borrow unless he likes, the house owner need not sell unless he likes, and the local authority need not lend unless it likes. Doubtless the bill, if passed, will do no particular harm, but neither will it do much good. It certainly will not solve the housing problem.

**A Building Trades' School.** The London County Council, last Tuesday week, on a recommendation of the Technical Education Board, agreed to purchase the Brixton Baths from the Lambeth Vestry for £4,000, for the purpose of converting them into a Building Trades' School. The Board has had the subject under consideration for two or three years. Upon inquiry it found that forty-one representative firms in various branches of the Building Trades, having 12,000 employes had only eighty apprentices and 143 learners, instead of 1600 which would be about the normal proportion. The building trades in London are mainly recruited from the country, and, as a result, London boys find a great difficulty in obtaining situations with employers who will teach them their trade. The Polytechnics, it is well known, are not sufficient to meet the difficulty. The Board found that the men and boys engaged in the building trade come mostly from Hackney, Wandsworth, Lambeth, and Camberwell. Hackney has a school in Cassland House, and the baths at Lambeth, it is thought, will provide for those in the South of London. The baths are in Ferndale Road, Brixton, and are situated on a site of about 49,000 sq. ft., and the buildings already there cover only about one-fourth of the site. If this scheme is carried out as it should be, it will provide qualified workmen who can start at full wages, thus obviating the opposition which workmen put forth against apprenticeship, as tending to lower the rate of wages.

## NEW BATHS AND WASHHOUSES FOR SHOREDITCH.

LAST Saturday, the new baths and washhouses, which have been erected for the vestry of Shoreditch, were formally opened by Mr. James Stuart, M.P. As the building is among the best designed and best equipped of its kind to be found in London, a short description will probably be read with interest. The ground floor plan and the three elevations are given in one of our inset plates. The joint architects of the baths and washhouses are Messrs. Spalding and Cross, of Queen Street, who were chiefly responsible for the plan, and Mr. Henry T. Hare, of Bloomsbury, who designed the elevations.

### Constructional Details.

The buildings have frontages to three separate streets—viz., Pitfield Street, Coronet Street, and Bowling Green Walk, the first named being the main front, which has been designed to group with the adjoining free library. The whole of the elevations are faced with best red facing bricks, with buff terra-cotta dressings supplied by the Burmantofts Company, and the roofs are covered with red tiles. In the interior of the building glazed bricks and tiles have been very largely used, and the woodwork in the main corridors and large swimming bath is of teak. The whole of the floors and flat roofs are of fireproof construction, and the roofs over the swimming baths, laundry, &c., are constructed with wrought-iron principals. Perhaps the most notable feature of the building is the

### First Class Swimming Bath,

which is remarkable for the elaborate arrangements made for accommodating a large number of spectators. The swimming pond measures 100ft. by 40ft., and extensive galleries, with seating accommodation for 520 people, run round three sides of it. The whole of the space at the sides of the bath can also be utilised for spectators if necessary, as the dressing boxes are so constructed that they can be easily and quickly folded back against the wall where they form a neat panelled dado. This bath has been licensed by the London County Council as a public hall for meetings and entertainments, and it will be so used during the winter months. The bath lends itself to this purpose much more readily than do the majority of swimming baths. When floored over it will accommodate about 2000 people. There is ample and direct ingress and egress, and the necessary cloak room accommodation is provided. The second-class swimming bath is 75ft. long and 34ft. wide; it is provided with fifty-six dressing boxes, and a soap bath. This bath is to be used as a gymnasium during the winter months.

### The Slipper Baths,

which number seventy-six, are fitted in excellent style. All the baths are porcelain, and the woodwork is teak. The partitions in the first-class baths are of St. Anne's marble, and in the second class of slate. The public laundry is on the ground floor level, and contains fifty washing compartments and fifty steam-drying horses, as well as fittings for ironing and mangling. The greatest care has been taken in protecting every part of the machinery, to avoid any possibility of accident. No boilers are used, and no coal is required. All the heat is supplied by means of

### Exhaust Steam

from the adjoining electric lighting station. This steam, which, unless so utilised, would be wasted, is so manipulated by means of an elaborate system of condensers, valves, and pipes that it supplies the whole establishment, including the laundry, with all the heat required, thus effecting a very great economy. Largely owing to the adoption of this system it is confidently expected that the new baths will not only pay their way, but will show a substantial profit on each year's working.

The ratepayers of Shoreditch, if one may judge from the demeanour of those of them who attended

### The Opening Ceremony

on Saturday afternoon, are well satisfied, as indeed they ought to be, with the latest evidence of the public spirit of their vestry. The ample seating accommodation of the first-class bath was taxed to the utmost with the crowd that gathered to inaugurate the new undertaking, and the proceedings were throughout of a cordial and even an enthusiastic character. Mr. E. J. Wakeling, the chairman of the Baths and Washhouses Committee, who has the advantage of being himself an expert swimmer, made a short statement relative to the inception and progress of the bath scheme in Shoreditch, after which Mr. James Stuart, M.P., formally declared the baths open. In the course of his speech Mr. Stuart referred to the fact that the vestry had erected on what was practically, so far as the public were concerned, a waste space the free library, the electric lighting installation, and the baths and washhouses, the whole forming a wonderful collection of the results of the municipal enterprise of Shoreditch. Mr. Stuart spoke in appreciative terms of the efforts of those who during the past twenty years had striven to cultivate among the people of the parish a strong sense of public duty. It should never be forgotten, he said, that public enterprise was not, as some thought, antagonistic to private enterprise; rather was it the direct consequence of private enterprise, and it would be found that where private enterprise and ability were most conspicuous public enterprise was most effective and beneficial.

### The Bath in Use.

Mr. Stuart's address, which was punctuated by frequent applause, was followed by what proved to be the most popular item of the afternoon's entertainment. Mr. Wakeling, the Chairman of the Committee, appeared in swimming costume and took the first plunge in the new bath, swimming the whole length of the bath under the water. A short entertainment was then given by a number of well-known amateur swimmers, after which Mr. S. G. Porter, Chairman of the Shoreditch Vestry, proposed a vote of thanks to Mr. Stuart for his performance of the ceremony. In the course of his speech Mr. Porter spoke of the great need for such an institution in Shoreditch in view of the fact that two-fifths of the population, or nearly 50,000 people, lived in one or two-room tenements which were necessarily without conveniences for personal and domestic cleanliness.—Mr. H. T. Sawell, L.C.C., seconded the motion, which was carried with enthusiasm, and Mr. Stuart briefly acknowledged the compliment.

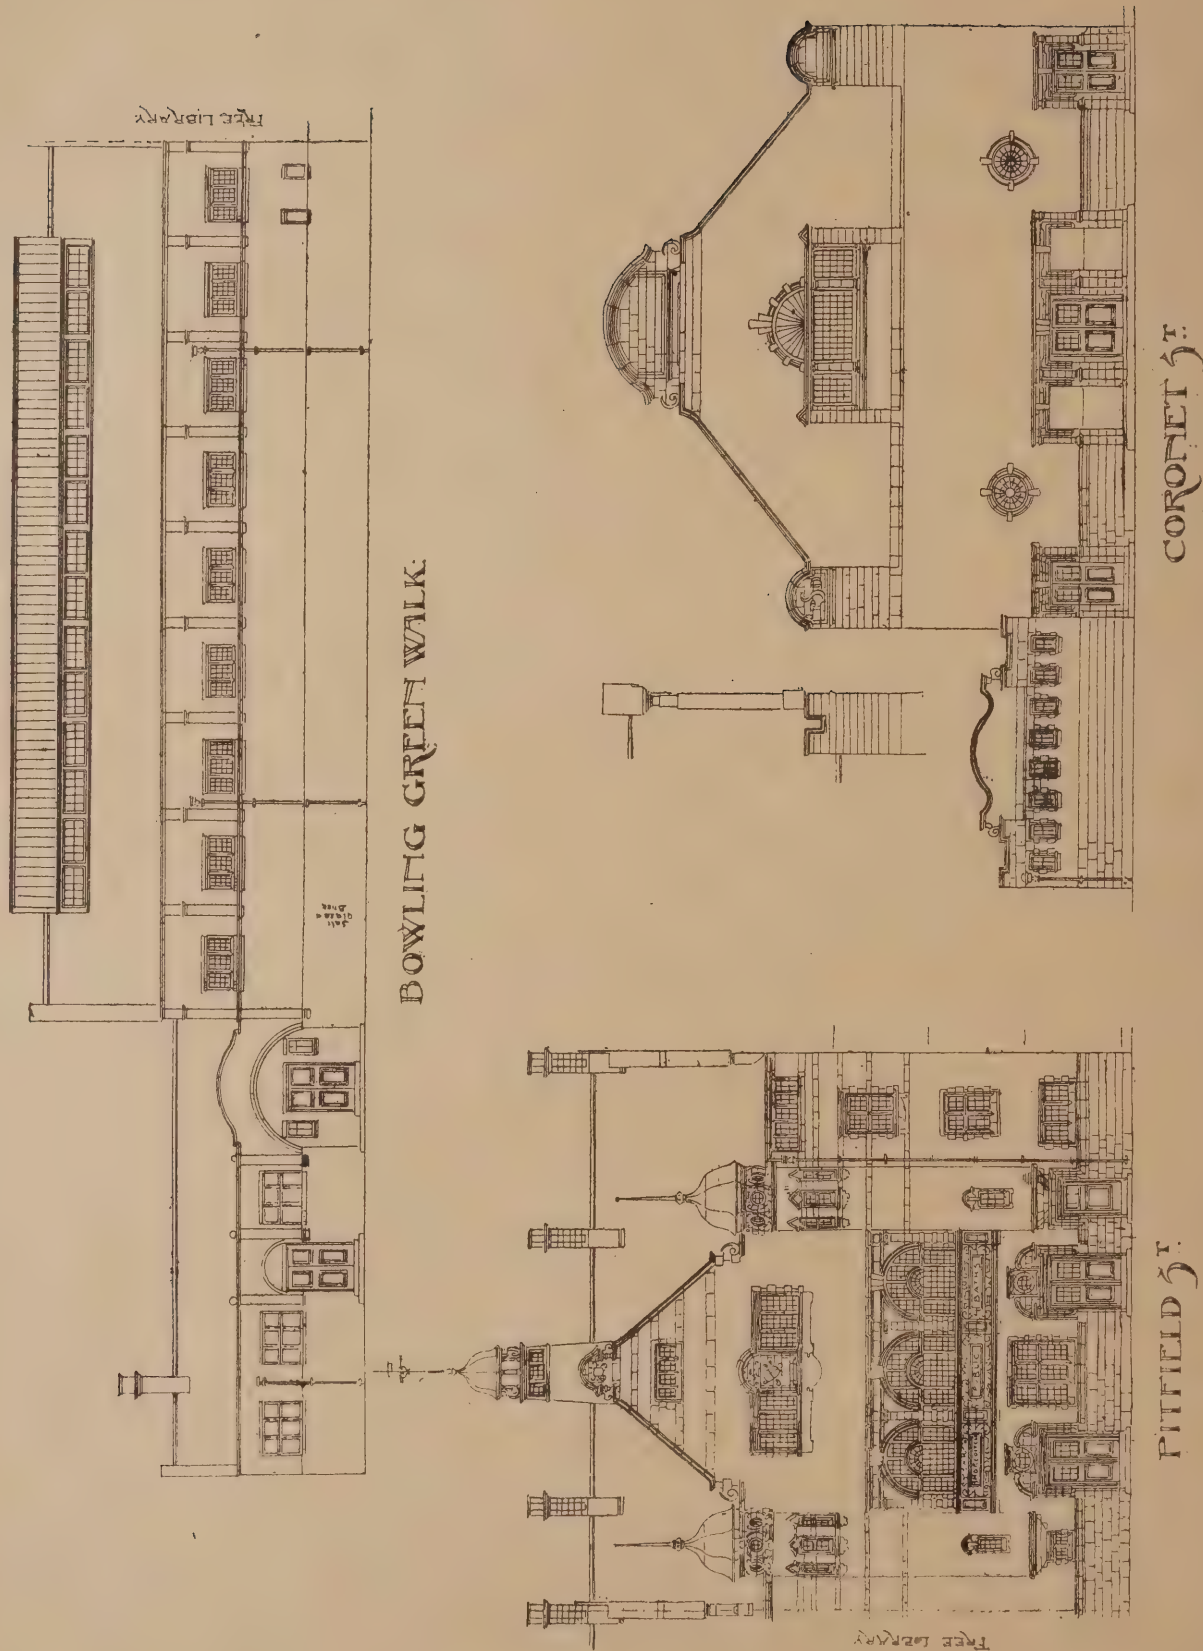

### The Utilisation of Waste Products.

Mr. Henry Ward, L.C.C., in proposing a vote of thanks to the Committee for their services, explained to the audience the way in which the baths were heated by the utilisation of exhaust steam. This, he said, was one of a series of processes by which what were usually regarded as waste products were turned to good account. First the refuse of the parish was burnt in the dust destructor station, and, instead of the waste heat going up the chimney, boilers were put over the furnaces and steam was generated which served to drive the engines in the adjoining electric lighting station. Then they got another waste product, one that might easily become a nuisance, as it did in many localities, viz., the exhaust steam. The Committee were advised that there was a means of utilising this exhaust steam, and accordingly, it was taken from the electric lighting station and passed into the baths to warm the water and the air of the building. There was yet another waste product—the water condensed from the steam; this was made to flow back into the electric lighting station where it served to feed the boilers, thus effecting a considerable saving to the vestry in water rate. The vote of thanks was seconded by Mr. Edward Austin and heartily carried, after which a cordial vote of thanks to the popular and energetic chairman, Mr. Wakeling, brought the proceedings to a close.

## Views and Reviews.

### "THE MOTOR CAR JOURNAL."

We have received the first number of this new illustrated newspaper, which is devoted to the interests of those concerned in self-propelled traffic. The journal is excellently got up, being printed on good paper, and is cheap at 1d. per week. It is not confined to dry technicalities, but treats in a popular way on many matters more or less closely connected with the Motor-car. The new journal is calculated to apply a much needed stimulus to an industry that is full of promise for the future, but has not hitherto come up to expectations in the matter of accomplishment.

### DRAWINGS BY ALFRED STEVENS.

At the Galleries of Messrs. Carfax, 17, Ryder Street, St. James's, are collected some drawings by that great genius, Alfred Stevens, to whom the British nation gave small encouragement while he was alive, though he is now recognised by all whose opinion is worth having as towering above most of his contemporaries. The Wellington monument, his most important work (over which he broke his heart), remains incomplete; the little lions on the railing outside the British Museum (one of the few entirely satisfactory things made for London streets) have been removed, and now can only be seen in a museum; and it is said that by a curious irony another man whose name sounded the same, but was spelt differently, was elected associate of the Royal Academy by mistake for him. So difficult is it for genius to obtain substantial recognition while it lives.

The drawings shown at Messrs. Carfax's gallery are such as are interesting principally to the painter, who finds with surprise that a sculptor can draw finely. They are of two classes—original studies in red chalk of grouping, gesture and casts of drapery and drawings made in lead pencil from Italian frescoes, mostly of the earlier schools. As these were made before 1842, they show that Stevens was a pioneer in the appreciation of the primitives which Ruskin and the pre-Raphaelites did so much to foster. Many of them are from Florence, but a drawing from Benozzo Gozzoli's frescoes of the life of St. Augustine shows that he went as far afield as San Gimignano. A few are touched with colour, where the costume appears to have been the object, though more usually the composition and the character of the heads are the points noted.

The drawings in red chalk show many parts of figures and portions of casts of drapery repeated over and over again with small variations, making the effect of the whole drawing confused, as in Nos. 10, 17, and 29, the climax of which practice is reached in No. 23, where the model has moved and the second pose is drawn over the first. That is to say, that one sees here the mechanism of Stevens's design, drawings never intended to be exhibited. The finest drapery study is perhaps No. 16, a man wrapped in a great cloak, seated, and warming his hands. No. 5—a side view of a man in violent action, as if digging—a design probably made to fill a circle with a portion of the figure, is drawn with great knowledge and decision, and a companion composition is No. 32, in which the lines are well arranged to fill the space.

There is also in the gallery a scrap book which is interesting, as showing what sort of things Stevens found useful for his work and thought enough of to make sketches and tracings of.

A. W.

### TWO USEFUL ANNUALS.

Both these books are primarily intended for the use of officials and members of public bodies, and to such they are indispensable; but there is no reason in the world why they should not circulate widely amongst other sections of the community. Architects, for instance, who

enter competitions, and builders who tender for contracts advertised by local governing bodies must frequently stand in need of some such work of reference.

Dealing first with the "Local Government Annual" we find that the present issue, the eighth, is considerably larger than those of previous years. A considerable section of the book is devoted to "An Encyclopædia of Local Government," which gives an astonishing variety of useful facts in a singularly attractive form. Here we have the new journalism applied to statistics, and the result is certainly noteworthy; it is no slight achievement to present facts and figures about drains and sewers, water and gas companies, hospitals and telephones, tramways, and a hundred other matters in short, bright paragraphs that are not merely informing, but positively entertaining. Nevertheless, the method has its drawbacks; you cannot see at a glance what information the book contains, and you may have some little difficulty in finding the information you require. An ample index would to a great extent obviate the latter difficulty; the list of contents at the beginning of the volume is altogether too meagre.

The "Municipal Year Book" is wanting in the "tit-bits" element which gives a certain piquancy to the volume just noticed, but on the other hand the aim of the book as a work for constant and easy reference has been consistently kept in view. There is a copious index, and the contents are arranged on a definite and easily intelligible plan. A chapter on Municipal Legislation in 1898 is followed by one which explains very clearly the curious jumble of London Local Government, and points out what duties are carried out by the various authorities. The functions of the London County Council and of the Corporation are clearly defined. The method adopted in dealing with local government in the provinces is to give under the heading of each town, county borough, or Urban District Council a succinct statement of its municipal history, and information as to baths, lighting, technical education, &c., with names of councillors and officials. The space devoted to each town is roughly proportionate to its size and importance. Rural District Councils and Boards of Guardians apparently are not considered of sufficient importance to find a place in the volume. The inclusion of even the briefest particulars regarding them would add much to the value of the work. Various matters of special interest are dealt with in separate chapters rather than in the sections devoted to each town. These special chapters, which are full of invaluable information, deal with tramways, the housing of the working classes, and the supply of water, gas, and electricity.

"The Local Government Annual." Edited by S. Edgecombe-Rogers. Price 2s. 6d. "The Local Government Journal" Office, 2, Dorset Street, Fleet Street, E.C.

"The Municipal Year Book." Edited by Robert Donald. Price 2s. 6d. Edward Lloyd Limited, 12, Salisbury Square, E.C.

**A New Harbour.**—The Seaham Harbour Dock Company is offering for subscription 21,165 preference shares, entitled to a  $4\frac{1}{2}$  per cent. cumulative dividend, and 1500 ordinary shares. The harbour at present is only fit for the reception of vessels of 1000 tons burthen; the new dock will accommodate vessels of 5000 tons burthen. The cost of the new works will be £378,000; they are expected to be open in two or three years, and completed in four years.

**A New Variety of "Arc" Lamp** has been on show at the offices of Messrs. Eldon, Edmonds, and Hayward, Finsbury House, Blomfield Street, London. Its inventor, Mr. W. Davy, claims that it has many advantages over the ordinary electric lamp, the chief of which is that its loose parts are reduced to a minimum—to one in fact—and this facilitates regulation by non-experts. Perfect insulation is claimed to effectually prevent the communication of fire particles to their surroundings, an important matter in places filled with inflammable goods. The lamp is also devoid of the buzzing noise when alight which is one of the objections to some lamps.

## Keystones.

**Two new Theatres** are to be built at Nuneaton.

**The Burne-Jones Exhibition** is to remain open until April 8th.

**A Reservoir Burst** at Leachramuie, near Glenfinnan, last Saturday week.

**The Leeds City Council** have decided to borrow £150,000 for electricity purposes.

**A kiln collapsed** at the Cement Works at Beeding last Tuesday week, and two men suffered slight injuries.

**Camel's Head Bridge, Devonport**, is to be reconstructed, and will be 42ft. wide, including a footpath on each side 6ft. wide.

**The Enlargement of St. James's School, Huddersfield**, has cost about £1500; the schools were reopened on Saturday, last week.

**Alterations at the Central Meat Market** are being carried out on the premises of Messrs. T. Borthwick and Sons by Mr. W. E. Hazell, architect, of 23, Moorgate Street.

**Additions and Alterations** to the steam laundry at the infirmary in the Archway Road, Highgate, London, are being supervised by Mr. J. Budley, Engineer, of Suffolk House, Laurence Pountney Hill, London.

**A reredos** erected in the chapel of St. Thomas's Hospital, in memory of the late Sir Henry Doulton, was unveiled yesterday by the Bishop of Rochester. The reredos is the gift of Sir Henry's son, and has been designed by Mr. Tinworth.

**A Celtic Cross** is on show at the premises of Mr. Robert Simpson, North British Granite Works, Constitution Street, Aberdeen. The principal embellishment is a pictorial representation in granite of sacred incidents. The monument is formed of white Kemnay granite.

**The Leicestershire County Asylum Site** will consist of about 180 acres of land in the parish of Narborough, and will cost £18,000. Plans are to be prepared for an asylum of 650 beds, with an administrative block adequate for 800 patients, at an extra cost of about £120,000.

**The Architect to the London County Council** has been selected, in the person of Mr. William Edward Riley, by the General Purposes Committee, who have recommended him to the Council for appointment. There were forty-three applicants for the post, which carries £2,000 a year.

**Proposed New Shambles at Grimsby.**—Negotiations between the Police Commissioners and Messrs. Charles Brown and Co. Limited, for the purchase by the former of the site of some old saw mills in North Grimsby for the purpose of erecting new public shambles, are practically completed. The site is to cost £3150.

**A Sewer Fatality.**—On Friday last, a lamentable accident occurred in Osnaburgh Street, Regent's Park, which resulted in the loss of two lives. About a month ago, a Stepney contractor, named Robert Montgomery, began to connect the drain of 37, Osnaburgh Street, with the main sewer, running parallel with the Church of St. Mary Magdalen; he was assisted in the work by his brother, Charles Montgomery, and a labourer, named William Chamberlain. In order to reach the sewer, it was necessary to tunnel under a portion of the street, and, owing to the looseness of the soil, parts of the work were shored up. The excavation progressed satisfactorily, and the pipes were laid. While the work of filling in was in progress, the roof of the subterranean passage fell in, and with it a large quantity of earth. The contractor was rescued almost immediately and taken to a hospital. The man Chamberlain was extricated at one o'clock on Saturday morning, but died directly after his rescue. On Sunday afternoon, after forty-eight hours incessant toil on the part of the rescuers, the body of the other victim was recovered.

## Professional Practice.

**Aberdeen.**—New offices are to be erected in Aberdeen for the Scottish Temperance Life and Accident Assurance Company Limited. The new building will occupy the site of the dwelling-house, 154, Union Street, next to the Royal Bank. The site is unfortunately rather narrow, and the architects—Messrs. Jenkins, and Marr, Bridge Street, Aberdeen, have consequently been somewhat hampered from an architectural point of view, but they have made the most of the space at their disposal. The style of the building may be described as free classic. In height it will be 70ft., with a width of 34ft., and it will have a depth to Diamond Lane of 92ft., which will to some extent compensate for the narrowness of the front. The basement will be occupied with cellars and stores, and on the ground floor there will be two handsome shops, with extensive saloons behind. These shops will be on either side of a fine central door, giving access to the upper floors. The door has a graceful fanlight, and it is surmounted by a balustrade. The architectural effect is accentuated by the ornamental gables in which the structure terminates above. On the first floor there are two sets of offices in the front, and one in the back of the building, and they are roomy and well-lighted. In the second floor there is a slightly different arrangement, viz., two offices in the front and two at the back. The third floor and attics will be let as a dwelling-house. On the level of the third floor there is a laundry and a washing-house conveniently situated. Part of the first floor will be utilised as the Aberdeen offices of the Assurance Company, who will leave their present premises at 137, Union Street. The building will be of finely-dressed grey granite. The estimated cost, apart from the cost of the site, is £5000.

**Bordesley.**—The new Imperial Theatre, will, it is hoped, be completed for opening on Monday, October 2nd. Already very satisfactory progress has been made with the work, and the building promises to be a good example of a provincial theatre. The plans have been prepared by Messrs. Owen and Ward. The building has two frontages, one to High Street 104ft., and the other to Clyde Street of 134ft. There are twelve exits from the various parts of the house, communicating directly with the streets, and each section of the building has at least two spacious fireproof staircases in connection with it. The grand hall leading to circle and stalls is approached through three pairs of handsome mahogany and glass doors, and is 25ft. by 20ft., with wide staircases on both sides leading to the dress circle. The ceiling of the hall will be domed and decorated with hand-painted panels illustrative of Shakespear's work, and the wall will be lined with marble in parti-colours, and the floors paved with marble mosaic. The auditorium is 69ft. by 65ft., and the stage 69ft. by 40ft. Both gas and electricity will be employed for lighting purposes throughout. The interior decorations will be principally of fibrous plaster in the Renaissance style, the prevailing colours being cream, blue, and gold, whilst the draperies and upholstery will be in old gold silk. A domed ceiling, with a quaint proscenium front, completes the interior embellishments. The elevation to High Street is in red Ruabon brick, with buff terra-cotta dressings by Messrs. Doulton and Co., the two extreme angles being surmounted by square towers; whilst a gabled pediment adorns the central feature. An ornamental iron and glass verandah, supported on cantilevers, is placed as a shelter over the principal entrances. The circle and gallery are supported on steel cantilevers. There will be a fireproof curtain to the proscenium opening.

**Bradford.**—A new Baptist chapel is to be erected on a site in Carlisle Road. The style of the building will be modified Gothic; it will consist of two blocks, connected at the end farthest from Carlisle Road by a small block containing a kitchen and serving rooms,

while at the south-west corner, abutting towards Drummond Road, will be the chapel keeper's house. Accommodation will be provided for about 800 persons, and the seats will be disposed on the radiating principle. The vestries are arranged at the rear of the building. The baptistry will be in tiles and marble. The school buildings, which form the other blocks, will on the ground floor consist of an assembly hall, infants' school, and twelve class rooms, with library, committee and cloak rooms. Six of the class rooms will be constructed so that they can be thrown into the body of the assembly hall when additional space is required for large meetings. On the upper floor will be ten class rooms, and a lecture hall. The assembly hall will have a gallery round three sides and a small organ chamber. The plans have been prepared by Mr. James Ledingham, architect, of Bradford.

**Bridgford.**—The Friary Congregational Church, West Bridgford, has just been opened. The site is situated at the junction of Musters Road and Millicent Road, and the plans were prepared by Messrs. E. C. and E. R. Sutton, architects, Bromley House. The trustees originally gave instructions for the preparation of designs for a church, hall, and schools, with accessories to form a harmonious group, but it was deemed advisable that the hall and schools should be proceeded with directly, in consequence of the immediate want of accommodation, and these have now been completed. The style adopted was Late Decorated, somewhat freely treated, and the structure is of red brick, with stone facings. A prominent feature of the end directly adjoining Musters Road is a large five-light window, having stone mullions and tracery, flanked on either side by massive piers. The gables are covered with substantial stone copings. The hall has been designed so as to constitute an adjunct to the proposed church. There are four entrances to the hall with lobbies, and its dimensions are 56ft. by 25ft. The building was erected by Mr. W. Maule.

**Bristol.**—The dedication of the vicarage of All Saints, with All Hallows, Euston Road, Bristol, took place on Saturday. The building is constructed of Winterbourne stone with Bath stone dressings, and has been erected at a cost of about £2500, the site accounting for an additional £630. The house was designed by Messrs. Crisp and Oatley, and the builders were Messrs. Walters and Son.

**Clontarf, Ireland.**—A new chancel has been dedicated in Clontarf parish church. It has been erected by Mr. Robert Lidwell, J.P., in accordance with the plans of the architect, Mr. Fuller. It is about 24ft. in depth, and is floored in marble mosaics, a quatrefoil forming the centre piece. About 130 additional sittings have been added to the church by the extension. A kerb stone of red Cork marble has been erected around the Communion table, and the interior of the edifice has been embellished by two stained lancet windows in the Gothic style, with a new Bath stone entrance. The roof consists of pannelled pitch pine sheeting to match the roof of the nave. Eight clergy stalls have been placed within the chancel, and seating accommodation for a choir of forty-two persons has also been provided. The sittings are of pine, and were made in the contractor's workshop. The entire work was carried out under the supervision of Mr. M. A. Partridge. The estimated cost of the work is £1500, of which about £1000 has been already collected.

**Dundee.**—A bronze statue of the Queen is to be erected at Dundee on a site fronting the north entrance to the Albert Galleries. The four panels of the statue are occupied by bas reliefs, which have been excellently treated by the late Mr. Harry Bates, A.R.A. The scene depicted on the front panel is the marriage of Her Majesty and Prince Consort. The second picture shown on the back panel has a local interest, and represents the visit of the Queen

and Prince Consort to Dundee in 1844. It illustrates the reception of the royal guests by the provost and other dignitaries. The third panel shows the Queen distributing medals to the soldiers wounded in the Crimea. The last picture gives a view of the Queen visiting the poor. The pedestal of the statue is at present lying in the yard of Messrs. Bower and Florence, granite monumental sculptors, Aberdeen, ready for removal. The stone selected is Peterhead granite, from Blackhill Quarries, and it has been treated in two styles—fine-axed and dull-polished. None of the panels of the die have been highly polished, so that full value will be given to the high lights of the bronze work. The base course measures 21ft. by 19ft. Three steps, semi-circular on the front elevation, leave a landing, 3ft. 6in. wide, all round the pedestal. The base of the pedestal takes the form of a seat, 10ft. 8in. by 9ft., grooved out underneath to give foot-room for those who may care to sit there. The granite die is 2ft. in height, surmounted by a moulded band 6in. deep. On this will rest the bronze frieze with sculptured work, and above this again will be placed the statue of the Queen. The height of the granite pedestal is 9ft.

Plans and sections of proposed new buildings in Dundee, lodged with Mr. W. Mackison, F.R.I.B.A., Burgh Engineer, were submitted to a meeting of the Works Committee of the Town Council on March 13th, and the following were approved:—Shops and dwelling-houses in Blackness Road, Cherryfield Lane, Constitution Street, Lawson Place, Gibb's Lane, High Street, and Marshall Street; and semi-detached villas in Clepington Road.

A two-tenement property is to be erected by Mr. D. Y. Preston in the village of Downfield, which hitherto has principally consisted of buildings of the villa and cottage type. The building will be of three stories. One tenement will consist of half-flats of three rooms each, while the other will contain half-flats of four rooms each. Each house will have, in addition, a scullery and bath room. Tiled ranges will be fitted in the kitchens, while marble mantelpieces will adorn the public rooms. The staircases, which will be in the centre of the buildings, will have hanging steps, with open well-hole lighted from large cupolas on the roofs. Mr. James Hutton, Dundee, is the architect.

**East Compton.**—An institute has been erected at East Compton, Bristol. It is the gift of Lady Davis, of Hollywood. The institute has cost about £600. It is built of Cattybrook brick with Bathstone facings. The interior and furniture are of varnished pitch pine. The reading-room may be shut off from the room for games. It is fitted with low pressure heating apparatus. The work has been carried out by Mr. T. B. Bradford of Brigstocke Road, St. Paul's. The building has a turret clock with a skeleton cast-iron dial and carved centre, the figures, hands, and outer beads being gilt. The movement is furnished with all the latest improvements, and strikes the hours upon a deep-toned bell, fixed over the dial. The escapement is Graham's, the pendulum governing same being compensated, and of great weight.

**Edinburgh.**—The Church of the Good Shepherd, Murrayfield, which has been erected on a site in the Murrayfield district of Edinburgh, was recently opened and consecrated by Bishop Dowden. The church stands picturesquely on the east side of Murrayfield Avenue, having a grove of trees on its south side and a considerable amount of garden ground around it. It at present consists merely of nave and chancel, with a wing for vestries, &c. Ultimately, a north aisle and organ transept will be added, and a square tower will be carried up over the vestry wing. The nave is entered by a porch at the south-west corner of the building. At the west end is the font, beneath a large six-light window. The nave is treated with the utmost simplicity and consists of five bays with plain barrel wood roof. To the north side is the arcade to the future aisle. The pulpit is in the north-east corner of the nave, and is of oak, with linen fold-panelling on the wall behind. The

west part of the chancel is occupied by the choir, which is one step above the nave. The reredos, reaching 15ft. up from the floor, is in the form of a triptych, the centre panel being carried up above the rest. It is surrounded by a pierced and carved frame, with the dove in a halo of rays at the apex, flanked on each side by angelic figures. At the sides are green stamped velvet wings hanging from iron rods. The colour treatment of the whole is in dull red and gold. In the centre light of the east window is a representation of the crucifixion. The background is filled with diapered lattice glass. The heads of the side lights contain the sacred initials on crowned shields within wreaths. At the base of the window are four covered shields with the symbols of the passion. Mr. R. S. Lorimer is the architect.

**Exeter.**—Before His Honour Judge Wood-fall, at Exeter County Court, on March 8th, A. J. Wilkins, late Clerk of the Works at Devon and Exeter Hospital, brought an action against Mr. Charles Cole, architect, for £68, commission at the rate of 1½ per cent. for preparing three bills of quantities and specifications in connection with the new out-patients department of Exeter Hospital. Mr. Dunn, for the plaintiff, said the agreement to pay the 1½ per cent. was verbal, but was made in the presence of Mr. A. E. Boyce, late secretary to the hospital. Mr. Cole was to receive 2½ per cent. on the estimates, and to pay Mr. Wilkins the 1½ per cent. for making out the bills of quantities. The total estimate was £4550. Some friction arose, and the tenders for the work were annulled, and the scheme was abandoned. Mr. Cole, however, would receive his 2½ per cent. all the same. Mr. Boyce said that owing to the dispute between the parties he invited them in the interest of the hospital work to settle the matter, and he would act as umpire. It was agreed that plaintiff should receive 1½ per cent. on the bills of quantities, but nothing was said about the specifications. Mr. Harris, for the defendant, said Mr. Cole was contesting the action in the interest of the hospital, who would have to repay him if a verdict was given against him. He had paid £50 into court as a reasonable settlement of the claim. His Honour gave judgment for plaintiff for £7 in addition to the £50, this being at the rate of 1½ per cent.

**Isle of Man.**—The Isle of Man Banking Co., Ltd., are erecting, at the corner of Prospect Hill and Athol Street, Douglas, a new head office. It will be in the Renaissance style. The exterior will be executed in finely axed granite, and the exterior of the lobby will be of polished granite of various colours. The basement and ground floor will be occupied by the company, the first floor will be let in public offices, and the upper floors devoted to caretakers' rooms and small offices. The architect is Mr. A. Marshall Mackenzie.

**Levenshulme.**—The new offices of the Levenshulme Urban District Council in Stockport Road, Levenshulme, have just been opened. The building has a frontage of 75ft. to Stockport Road, the front being of Ruabon brick, with Derbyshire stone dressings. A 10ft. wide entrance opens upon an octagon hall, which is 15ft. across. The Council Chamber, and all the offices—including accommodation for the clerk, the surveyor, overseers, and sanitary inspector,—and also a Committee room, are reached from this hall, and behind are the caretaker's house, the stables, sheds, and a town's yard. A wide staircase leads to a large public hall 72ft. by 40ft., provided with two retiring-rooms. The building was designed by the Council's surveyor, Mr. James Jepson, of Stockport, and the total cost has been about £6000.

**London, E.C.**—The new premises which have been recently erected for the London and Westminster Bank, at the junction of City Road and Old Street, are built in the Italian style. As far as the first floor cornice the building is constructed in red and grey Aberdeen granite, and the upper part is in red

brick, with Portland stone piers. The building consists of three storeys. The wall linings of the bank-room are in thick solid Devon marble, and the ceiling is in fibrous plaster. Electric light has been installed throughout the building. The main building has been erected by Messrs. J. Grover and Son, of Wilton Works, New North Road, according to plans prepared by Mr. R. Bennett, of 72, Cheapside; Mr. Scale, of Camberwell, was responsible for the stone carving.

**Lurgan (Ireland).**—Plans for the erection of a new Masonic Hall in Lurgan have been prepared by Mr. Ferguson, architect, of Belfast, and approved by the building committee. The building will occupy a prominent position in Windsor Avenue, where a 60ft. frontage site has been secured. It will be two stories high, and the ground floor will be taken up with a dining room, kitchen, and pantries. The second story will be devoted to a lodge room, as well as ante and retiring chambers and secretarial apartment. The building will be enclosed by an ornamental railing, and the work of erection will immediately be proceeded with.

**Yeovil.**—The new premises of the Capital and Counties Bank, which are being erected at the corner of High Street and Princes Street, facing directly down Hendford Street, will form one of the most imposing commercial premises in the town. The building has been designed by Mr. J. Nicholson-Johnston, A.R.I.B.A., architect, of Yeovil. The style chosen is freely-treated Renaissance, and the material used for the exterior carefully selected Hamstone from the quarries of Messrs. Staple and Trask, at Stoke-under-Ham. The edifice has two stories above the actual banking premises, and above them again, recessed behind a balustraded parapet, is an upper floor, lit by picturesque dormers. The main entrance is on the angle of the two sides, and is built on the sweep, and there are oriel windows over this doorway on the first and second floor. The skyline is broken by quaint gables of old Flemish inspiration, and the well carried up masonry of the tall chimney stack is thoughtfully and carefully conceived, adding considerably to the admirable grouping of the building generally. There is a good deal of capably executed stone carving upon the two fronts, all of which has been done by Messrs. Harry Hems and Sons, sculptors, of Exeter. Beneath the bank itself is the strong room, occupying nearly the whole of the basement. The desks, partitions, and all internal fittings will be in oak. The floors and partitions will be of fireproof material, and the structure will be heated throughout by hot water. Messrs. E. R. Bartlett and Sons, of Yeovil, are the general contractors.

**Improvements at Cromer.**—A select committee of the House of Lords had under consideration, on March 14th, a Bill promoted by the Cromer Improvement Commissioners, to extend the sea wall along the remainder of the front, and to construct a pier 183yds. long for pleasure purposes, at an estimated cost of £45,000. The Bill is to be further considered at the next meeting of the Committee.

**Peterborough Cathedral.**—It has been decided to endeavour to complete the restoration of Peterborough Cathedral before the end of the present century. At a meeting held to consider the matter it was stated that during the last sixteen or seventeen years something like £72,000 had been expended on the building. The west front was still not in a proper state of repair, and about £6000 or £8000 were required to place it in an efficient condition.

**Eastwood Wesleyan Church** was reopened on Tuesday last week, after being closed for about six months for restoration purposes. The work, which is the completion of the original design put forward when the church was built in 1870, consists of the erection of a gallery round the organ loft, whilst the place has been redecorated and relighted with incandescent lamps. The cost of the improvements has been upwards of £800.

## Under Discussion.

### ADVANCES IN ENGINEERING.

Mr. Ewing Matheson, M.Inst.C.E., President of the Leeds Chamber of Commerce, lectured last week before the members of the Yorkshire College Engineering Society on "Recent Advances in Engineering." The chair was taken by Mr. J. H. Wicksteed (President), and there was a large attendance. Mr. Matheson sketched the numerous inventions of recent years which had enabled engineers to carry out works that previously were either impossible or too expensive to be undertaken. Among other advances he mentioned the modern methods of excavation, specially instancing subaqueous tunnels. He also referred to the inauguration of the scheme for impounding the upper waters of the Nile; and alluded to the circumstance, not generally known, that the works on the Panama Canal had been recommenced. It was not at all unlikely that this canal would be finished under American auspices, in preference to the Nicaragua Canal. Reference was likewise made by Mr. Matheson to the advantages and economy of Portland cement. Professor Goodman and Mr. Wicksteed took part in the discussion. In an allusion to the American engines for the Midland Railway Company, it was pointed out that English makers have not such scope for the construction of locomotives as the American manufacturers, because the width and height of the English railway bridges and tunnels are less.

### STAIRCASE PLANNING.

At a recent meeting of the Edinburgh Architectural Society Mr. A. Balfour Paul read a paper on "The Staircase." Mr. A. Lorne-Campbell, the President, was in the Chair. After a few introductory remarks, in which he deplored the prevalent practice of treating the stair as a mere ladder, Mr. Paul quoted Palladio's definition of the essentials of a stair—spaciousness, light, and convenience of ascent. With regard to the first, it was pointed out that sufficient headroom did not constitute spaciousness, there being many great staircases where, though 8ft. or 9ft. of headroom existed, people always crouched in ascending owing to bad scale and proportion. On the subject of lighting from above, there was a good deal to be said for and against the practice. Except as regards the top flights, this system lit the wall, and not the stair, but was economical in the matter of wall lights. With reference to ascent, there were many rules for relation between tread, riser, and baluster, which in extreme cases broke down, such, for instance, as the "tread to be double the riser" rule. The smallness of the modern stair dated from about a century ago when land value in the cities began to rise rapidly. One of the main difficulties in modern stair planning arose from the increase of floor to floor heights, combined with economy of space. Winders in any but circular stairs Mr. Paul regarded as simply mantraps, and circular stairs themselves were not to be recommended.

### WORKMEN'S COMPENSATION.

Mr. James A. Love Tindal, of Glasgow, delivered a lecture on Monday, last week, to the architectural branch of the Glasgow Philosophical Society at the Society's Rooms in Bath Street, Glasgow, his subject being "The Workmen's Compensation Act 1897, so far as it affects builders and architects." Mr. P. Macgregor Chalmers, president, occupied the chair. The lecturer said that the Workmen's Compensation Act of 1897 was the result of the irresistible pressure of public opinion and social progress, which seemed to develop the idea that the State had a paternal responsibility in connection with the relations existing between employers and employed. By that Act workmen were practically insured at the expense of their employers and the trade, and, as a necessary result, at the expense of the consumers of the commodities produced by that trade. So far as the 1897 Act was concerned, the law of negligence might have had no

existence, as a workman coming under the Act was entitled to compensation irrespective of negligence or carelessness on his part, so long as he was not proved to have been guilty of serious and wilful misconduct. The Act was probably the commencement of a system of compulsory restrictions on the freedom hitherto exercised by employers and their workmen, and further legislation extending and emphasising the principles which it promulgated might be expected. Mr. Tindal thereafter took the Act clause by clause, explaining the effect of each, especially with regard to the building trade, and pointed out various conditions which restricted the operation of the Act, particularly that its provisions would not apply unless the building being constructed, repaired, or demolished, exceeded 30ft. in height. A discussion followed, and a vote of thanks to the lecturer concluded the proceedings.

RENAISSANCE PLASTERWORK.

At the meeting of the Edinburgh Architectural Association in the Royal Institution, on March 8th, Mr. Harold Tarbolton read a paper on "Plasterwork of the Renaissance period in Great Britain, and its subsequent phases." Mr. Tarbolton traced the history of plaster decoration from the somewhat isolated attempts of Italian craftsmen to pursue their art in England, and, on the death of their patron Henry VIII., the influx of Germans and Dutch with their strange and sometimes crude displays of decoration, down to the introduction by Inigo Jones of the later and much modified Italian modes. The starting point of all plaster work was the moulding of old ceilings, which might be divided into two kinds—those with enrichments modelled in a cast from an impressionable medium such as clay, and those modelled *in situ*. Having described the two processes, Mr. Tarbolton remarked that no beautiful detail and delicacy of execution, in plaster work in any other craft, could condone any offence against proportion. Let them take all that was best in conception from the old work; they had magnificent examples within reach. He wished especially to emphasise the importance to architects of a personal and practical knowledge of the crafts. They could not fully understand the capabilities and limitations of

any material until they knew its nature and ways of working. Until they had handled clay and worked with hawk and tool in hand and modelled *in situ*, it was next to impossible to appreciate the subtleties of the craft in plaster work. Architects should at least know thoroughly the interpretation and manipulation of one or more crafts in their endeavour to catch the spirit and vigour of the earlier Renaissance workmen. A great work has been done in the School of Applied Art in Edinburgh in familiarising students with materials and their workings, and he was confident they would see the result in the work of the next few years. The paper was illustrated by lime-light views of ceilings in England and Scotland.

VALVES OF STEAM ENGINES.

The monthly meeting of the Belfast Mechanical and Engineering Association was held in the Museum, College Square North, on the 28th ult., the president (Mr. George Elliott) being in the chair. Mr. W. D. Ferguson read an interesting paper on "Valves of Modern Steam Engines." Beginning with the common D valve, the author described the great variety of different settings which may be effected with this valve, and their influence on the diagrams. It was one of the earliest types of valve, and is still the most useful owing to its extreme simplicity. In order to give a quicker opening to steam, the D valve is made with a passage from end to end—called a "Trick" passage after its inventor—which for the same port opening reduces the travel by one half, and is very useful in locomotive and marine work when working "linked up." The double-ported D valve has practically a trick passage for both steam and exhaust. Meyers' valve in its three forms was next described. Corliss valves are made both single and double-ported, and are usually fitted four to each cylinder—two steam and two exhaust—thus allowing any one valve to be altered without affecting the others. The steam valves of this type are for a portion of each stroke disengaged from the motion, and this allows the governor to find its proper place while thus free. The valves of a number of high-speed engines were described, including those of the Westinghouse, Willans, and Bellis type, and also the valves of the

Wheelock engine. Double-beat crown valves, which are largely used on the Continent, are considered superior even to Corliss valves for clearance and ease of working. As the friction of an engine is practically constant for any load, the latter is a very important consideration. The paper was illustrated by means of a number of excellent diagrams, and was followed by an animated discussion.

COMING EVENTS.

Wednesday, March 22.

EDINBURGH ARCHITECTURAL SOCIETY.—Open discussion. Mr. W. N. Cumming will open the debate, Mr. T. R. Paterson moving the previous question.

SOCIETY OF ARTS.—Ordinary Meeting at 8 p.m.

SANITARY INSTITUTE.—(Lecture and Demonstrations for Sanitary Officers).—Inspection and Demonstration at the East London Water Works, Lea Bridge, Clapton, at 3 p.m.

LIVERPOOL ENGINEERING SOCIETY.—Mr. H. C. Darbishire on "Machinery in Use in First-Class Roadstone Quarries." 8 p.m.

Thursday, March 23.

SOCIETY OF ARCHITECTS.—Meeting at 8 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers).—Demonstration of methods of dealing with diseased meat, in the Parkes Museum, at 8 p.m., by Dr. W. A. Bond, M.A., D.P.H.

INSTITUTION OF ELECTRICAL ENGINEERS.—Mrs. Ayrton on "The Hissing of the Electric Arc," illustrated by experiments. 8 p.m.

ROYAL INSTITUTION.—Mr. William Poel on "English Play-houses in the Fifteenth, Sixteenth, and Seventeenth Centuries." 3 p.m.

Friday, March 24.

CENTRAL SCHOOL OF ARTS.—Mr. Starkie Gardner on "Metal Work." 8 p.m.

ARCHITECTURAL ASSOCIATION (Discussion Section).—Mr. L. Jacob on "Arbitration." 7 p.m.

Saturday, March 25.

INSTITUTION OF JUNIOR ENGINEERS.—Visit to the Testing Station of the British Fire Prevention Committee at Hanover Gate, Regent's Park, London. 8 p.m.

ROYAL INSTITUTION.—The Right Hon. Lord Rayleigh on "The Mechanical Properties of Bodies." VII. 3 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers).—Inspection and Demonstration at the Sutton Sewage Works. 3 p.m. Conducted by Mr. C. C. Smith.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to houses, Mortonhall-road and Grange House. Mr. H. O. Farbolton will lead.

Monday, March 27.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers).—Inspection and Demonstration at the Metropolitan Cattle Market, York-road, N. 3 p.m.

INSTITUTION OF ELECTRICAL ENGINEERS.—8 p.m.

Wednesday, March 29

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers).—Demonstration in the Parkes Museum of Book-keeping as carried out in a sanitary inspector's office, by Mr. A. Taylor. 8 p.m.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

AUDENSHAW.—For the pulling down and rebuilding of the "Hansing Gate" Inn, for Messrs. Chesters' Brewery Co., Limited, Ardwick, Manchester. Messrs. J. H. Burton and J. A. Percival, architects, Ashton-under-Lyne:—

J. Lord	£1,380	C. Evans	£1,270
F. Woolley	1,347	J. Thornley	1,285
Fitton and Bowness	1,325	T. Dean	1,256
J. Gibson and Son	1,300	H. Fielding	1,250
E. Marshall	1,298	J. Ridyard, Ashton-	
Z. Pike and Son	1,290	under-Lyne (accepted)	1,225

Plumbing.  
G. Burrows ... £119 0 0 H. Rigley ... £107 0 0  
G. H. Coop ... 111 0 0 P. Wills ... 102 10 0  
H. Hobson ... 107 12 6

BURTON-ON-TRENT.—For the execution of sewerage works, for the Corporation. Mr. G. T. Lynam, Borough Engineer, Town Hall, Burton:—

George F. Tomlinson, City-road, Derby ... £9,442  
BURTON-ON-TRENT.—Accepted for the extension of electric light buildings, for the Corporation. Mr. F. L. Ramsden, engineer, Gas-works, Burton:—

L. T. Varlow, Burton ... £3,324 18 5  
CARSHALTON.—For building dwelling-house and shop at Carshalton, Surrey, for Mr. Arthur Gilham. Messrs. Morgan, Baines and Clarke, architects, Sutton:—

Burrage	£1,457 0	Evans	£1,148 0
Shopland	1,417 0	J. and H. Neale	1,139 0
Potter	1,300 0	Freeman	1,010 0
Blaxton	1,269 17		

CHIPPENHAM.—For the erection of technical schools, for the Education Committee. Mr. R. E. Brinkworth, architect, Chippenhams, Wilts. Quantities by Messrs. Amor and Underwood, of Bath:—

Hayward and Wooster	£7,599 10 0	Downing and Rudmann	£7,071 15 8
Smith and Light	7,330 0 0	William Webb	6,363 0 0
J. Long and Sons	7,290 0 0	George Moore	6,338 5 0

CORK.—For the supply of pipes and specials, to Corporation Waterworks:—

Robert McLaren	£1,421
Stanton Ironworks Company, Limited	1,418
McFarlane, Strang and Co.	1,379
Biggs, Wall and Co.	1,307
Thos. Spittle, Limited	1,287
Henry R. Merton and Co., Ltd., London*	1,260
Chas. Gordan and Co.	1,218

\*Accepted.  
GOSPORT.—For the erection of a grocer's shop, with off-licence and private dwelling-house attached, at the junction of Sydney and Elmhurst-roads, for Messrs. H. J. and W. A. Hobbs. W. H. Fry, Esq., A.M.I.C.E., architect and surveyor:—

Lane and Son	£1,275	Dash	£1,089
Jno. Croad	1,150	Lear	1,065
Johnson	1,091	R. M. Middleton & Co.*	950

\*Accepted.  
HARROW.—For road and sewer, Parkfield Estate, Harrow, for Mr. A. Sykes:—

Dupont	£2,050	Wimpey	£1,799
Neave	1,911	Killingback	1,797
Adams	1,893	Free and Son	1,760

J. Anley and Son ... 14,782

MIDSOMER NORTON.—For erection of Elementary  
Schools at Midsomer Norton, Somerset, for the National  
School Managers, to accommodate 300 children. Mr.  
William F. Bird, M.S.A., &c., architect, Midsomer Norton.  
Quantities by the architect:—  
Hughes and Weeks ... £3,887 0  
T. H. Brown ... 2,565 J. H. Tovey ... £2,000 0  
Joseph Bird ... 2,150 H. E. Perkins ... 1,998 10  
A. W. J. Catley ... 2,150 Coles Bros ... 1,960 0  
Wm. Tovey ... 2,125 0 Valentine Keeling ... 1,923 0  
Architect's estimate, £2,005.

SANDBACH.—For the erection of workhouse infirmary,  
Arlod, for the Congleton Union Guardians. Mr. A. Price,  
architect, Elsworth, Sandbach. Quantities by architect:—  
Cooke ... £5,996 Worrall ... £4,946  
Bousfield ... 5,800 Stringer ... 4,895  
Barratt and Gibson ... 5,680 Smith ... 4,735  
Ryland and Son ... 5,150 Birchall Bros., Mid-  
Stebos and Son ... 5,123 dlewich\* ... 4,650  
Goodwin ... 5,100 \* Accepted.

SOHAM.—For building new house and stables for Mr.  
C. Morbey. Mr. John Flatman, architect, Newmarket.  
Quantities by Mr. Wm. Wren, Cambridge:—

	House.	Stables.	Total.
Shillitoe ...	£7,800	£1,450	£9,250
Wm. Saint ...	6,790	1,190	7,980
H. J. Linzell ...	6,180	976	7,157
Kerridge and Shaw ...	5,999	998	6,992
J. G. Cowell ...	5,965	958	6,923

SOUTHAMPTON.—For building licensed house and two  
private houses adjoining Bellemoor Estate, Shirley, for  
Messrs. Wm. Cooper and Co., Limited. Mr. William Bur-  
rough Hill, architect, Southampton:—  
Jenkins and Sons ... £1,974 J. J. Udall and Co. ... £1,877  
Playfair and Toole ... 1,897 Henry Cawte\* ... 1,772  
H. Stevens and Co. ... 1,877 \* Accepted.

STOCKTON-ON-TEES.—For erecting new premises for  
Messrs. D. Hill, Carter, and Co. Limited, Stockton-on-Tees.  
Mr. Eugene E. Cielhan, architect, St. Nicholas-chambers,  
Newcastle-on-Tyne:—  
Joseph Howe and ... Crages & Benson,  
Co. ... £2,900 0 0 37, Hume-st.,  
John Davison ... 2,605 17 11 Stockton-on-  
Albison Bros. ... 2,600 0 0 Tees (accepted) £2,420 0 0  
R. Blackett and ... G. T. Manners ... 2,345 0 0  
Son ... 2,595 0 0 A. Atkinson and  
Perks and Son ... 2,434 0 0 Co. ... 2,232 11 9

SUTTON.—For building twelve houses, and dwelling,  
house and shop, at Sutton. Messrs. Morgan, Baines, and  
Clarke, architects, Sutton:—  
General Builders' Sup- ... W. Smith and Son ... £5,990  
ply, Limited ... £8,400 Blaxton ... 5,510  
Potter ... 6,936 Freeman ... 5,410  
Shopland ... 6,700 Burrage ... 4,896  
Wells ... 6,087 Gregory ... 3,650  
J. and H. Neale ... 5,990

WALLINGTON.—For the erection of three cottages at  
Park Gate-road, for Mrs. Chapman. Messrs. R. M. Chart  
and Son, architects, Union Bank-chambers, Croydon:—  
S. J. Evans ... £1,460 Huntley Bros. ... £1,220  
G. Burrage ... 1,450 Card ... 1,110  
E. J. Burnand ... 1,230 Howe and White\* ... 1,100  
\* Accepted.

WALSALL.—For the erection of Board Offices, Pleck-  
road, for the Union Guardians. Mr. H. E. Lavender,  
architect and surveyor, Walsall:—  
Hopkins ... £3,906 Tildesley ... £3,409  
Hughes ... 3,690 W. Wistance\* ... 3,497  
Mallin ... 3,649 Hemming ... 3,392  
Gough ... 3,590 Craddock ... 3,285  
Inslay ... 3,590 Hall ... 2,930  
Guest and Sons ... 3,590 \* Accepted.

WALTON-ON-THAMES.—For the construction of a  
brick groyne, near "Pier Hotel," for the Coast Development  
Company, Limited. Mr. H. W. Gladwell, surveyor, 5, Cres-  
cent-road, Walton-on-the-Naze. Quantities by the sur-  
veyor:—  
G. Double ... £2,030 Mackenzie, Clacton-  
Moron and Son ... 1,140 on-Sea\* ... £1,120  
\* Accepted.

[Surveyor's estimate, £1,050.]

## METHODS USED IN PRODUCING TERRA-COTTA MOULDINGS.

BY WILLIAM REID.

THE term "terra-cotta," as generally understood, is, perhaps, somewhat misleading, for the general acceptance of the term has reference to hand-made work only in contra-distinction to work produced by mechanical means. This is more particularly noticeable when referring to a brick building, and remarking on the amount of "terra-cotta," there is in it, the allusion generally applying to those parts only which are more or less covered with enrichment. But in reality any earth that has been fired is terra-cotta. The term is derived from the Italian, meaning cooked earth, and the French *terre cuite* has the same significance. In the finer classes of earthenware, when, for glazing purposes, it is necessary to fire the goods twice, the first firing is called "biscuit," which is really the same as the French *bis-cuite*—twice cooked.

In the few examples illustrating this article both bricks shaped by hand and by machinery are dealt with, though the latter are generally

detachable, so that, when worn or broken, they may be easily replaced. The wearing on the knives is much greater towards the mouth than at the other end on account of the increased resistance of the clay at this part.

The clay issues in one continuous strip from the die over the rollers and on to the cutting table, where a series of vertical wires will be seen, placed at regular intervals apart, these spaces being equal to the width of a brick. By pulling the handle H the vertical plate P is drawn across the cutting table, pressing the strip of clay against the wires, and so cutting it into bricks. The clay does not issue very rapidly from the die, so when a length equal to the range of wires has been made, this is cut and pushed by hand on to the cutting table, thus allowing a clear space between the table and the die for the issuing strip of clay to keep moving. If reference is made to the drawing (Fig. 2), an upright wire stretched on an iron bow will be noticed between the first and second rollers next to the machine. This is pulled across by the handle shown on the opposite side, cutting a portion of the strip of clay already described. Perhaps it may not be amiss to mention here that all ordinary bricks made by this machine are termed "wire cut," deriving their name from the manner by which

the required brick. Into this box the brick is put, and a top plate of the same shape and fitting exactly into the box is set in motion, descending on the brick with a force of between twenty-five and thirty tons, stamping it with the manufacturer's name, consolidating the particles of clay in the brick, and improving its general appearance. Mitres or angles—that is, when the moulding has to be constructed so as to turn a corner—must be made by hand. This is simply done by cutting two bricks, roughing the joining parts with a fork, damping with a wet sponge, and sticking together.

The brick is now finished, and is wheeled away to the drying shed to become thoroughly dry before being fired. From this brief description it may be gathered that it is quite possible to manufacture a great variety of mouldings by mechanical means, and hence there is no difficulty in understanding how it is that the type of mouldings generally found in the cheaper class of brick buildings presents a remarkable similarity in whatever part of the country they may be found. Naturally, when an architect is limited as to the cost of a house he will select from the catalogues of brick manufacturers such ornamentation as is within the range of the cost allowed, and

FIG. 1. STRING COURSE OF MACHINE-MADE MOULDINGS. MOULDING TO BE MADE BY HAND.

FIG. 3. EXAMPLES OF

FIG. 4. APPARATUS FOR MAKING PLASTER MODEL OF MOULDING. FIGS. 5 AND 6. DIFFERENT STAGES OF PLASTER MOULD.

understood as "moulded bricks." The string course (Fig. 1) is composed of a series of 3in. moulded bricks, all of which have been made by machines. For the present merely a rough suggestion of the machinery employed in their production can be given, but sufficient may be said to give a fair idea of the process. When the clay has been properly tempered, that is, thoroughly ground and mixed with water till the mass is in a workable state, it is pressed by means of a screw adjustment through an aperture—called the die—formed to the shape of the required moulding. This die consists of a wooden framework fitted to the mouth of the pug—the apparatus containing the prepared clay—and illustrated at Fig. 2. In the drawing the wooden die itself is not seen, as it is fixed within the outer framework of iron, only the little piece that has been added to form the particular shaped brick—a bull nose—is visible. The pug is given in section, showing the screw arrangement of the knives which force the clay through the die. These knives are made

they are made. All dies are lined with good moleskin, the object of which is to give a fine surface to the clay, and also to prevent wear and tear of the die itself. This would not take long in doing, for, it can be very readily understood, that the continual friction of clay, more or less coarse, over a wooden surface, or even over a metal one, would not take long to wear it out of shape. The moleskin not only protects the die, but acts, as already said, in putting a face on the clay. The moleskin itself will, of course, be as susceptible to wear as any other material, but it can be readily replaced when worn out, and, to prevent undue wear, the inner face of the die is kept continually lubricated by a minute stream of water, which enters by the pipe shown on the drawing (Fig. 2). In continual use the moleskin may last from three to four days.

This completes the first process of moulded bricks, the next being their passage through a press which gives them a final finish. This press is either worked by steam or hand power, and contains a metal box made to the shape of

make the most of what can be had at a much less price than if he were to design string coursing of his own, the result of which would be that all such work would have to be hand made from plaster moulds.

In most firms the making of terra-cotta from plaster moulds is the work of two distinct branches of skilled labour. The first is the model and mould maker, the second the presser and finisher, and these, in large works, are again subdivided. The model-maker, or the one who makes the model or pattern from the architect's design, confines himself to this branch alone. When a model has been made the mould maker takes the model in hand and makes the mould. The mould is then taken to the presser, who fills it with clay, passing on the clay pressing to the finisher, who puts the necessary finishing touches to the work. To more clearly understand these different operations let us begin at the beginning when the draughtsman has handed the model-maker a full-sized sketch of the required model. This drawing, by the

way, is made to a specially constructed scale. Clays contract both during drying and firing and different clays will have different contraction. Hence it is necessary to ascertain beforehand the difference in size between a mass of clay when in its soft and ductile state and the same clay after being converted into terra-cotta. This shrinkage may vary from  $\frac{1}{4}$  to  $\frac{1}{2}$  of an inch to the inch, and corresponding allowance must be made when constructing the scale. Thus, if the shrinkage is  $\frac{1}{4}$ , a 2ft. clay rule will measure a length of twenty-six standard inches. The draughtsman, then, makes his drawing from the architect's design using this enlarged scale. From this drawing the model-maker makes his model. It must be at once apparent, however, that the process of making a model will vary with different classes of models; hence the description given here of how the models, and a moulding such as is illustrated at Fig. 3, must be assumed as being typical only of this class of work. An outline of the moulding is first traced on a piece of sheet zinc. This is cut out with scissors and tacked on to a framework called a "horse" in the manner shown at Fig. 4. For heavy mouldings the model is not made of a solid piece of plaster, which would be both needless and wasteful. A core of bricks or clay is usually formed in the manner shown in the illustration, and it will be seen that, by pouring the mixed plaster over this and repeatedly passing the horse over the plaster, a moulding will be formed of the required shape. When this is done the moulding may be taken off the bench, the top of which is usually a heavy slate slab, and the bricks and clay forming the core picked out. The model has then only to be sawn to a convenient length to be ready for the mould-maker.

This craftsman sets the model on his bench and begins work by laying a narrow strip of clay along the edges of the face he intends to commence with. This is shown at Fig. 5. The space surrounded by the clay wall is then thoroughly greased, the grease being simply soft soap which has been boiled in water or boiled in oil. The plaster is then applied and trimmed up to the shape shown at Fig. 6.

(To be concluded.)

## THE PLASTERERS' DISPUTE.

NOTHING very striking has happened since our last report in connection with the plasterers' dispute. It seems to be going on without any attempt on either side to bring it to a head. On the 14th inst. the twenty-three foreign operatives who had been imported from Brussels, were induced by Mr. Hennessy and his executive to throw up their engagements, and return to their native lands. It is stated that they came over to England under a misapprehension as to the real state of affairs, misrepresentations having been made to the unions of which some of them were members. They were promised good pay, but were to work fourteen hours instead of nine. To send them back cost the Union over £70. At the beginning of last week, a circular was issued by the Council of the Masters' Association intimating that they had decided to summon district or local meetings of master builders "for the purpose of a thoroughly strong organisation throughout London, for dealing with the present dispute." A meeting of the Central Association of Master Builders of London was held, and lasted some three hours, but it was adjourned until the end of the week, and no statement of what had transpired was given to the press. It has been ascertained, however, that a resolution was passed pledging the employers to continue the contest until the Union promised to discontinue unreasonable practices.

Mr. Deller also issued a circular at the beginning of last week, which stated that in the fifty-six districts more or less affected, the Plasterers' Association has upwards of 10,000 members, and of that number only 2415 had reported themselves locked out; nearly 500 of these have, however, found work elsewhere, and he stated that the number of men unemployed was decreasing each day. He also stated that

the Amalgamated Society of Engineers was taking a vote of its members as to whether they were prepared to levy themselves on the plasterers' behalf, and whether the subscription should be one penny or twopence per week. In either case the amount would reach a good sum, as the Amalgamated Engineers are over 80,000 strong.

The Secretary of the London Building Trades Council wrote to an evening paper stating that he was desired to ask that all executive councils, or managing bodies, connected with the building trade will adopt such measures as will prevent their members from being induced to assist the employers by executing, or assisting in executing, any portion of the work which would, under ordinary circumstances, and were no dispute existing, be done by members of the National Association of Operative Plasterers.

At the end of last week the position had undergone no change, and so far as can be judged from appearances at present, the dispute may go on for weeks. On the 16th inst. the officials of the Plasterers' Union stated that although the number of men locked out had increased, yet, as many had found employment with non-federated masters, only about 2000 men would remain on the funds of the union; but the amount of strike pay would exceed that paid out last week, as most of the men will receive a full week's pay.

At Newcastle, out of fifty-seven men who were on the books of the Society on Tuesday last week, nine had accepted situations offered in Glasgow and other parts of Scotland. At a meeting of the Yorkshire Federation of Building Trade Employers, held at Scarborough on the 16th, reports from various districts handed in were considered satisfactory. The Scarborough branch of the masters' association is the only one which has not locked out its men. The masters say that most of the plasterers in that town are bricklayers, and there are only twenty-three plasterers in the town who are Union men. A number of men have left Leeds, and obtained work in other towns. A Birmingham paper says that so far as that city is concerned the dispute appears to be gradually dying out. It is pointed out that in Birmingham the points objected to do not arise in any serious form, and consequently it is thought the lock-out will soon be at an end.

In Liverpool it seems that of about 500 men originally affected only about 100 are now out of employment, and a good many non-society men have come out in the meantime in sympathy with the others.

At a meeting of the executive of the Central Association of Master Builders, held at the offices in Bedford Street, Strand, last Friday, the Secretary stated that he was unable to give any information as to the policy the employers intend to pursue. Mr. Deller says that in addition to the strike pay of 15s., each member locked out will receive about 12s. extra from the special levy fund. According to the returns issued by the Union on Saturday last, close upon 3000 men have been locked out, and about 1800 have signed on for strike pay. The special levy is expected to realise £1500 every week, and the Union officials state that this sum will be sufficient to provide for all the men who are likely to be thrown out of work.

Altogether matters are not in a very exciting condition, and most likely a few hours' quiet conference between the employers' and men's delegates would settle the dispute. It seems a pity, with the building trade so busy, that such a conference should not be held at once.

**The Masons at Penrith** struck for an increase of wages from 7½d. to 9d. per hour, but have accepted 8½d., and returned to work. The builders' labourers are now on strike for an advance from 4½d. to 6d. per hour.

**Paviors' Wages.**—At a recent meeting of the Boyton District Council a letter was read from the Secretary of the Operative Masons' and Paviors' Society, applying on behalf of the paviors of the Council for an increase in their wages. It was unanimously agreed to advance the paviors' wages from 8d. to 8½d. per hour as requested.

## Trade and Craft.

### VETROPAKE.

This material is a new wall decoration which, it is claimed, has the advantage over fresco of being executed in a permanent manner, and brings into play all the charms and delicacy of the artist-work, while the breadth and brilliancy of mosaic is preserved. Vetropake is made of a special plastic body and moulded into the required shapes to allow of being dealt with in larger pieces than the tesserae used in glass Mosaic, enabling more detail and delicacy to be put into the flesh, for instance. The work is fired at high temperature and fixed *in situ* in cement of a special character. The Inventors of this method are Messrs. C. Woolliscroft and Son Limited. For the purpose of lining unsightly walls at a comparatively low cost they have also invented a special surfaced tile called "Fresco" Tiles, these tiles being unlike the ordinary glazed tiles in so far as they present a dead mat surface. They can be produced in numerous colours and to any design. They can be cleaned down at any time with water, as their colour is fired. They are fixed upon the wall in cement. The firm have also made arrangements for undertaking and carrying out church decoration in stained glass, carving, glass mosaic, ceramic mosaic for flooring, sculptured decoration and mural decoration, both in tempera and in oil (where conditions are suitable to the latter). Iron work in Screens &c., will also be dealt with.

### AN AMALGAMATION.

We are asked to announce that the two businesses of Hendry and Pattisson, of Marlborough Mews, Oxford Street, Heating and Ventilating Engineers and Makers of "D. O. Boyd's" patent warm air grates and stoves, and of E. Farrar and Co., late of 69, Berners Street, W., casement makers and art metal workers, have been amalgamated and incorporated under the Companies Acts, and will henceforth be carried on jointly under the style of Hendry and Pattisson Limited. The works and offices of the company will be at 4, Marlborough Mews, Hills Place, Oxford Street, London, W., to which address all communications should be sent. We are informed that Mr. John Hendry will be the managing director, and Mr. Pattisson and Mr. Farrar have also joined the board. This is evidence that both businesses will receive the care and attention of those who have the largest stake in them.

## Masters and Men.

**The Annan painters' strike** is settled, and the advance of ½d. per hour is to take effect from May 1st.

**Paisley Foundry Labourers have struck** because they are not satisfied with the quantity of refreshment allowed them.

"**Union Smashing in Sweden**" is the title given to the following paragraph in the "Daily Chronicle" of March 15, sent by their Stockholm correspondent:—"Our Swedish Radicals are fighting for the right of combination. The trade unions are threatened by the employers, especially in the northern timber trade districts. The sawmill owners have given notice to their workmen to leave their union or their situations. The employers say this action is not directed against the right of combination, as they will allow their hands to form local unions, but against the Socialist leaders of the present union. This is nonsense, because a local union at one place not federated with others can never be strong enough to enforce any of its demands. The fact is that the mill owners are afraid of the increasing strength of trade unionism in this country. An interpellation of the Government on the treatment of the unionists received no satisfactory answer. A big lock-out is not unlikely."

## Builders' Notes.

**The Conservative Club, Prestwick,** now in course of erection (Mr. James A. Morris, of Ayr, architect), is being ventilated by means of "Cousland's Improved Climax" patent, direct-acting, invisible roof ventilators, supplied by the "Climax" Ventilating and Heating Co. Ltd., 93, Hope Street, Glasgow.

**Prices of Tiles.**—Messrs. Maw and Company Limited, Benthall Works, Jackfield, Shropshire, announce that the prices of tiles have been advanced as follows:—Glazed earthenware, 6d. per yard; plain enamels, 9d. per yard; rough surface enamels, 9d. per yard; one colour embossed, 1s. per yard; painted majolica, 1s. 3d. per yard; plain floor tiles, 3d. per yard; white vitreous, 9d. per yard.

**The Derby and District Master Painters' Association's** held its annual dinner on the 11th. Mr. Geo. Potter (president) occupied the chair, and Mr. Marshall (Nottingham), in proposing "Success to the Derby and District Master Painters' Association," said he had great pleasure in meeting the members from Derby. Speaking of their association, he was pleased to find it improving, and at the same time growing. The object of the Association was to help each other, and do away with unfair practices. Not so long ago one firm tendered for some work, offering to carry it out for £600, while another firm tendered £300 for the same. He did not know whether one man would have worked at a tremendous profit or the other at a loss, but the association existed to put down that kind of thing. He went on to compare the trade in Derby and Nottingham, and very cordially wished the Derby branch success. The chairman responded, and other toasts followed.

**Building Trades Social Assembly.**—The first annual assembly of the building and kindred trades of Stonehaven was held in the Town Hall on Friday evening. There was a very large gathering. Dancing commenced at eight o'clock, and at eleven o'clock the company adjourned to the Upper Hall, where supper was served. Commissioner Ross occupied the chair, and gave the toast "The Town and Trade of Stonehaven." In regard to the building trades and the number of buildings, he remembered when evidence was taken about bringing a railway to Kittywake, it was stated that the rate of building in Stonehaven was about three houses in five years. To-day they built as many every month almost. No doubt there was a great future for Stonehaven, for very few places had its beauty and natural adaptability. Mr. Gregory, in reply, said that he thought they had reason to congratulate themselves on the trade that had been done for the last ten or twelve years. Their Chairman had done a good deal in building houses, but there was a class of houses he had neglected—namely, workmen's houses—and he might turn his attention to that.

**Dispute at the Perth Water Works.**—Several meetings of the Water Works Committee of the Perth Water Commission have been held to consider the concrete work contract at the new Engine-House. A letter from Messrs. L. and W. Macdonald, Inverkeithing, intimating that they offered to finish the Water-House to the Commission's entire satisfaction, and to make a hole outside the wall for the pumps working for the sum of £135, led to considerable discussion at one of meetings. The committee were of opinion that Messrs. Macdonald were not entitled to any additional sum for carrying out their contract according to the specifications, and they accordingly resolved to decline to entertain their offer, and instructed the Clerk to intimate to them that unless they proceeded with their contract to the satisfaction of the architect within three days, the Commissioners would carry out the work themselves, reserving all their claims against the contractors. Mr.

James Smart, architect, stated that since restarting the work, with the exception of making a hole outside the walls for the purpose of pumping, nothing had been done, and that there was only one man on the job. He further reported that the contractors refused to take out the bottom of the concrete work, which he had condemned as unsatisfactory. The meeting thereupon resolved to take the work out of their hands, and gave the architect instructions to give the contractors three days' notice, according to the conditions attached to the specifications. The contractors' solicitors have written protesting against the concrete work being taken out of their client's hands, to which the Commissioners have replied that they were obliged to do so, owing to their client's refusal to complete the work, and they hold the contractors liable for all the loss and damage they have been put to. It was also reported that workmen had been employed to complete the contract, under the supervision of the architect, and that the work is now rapidly proceeding.

**Claim for Damages for Personal Injury.**—At the Norwich County Court, on March 13, William Edwards, carter and publican, Norwich, sued Mr. O. H. Rice, builder, Norwich, for damages for personal injury, the claim being for £50. Mr. Reeve, for the plaintiff, said the action was brought to recover damages sustained by the plaintiff on January 21st, through the alleged negligence of the defendant in not constructing a gable end of a house with proper care. On January 20th and 21st, this gable was being built up while a strong wind was blowing. Edwards contracted with the defendant to carry bricks for him for the purpose of the erection of the house. On January 21st he carted three loads of bricks there; when he delivered the fourth he was told by the foreman, the defendant's brother, to move his cart to a particular part of the ground, near the gable end to unload. Whilst that was going on the top part of the gable was blown down, or fell down, on the plaintiff, striking him on his head, and injuring his eye and thigh. A man of the name of Cawdron was also contracted with to deliver bricks, and delivered a load just before the plaintiff's fourth load. Cawdron noticed the gable moving with the wind, and actually called the attention of the foreman to the dangerous position in which it was standing. The gable was not in any way shored up by scaffolding, as would certainly have been a prudent step. Plaintiff was called, and bore out Mr. Reeve's opening. Dr. Mills described the injuries which the plaintiff had received, which were of a rather serious character. Mr. Eversley, for the defendant, urged that the claim was greatly exaggerated, and in any view of the case the plaintiff was not entitled to recover anything like the amount set down. As regards the general health of the plaintiff, he was quite sure, he would soon recover. A brick carter's cart was a pretty tough object, and the fall of a few bricks upon it would not hurt it very much. At any rate, only £1 had been asked for damages. Mr. Eversley commented on particulars of the claim, and submitted that there had been no negligence on the part of Mr. Rice himself or of his servants, but that the accident was due to the sudden increase of the wind. As he would prove, the wind caught a number of deals, and hurled them against the interior of the gable, and so brought it down. Men who had been at work on the erection of the house, testified that they observed nothing in the appearance of the gable to show that it needed to be shored up. Mr. Stowers, builder, of Sprowston Road, said the cause of the accident was a sudden gust of wind, which blew some deal boards from the scaffolding around an adjacent chimney in course of construction. These first hit the open rafters of the roof of the house, and then the gable, causing the latter to fall outwards. The defendant's brother, who was the foreman, denied that his attention was called to the shaky condition of the gable. His Honour awarded judgment for the plaintiff, with £22 and costs.

## Surveying and Sanitary Notes.

**The Lincoln City Council** has resolved to relay the carriage way in Melville Street with granite setts, at a cost of £1070.

**Lichfield City Council** applied to the Local Government Board for a further loan of £4000 for works of sewage disposal. An inquiry was held on Tuesday last week respecting the application, at which the inspector said that the Local Government Board did not like works to be undertaken and partially carried out before the loan for them was sanctioned, and the Corporation must be prepared to face the responsibility of making alterations to meet the Board's requirements.

**Cragie Outfall Sewer.**—The measurement of the work executed by Mr. Girrity, contractor, in connection with the construction of the outfall sewer for the Craigie district has now been considered. The Burgh Surveyor explained that he had tested the work, and caused several defective parts to be properly executed by the contractor, and that he was now satisfied with the execution of the contract; and the Work and Paving Committee of the Police Commission, in accordance with a recommendation of the Sub-Committee, have ordered payment of the balance of £313 12s. 7d. due the contractor.

**An Insanitary Area.**—Dr. A. Wynter Blyth, medical officer of health for Marylebone, in his last annual report, states that repeated notices, repeated summonses, and frequent inspections, having failed to effect any permanent improvement in the insanitary area comprising Nightingale Street, Stamford Street, and part of Salisbury Street, Lisson Grove, Marylebone, the local Vestry, at his instance, have urged the London County Council to deal with the area under part one of the Housing of the Working Classes Act. The area is about 7500 square yards; the majority of the houses have only four rooms; and the rateable value of the property is £800.

**Southport Sewage.**—Mr. James Mansergh has submitted a report to the Southport Corporation in reference to the sewage disposal of the borough. In a previous report he set out a scheme of chemical precipitation, but at the same time called attention to the bacterial methods of sewage treatment. After an investigation into the present position and development of the bacterial process in England, Mr. Mansergh now states that he has no hesitating in recommending it to the Southport Corporation for adoption. The treatment he advises is that known as Mr. Dibdin's, for the adoption of which he considers the conditions at Southport are very favourable. The sewage is domestic in character, and there are no injurious manufacturing wastes to be dealt with, whilst the outfall at Crossens discharges into the sea, and twice a day the tide covers the outlet. If therefore the floating and suspended matters are all practically taken out of the sewage, and the organic constituents changed into forms which can be dealt with harmlessly by fully-oxygenated water like that in the sea, Mr. Mansergh considers sufficient would have been done. In a previous report Mr. Mansergh recommended a pumping plant at the Crossens outfall. This proposal he retains in addition to the bacterial process. The total cost, with five beds, is estimated at £54,000, and annual working expenses, £825. Omitting the five beds, and the cost is given as £35,000, and annual working expenses £775. The cost of the scheme of chemical precipitation was estimated at a capital expenditure of £32,200, and the working expenses at £2240 per annum. —The sewerage committee, who have dealt with the report, state that whilst they regard with favour the bacteriological process of sewage treatment, they do not feel warranted in recommending the council to adopt the system until an opportunity has been afforded of seeing it in operation on a large scale.

## Engineering Notes.

**Electric lighting on a large scale** is to be adopted by the Leeds City Council, who intend to spend £150,000 for this purpose.

The electric lighting of Calcutta will soon be an accomplished fact. A central station, with engines of 1500 horse-power and dynamos, is nearly complete.

**Electric Tramways for Huddersfield** formed the subject of a lecture recently delivered by Mr. T. H. Moore to the Liberal Club. Mr. Moore proposed their adoption in the town.

**Electricity Works for Barnsley.**—The foundation stone of the new works in Beckett Square was laid on March 10th. The electrical plant has been designed by Mr. Thomas L. Miller, of Liverpool, and the buildings were designed by Mr. J. H. Taylor, Borough Surveyor. The contracts for the erection of the buildings amount to £3080, and those for the plant total £18,931.

**Electric Lighting and a Floating Bath.**—The York City Council has decided to expend £2000 in laying a cable in Micklegate, and

the city surveyor is to be instructed to prepare and carry out the provision of a floating bath in the River Ouse, between Holgate Beck and Acomb Landing, at a cost not exceeding £350.

**Electric Light for Canterbury.**—The municipal electric installation at Canterbury was opened on March 10th by the Mayor. Just under £20,000 has been spent on the scheme, and an additional £3000 upon a refuse cremator in connection with the works. A further extension to cost £12,000 is in contemplation.

**Birmingham Tramways Company** purpose adding to their rolling-stock open cars for use on the cable route. Two cars are first to serve as an illustration of the manner of their working. The cars will be single "deckers," or, in other words, the roof seats will be abandoned. Entrance to the new cars will be obtained from a side step running the whole length of the car instead of the end door as at present. With the exception of the end windows, which have been erected to minimise draught, the whole of the seats are to be open to the road, but the sides are to be provided with collapsible guards, and the one on the inner, or right side in the direction in which the car travels, will be kept raised during the journeys. Further protection from weather will be provided by means of blinds.

**Liverpool to Manchester in Eighteen Minutes.**—The Lord Mayors of Manchester and Liverpool have consented to join a committee which is being formed among representative men of these two cities for the purpose of investigating the engineering and commercial possibilities of the Lightning Express Single-rail Railway between Liverpool and Manchester, at a speed of ninety miles per hour, which has been proposed by Mr. F. B. Behr. Both in Liverpool and in Manchester great interest is being shown in Mr. Behr's project. Twenty-five of the most influential citizens of the latter city joined in signing a petition to the Lord Mayor, in which they stated that, having examined Mr. F. B. Behr's scheme, they considered it was of sufficient importance to the commercial community of Manchester, as well as to the public in general, to deserve a careful and independent examination. Mr. F. B. Behr explained his scheme for the New Single-rail Lightning Express Railway before the Liverpool Chamber of Commerce on January 12th last. He entered fully into all the engineering and commercial details of his project, and gave an account of the single-rail railway that he had built near Brussels, on which cars were last year run at a speed of ninety miles an hour. Mr. Behr said that he would undertake that in a couple of years the means of communication between Liverpool and Manchester would beat the record of the world both for rapidity and for safety.

## COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
<b>BUILDINGS—</b>			
March 24	Bradford—Drying Works, &c., at Brewery	W. Whitaker and Co., Limited	T. C. Hope and Son, 23, Bank-street, Bradford.
" 24	Dunmow, Essex—Post Office, &c.	A. Dennis	B. J. Capell, 70, Whitechapel-road, London, E.
" 24	Glasgow—Baths	Corporation	Office of Public Works, City-chambers, 64, Cochrane-street, Glasgow.
" 24	Port Talbot, Glamorgan—Twenty-five Cottages	Miss E. C. Talbot	F. B. Smith, Architect, Port Talbot.
" 24	Rhos, Wales—Two Shops, &c.		B. Owen, 11, Penybryn, Wrexham.
" 25	Broken Cross, Macclesfield—Offices, &c.	National School Managers	Whittaker and Bradburn, 19, King Edward-st., Macclesfield.
" 25	Pontypool—Pair of Semi-detached Villas	Miss M. Wood	D. J. Boucher, Bank-chambers, Pontypool.
" 25	Stourbridge—Showyard, &c.	Hereford & Worcestershire Agricul. Soc.	A. Edwards, Secretary, Corn Exchange Offices, Leominster.
" 25	Chopwell, Durham—Thirteen Houses, &c.		D. M. Spence, Architect, Ashmount, Shotley Bridge.
" 25	Nottingham—General Hospital Wing		A. Waterhouse and Son, 20, New Cavendish-st., London, W.
" 25	Dewsbury—Extension of Electric Light Station	Corporation	H. Dearden, Borough Surveyor, Town Hall, Dewsbury.
" 25	Croom, Ireland—Sacristy		—Moriarty, Main-street, Croom.

## Property and Land Sales.

To Builders, Contractors, and others.

**MESSRS. FULLER, HORSEY, SONS, AND CASSELL** are instructed to SELL by AUCTION, in lots, at South Wharf, Lowestoft, on TUESDAY, APRIL 18th at half-past 12 precisely,

**SAW-MILL PLANT AND MACHINERY**, including vertical timber frame, two double deal frames, two circular saw benches, two moulding machines, panel planer, two general joiners, trying-up machine, two fret saw machines, tenoning machine, Richard's patent mortising and boring machine, 6 foot-power mortising machines, dovetailing, treenail, sand-papery, and painting machines, wood-turning lathe, two mitre cutters, moulding iron grinder, water of Ayr stone, eight glue-heating stoves, 118 joiners' benches, frame and circular saws, cutters, chisels, carpenters' and joiners' tools, planing machine, drilling machine, two lathes, engineers' and smiths' tools, two Cornish boilers, 30 h.p. condensing beam engine, 20 h.p. horizontal condensing engine, table engine, shafting and gearing, leather lands; also

### The BUILDING MATERIALS

of the Saw Mills and other buildings, comprising about two tons lead on roofs, 250 squares slates, 150 squares tiles, 250 squares slate boarding, 600 squares flooring, 600 squares rough and weather boarding, about 100 loads timber in roofs, girders and uprights, sashes and doors, 60 rods brickwork, quantity bricks, tiles, stone, drain pipes, old lead and iron and builders' materials, water-cart, three tumbrel and spring carts, nine trolleys and wagons, two timber whims, and other effects.

May be viewed the day preceding sale, and catalogues had on the premises; and of Messrs. FULLER, HORSEY, SONS, and CASSELL, 11, Billiter-square, London, E.C.

### Auctions for the Year 1899.

**MESSRS. TROLLOPE'S SALES OF FREEHOLD AND LEASEHOLD ESTATES, HOUSES, GROUND-RENTS, &c.**, will take place at the Mart, E.C., as follows:—

Thursday, April 20th	Thursday, August 3rd
Thursday, May 18th	Thursday, October 19th
Thursday, June 8th	Thursday, November 23rd
Thursday, July 13th	Thursday, December 14th

Sales will be held on other dates as required. In all cases Messrs. Trollope will be glad to have as long notice as possible respecting any property they may be instructed to offer by auction.

### Forthcoming Sales for the Year 1899.

**MESSRS. E. and H. LUMLEY** (Lumleys, of St. James's House, 22, St. James's-street, London, S.W.) beg to announce the following days of SALE by AUCTION, for the forthcoming year, at the Mart, Tokenhouse-yard, E.C.; but, in addition other dates can be arranged for special sales. Terms on application.

Tuesday, April 25th	Tuesday, Aug. 15th
Tuesday, May 23rd	Tuesday, Sept. 12th
Tuesday, June 6th	Tuesday, Oct. 17th
Tuesday, June 20th	Tuesday, Nov. 14th
Tuesday, July 4th	Tuesday, Nov. 25th
Tuesday, July 18th	Tuesday, Dec. 12th

Messrs. E. and H. Lumley announce in the advertisement columns of the "The Times" on Saturdays a complete list of their sales, which will include estates in England, Ireland, and Scotland, town and country properties, ground-rents, reversions, gas and water shares, stocks, &c. In cases where property is to be included ample notice should be given in order to insure due publicity.—St. James's-house, No. 22, St. James's-street, S.W.

To Syndicates, Builders, and Speculators.—Chelsea.—A magnificent Building Site of 24,000 super. feet.

**MESSRS. ROBINS, SNELL, and CO.** have received instructions from the Wilkinson Sword Co. Ltd. (in consequence of the removal of their works to more extensive premises) to LET by AUCTION, at the MART, City, on TUESDAY, MARCH 28th next, the valuable FREEHOLD SITE now occupied by the Company's works, and admirably adapted for the erection of a handsome block of flats, a theatre, or other purposes requiring a large area in a leading thoroughfare. The site has frontages of 109ft. to King's-road and 250ft. to Sydney-street, and contains an area of about 24,000 square feet.

Particulars, plans, and conditions of sale from the Solicitors, Messrs. CRUTESEMAN and ROUSE, 85, Gracechurch-street, E.C.; at the Mart; and from the Auctioneers, Messrs. ROBINS, SNELL, and Co., 22, Conduit-street, Bond-street, W.

By order of Trustees.—Preliminary Advertisement.—Freehold Building Estate, Streatham, near West Norwood Railway Station.

**MESSRS. FIELD and SONS, and Messrs. WALFORD and WILSHIN**, who are jointly concerned, will SELL by AUCTION, at the MART, at an early date, a valuable FREEHOLD BUILDING ESTATE, known as High View Park, comprising 16a. 1r. 10p., lying immediately at the rear of and with approach from Leigham Court-road; also a contiguous Freehold Building Site of 2a. and 5p. in a new road intended to connect Canterbury-grove with Thurlby-road.

Particulars and plan, in due course, of Messrs. KINGSFORD, DORMAN, and Co., Solicitors, 23, Essex-street, Strand; of Messrs. WALFORD and WILSHIN, Auctioneers, Anerley, S.E.; and of Messrs. FIELD and SONS, as above.

**REAL Cheap Lots of small weekly SHOPS or HOUSES in London WANTED to PURCHASE.** Handsome commission paid to introducers. Agents' lists of real selected and inspected cheap lots carefully examined. Send full particulars to actual buyer.—Address, "A." at Horncastle's, Cheapside, E.C.; Box 1011, BUILDERS' JOURNAL. 1

**SANITARY INSPECTORS' EXAMINATIONS.**—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E. 8

**ANSELL and MALLOWS**, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C. 1

**R. I.B.A. EXAMS. PREPARATION**, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum)

**R. I.B.A., SOCIETY of ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS.** Preparation by correspondence, in residence, or personally.—MIDDLETON and CARDEN, 19, Craven-street, Strand, W.C.

**TO ARCHITECTS, UPHOLSTERERS, and** Trade generally. DECORATIONS in any style. Reasonable terms. Town or country.—HATHERLEY, 40, Great Pulteney-street, W. 1

**FOR SALE, 64 VENETIAN BLINDS, 2ft. 8in. by 4ft. 11in.**, of best selected Pine; best drab tapes and lines; fitted with Beaumont's Patent Action. No reasonable offer refused.—Apply "Housekeeper," 23, Crutched Friars, E.C. 1

**MASONS' CHISEL STEEL, 1/2in. to 1 1/2in.** octagon, 14s. cwt. Masons' Chisels, assorted, 12s. 23lbs.—E. DEALEY, Moore-street, Sheffield. 3

## APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**BUILDER'S CLERK WANTED.** Must have knowledge of drawing.—Apply, stating age, experience, and salary expected, Box 998, BUILDERS' JOURNAL Office.

**WANTED**, energetic and experienced REPRESENTATIVE in the London and Provincial wall-paper trade. Must have good connection, and be personally well known to the principal decorators and upholsterers. Good correspondent; well educated and capable man of business; pleasing address and gentlemanly appearance. One who has represented a wholesale house or firm of manufacturers preferred. Liberal salary and commission to first-class man.—Apply, stating age, experience, full particulars, and salary expected, by letter, to "A B C," Street Brothers, 5, Serle-street, W.C.

## APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**YOUNG ARCHITECT, A.R.I.B.A.,** ASSISTS in the PREPARATION OF DRAWINGS, TRACINGS, &c., at his own Office. G. SCORER, 28, Newman-street, W.

**QUANTITIES** prepared, specifications written, works measured, and variations adjusted by reliable London Surveyor. Over twenty years' experience. Special terms by arrangement.—"Surveyor," office of the BUILDERS' JOURNAL. 41

**ESTATE MANAGER (35)** desires RE-ENGAGEMENT, town or country. First-class testimonials; good manager of men and work; experienced in building, specifications, quantities, drawings, measuring up, &c.—Box 1005, BUILDERS' JOURNAL Office. 2

**EXPERIENCED ASSISTANCE** given at own or Employer's Office; Specifications written, Designs, Plans, and Details drawn; quantities taken, Accounts adjusted; moderate terms; highest references.—Apply, "Surveyor," 11, Great James-street, Bedford-row, W.C. 2

**TO ARCHITECTS.**—ASSISTANT prepares Exhibition and Working Drawings, Tracings, &c., in spare time.—Box 977, BUILDERS' JOURNAL Office, 1

**SURVEYOR'S and Architect's Junior Assistant**, Disengaged. Levelling, surveying, colouring, inking-in, tracing, printing on plans. General office routine. Good references. Moderate salary.—"Junior," Markham's Library, Oundle. 1

**ADVERTISER** prepares Plans, Designs, Details, Tracings, Specifications, &c., for all building purposes, in spare time.—Apply, Box 991, BUILDERS' JOURNAL Office. 1

**ADVERTISER, Exceptional Architectural** Draughtsman, executes Competition and Exhibition Drawings, Designs, and Perspectives in Ink, Wash, or Colour, and Architectural Sketches of every description.—Box 1002, BUILDERS' JOURNAL. 2

## An Architectural Causerie.

### Causes of the Prevailing Depression in the Art Market.

It is undeniable that a serious depression affects the artistic industry of the country at the present time, which is especially felt by the painters of easel pictures, and that many practitioners of the arts called "Fine" who entered upon their studentship years ago with buoyant hopes and the determination to perform great things, or, at least, to do the best which their unproved talents would allow, have so far fallen short of realising their ideal in that or any other way, that the sordid cares and anxieties of providing for daily needs have perforce taken up the whole of their daily attention, leaving little power to perform great things even if the opportunity should ever arrive. And although this may prove in the end good for art, by weeding out those whose bent is not strong enough to stand starvation, and discouraging others of the same kidney from attempting the difficult path, just at present it appears to make it hopeless for those who have not money at their back to enter the profession, which is surely a loss to the art of the country, since talent is not the sole heritage of the well-to-do. It may be worth while to inquire into the causes of this depression, for if some or all of them could be removed it would at the same time benefit the nation and be of assistance to a class which as a whole is generally underpaid, though the success of the few is so great as to give a false impression of the ease and luxury in which its practitioners are supposed to live. The first cause was no doubt the general depression from which the trade of the country suffered some years ago, during which men of means found that they could do without fresh pictures without suffering very much, the passion for art being rare among Englishmen. Then the artists themselves showed their patrons how a pleasant decorative effect could be given to their rooms at small cost, things which were pleasant in colour and fine in form assisting the effect greatly, though they might be inexpensive, and patrons were not slow to learn the lesson. Then painters and the critics who haunted the studios were again to blame, in that they could not resist the temptation of pointing out the faults which they thought they saw in pictures shown to them, for one must, of course, be superior to the things in which one can see faults! And as opinions in art matters are almost as various and numerous as the practitioners, it was soon found that no picture escaped condemnation

by some one who claimed, at all events, to know what he was talking about. The natural consequence was that patrons determined to delay their purchases until there was some consensus of opinion as to what was worth buying. Another contributory cause was the favour with which large sketchy landscapes were received. Such works took but a short time to paint, and could be sold for low prices, whereas a figure picture of the same size, painted with any approach to completeness, cost almost as much to produce in absolute out of pocket expenses, and was therefore necessarily much dearer. But the estimation of Art by the ordinary purchaser being largely commercial, the highly wrought figure picture stood a poor chance of sale by the side of the equally large landscape at a much lower price, the patron's mind being confused as to actual values, added to which the delight taken in natural beauty by the ordinary town dweller disposes him to admire and desire to possess pictures representing landscape rather than figure work. All these causes have contributed to the present

### The Suburban Thames.

THE Thames above London for that ten miles or so which is bordered by suburban villas and great waterworks has not for many years past been threatened with so many changes as now. London only "discovered" its river as a pleasure resort, and the riparian districts as residential neighbourhoods, well within the memory of the middle-aged; and with this discovery has come the occupation, not only of the pleasant meads along the banks for building purposes, but also of the land stretching away from the valley back to the low hills that confine the basin of the Thames—a tract of country which, following the terminology of Anglo-German political agreements in Africa, may well be called the "hinterland." "Hinterland" is a blessed word, and expresses much in small compass; but the pleasing leas and foothills which form the hinterland of the suburban Thames are fast becoming unblest with a wilderness of small houses, which are not only no better than they ought to be, but are not, by a long way, so good as they well might be. We may,

THE ISLAND HOTEL, EEL PIE ISLAND. DRAWN BY C. G. HARPER.

depression, and there is yet another. The immense production of the last thirty years has so congested the houses of patrons, many of whom have inherited collections, as to make them very fastidious as to what they select to add to their already large stores, while those who have tried to realise the money laid out upon them have often found that from various causes the investment has not turned out well. This tends to make patrons shy of buying now, fearing a like result in the future. It is to be feared that the depression will last for some time yet, for painters are still being manufactured by the hundred by schools of Art all over the country, and the students of the present day certainly have not less confidence in their own judgement than those of twenty years ago, nor are they more chary of expressing their opinions, while moneyed men, if they have a taste for Art, appear now to prefer to contend with each other in the sale rooms for acknowledged masterpieces, in place of educating their perception and insight by seeking out the works of comparatively unknown men who show promise. A. W.

however, congratulate ourselves that the smug enormities of Surbiton, built from thirty to forty years ago, are no longer possible. We may see innumerable suburban roads rising in the Thames Valley, but at least they are of cheerful red-brick and of an inoffensive design for the most part; while Surbiton remains a monument of yellow stocks, stucco, and bad taste. But it is not wholly of these things that we would speak, but rather of the changes which this vastly increased population along its banks has wrought, and is about to work, on the river itself. Let us take, for example, Richmond and Twickenham. Richmond Bridge, built a hundred and thirty years ago, belongs to the Augustan age of bridge-building in England, and is correspondingly dignified and stately. The growth of traffic in Richmond town and surrounding districts has rendered this structure too narrow for present needs, and the heavy gradient of its roadway is now found to be more trying than in the days of old, while omnibuses were as yet undreamt of. So proposals are now in the making for its demolition and replacement by another and

more commodious structure. At the same time news comes that Twickenham, on the other side of the river, demands direct communication with the Surrey shore, and at no less famous a spot than Twickenham Ferry, as picturesque a place as you shall find within twenty miles of town, and one sung and painted by many sweet singers and famous artists. The drawing-room ballad of "Twickenham Ferry," popular some fifteen years ago, reflects the sentimental associations of the place, and if the actual ferryman is neither young nor romantic, the spot has a charm which must inevitably vanish when a bridge spans the stream. It is good hearing that the Twickenham District Council is considering the advisability of purchasing the Marble Hill estate near here, and preserving its riverside lawns and well-wooded grounds as a public park, thus saving this reach of the river from being built on; but, against this item, is the fact that Eel Pie Island will shortly undergo a change, in the demolition of its old fashioned "Island Hotel," which is to give place to a modern hostelry of a soaring character—"palatial" as the phrase goes; but ill-assorted with the picturesque waterside character of the place, whose mossy piles, tangled underwoods, and tall elms render this a veritable isle of romance. That the Duke of Orleans has erected a boat-house and a hideous river wall at York House, just here, is to be deplored, as taking from the rustic character of the spot, and that in the recent proceedings anent Glover's Island, at Richmond, the advertiser with his hoardings is bent on invading the district is another sorry sign of the times.

C. G. H.

## ARCHITECTS AND TRADE COMMISSIONS.

IN reference to the recently published report of the London Chamber of Commerce on "Secret Commissions"—upon which we commented last week—and to the very general discussion which has arisen upon that report, we have received the following letter from a well-known firm of manufacturers of builders' materials and sanitary appliances:—

To the Editors of THE BUILDERS' JOURNAL and THE ARCHITECTURAL REVIEW.

"DEAR SIRS,—Your journals have made their position, because they are beyond competition, and your place is strong enough to take a definite stand on the subject of trade bribery and architects' commissions. I wish you would insert the inclosed letter, omitting all names, and ask the Institute of Architects and Surveyors whether it permits its members to take commissions. Manufacturers would be infinitely indebted to you for taking this thing up, and would support you very thoroughly against a squeezing, many are too weak-kneed to resist."

The inclosure referred to is the following letter addressed to our correspondents by an architect, described as "C. E., Fellow Institute of Architects and Surveyors":—

"DEAR SIRS,—I have specified ten of your salt-glazed mangers with water division, bran plug, and washer. These are to be used at some stabling I mentioned to your traveller some time ago. If the contractor has not arranged a price with you I shall be glad for you to include for me a 10 per cent. discount. I think he will be ready for them in about three weeks."

To this letter our correspondents replied as follows:—

"DEAR SIR,—We are glad enough to have your work, but we do not like commissions and never pay them. We think the system derogatory to both architect and manufacturer, and one which cannot be too strongly deprecated."

## On Reflection.

### "An Architect Wanted."

UNDER this heading we published last week a letter from a correspondent who required an architect to design for him a country house, and we added an invitation to any who might be disposed to undertake the work to put themselves in communication with us. The response has been extraordinary. Our original intention was to forward to our correspondent such letters as we received, leaving him to make his own selection. But the number of applicants—already more than forty—makes it necessary, if our correspondent's purpose is to be served, that some sort of selection should be made for him. We have accordingly decided to initiate a competition in which we shall ourselves pay the premiums. By this means we shall, while acting with perfect impartiality, best serve the interests, we think, both of our correspondent and the architects who offer him their services. We defer until next week a detailed statement of the Conditions of Competition, but meanwhile we may state that our offer applies equally to all architects, not only to those who have already made application.

### The New A.R.A.

By the election of Mr. Aston Webb to the Associateship of the Royal Academy, a well-deserved honour has been paid to one of our most eminent and conscientious architects. Mr. Webb has been a hard worker, and he has rendered yeoman's service to the profession he adorns, having served the two great architectural bodies, first as President of the Architectural Association, then as Hon. Secretary, and afterwards Vice-President of the R.I.B.A. But his services to Architecture in the larger sense consist in the works he has carried out, which, taken as a whole, may be fairly regarded as representative of the highest accomplishments of present day architects. Mr. Webb's most ambitious work has not yet been given to the world. Two or three years ago he was invited by the Government with two other architects to prepare designs for the completion of the South Kensington Museum. Mr. Webb's designs were regarded by the assessor, Mr. Waterhouse, as the most satisfactory of the three; but up to the present nothing has been done towards carrying them out. The work cannot, however, be much longer delayed, and when the much needed building is erected, we shall have not only a worthy home for a great Government department but a noble and enduring monument to an artistic genius of the first rank.

### Employers in Parliament.

TOWARDS the end of last session there was established a Parliamentary Council, consisting of duly appointed representatives of the various trades, the objects of which were stated to be: "To take action with respect to any Bills introduced into either House of Parliament affecting the interests of trade, of free contract, and of labour, or with respect to the action of Imperial or local authorities affecting in any way the said interests." The new Council was an offshoot of the "Labour

Protection Association," of which the Earl of Wemyss is the presiding genius. To the principle of a committee representing in Parliament the special interests of employers no reasonable person could object. Indeed, it seemed an altogether desirable thing that, side by side with the body which authoritatively represents the interests of the workmen in Parliament—the Parliamentary Committee of the Trades Union Congress—there should be another, equally authoritative and equally representative, which might speak for the employers of labour. Given two committees, composed of businesslike and reasonable men, one might suppose that much friction might be avoided, and many questions affecting employers and employed adjusted with mutual satisfaction as the result of friendly pourparlers between the two bodies. But "businesslike" and "reasonable" are the last epithets to apply to the Employers' Parliamentary Council, which is evidently dominated by the antiquated individualism of the Earl of Wemyss, and looks at every question from the standpoint of days prior to the passing of the factory acts. We have just received a paper published by the Council, setting forth the title and purpose of a number of public and private bills now before Parliament to which the Council proposes to offer opposition, together with a short statement of its grounds of objection. Some of these bills are introduced by Liberal and some by Conservative members. The Council is impartial in its opposition. Proposals to limit hours of labour in mines, bakehouses, and shops, to secure qualified attendants for steam engines and boilers, to provide automatic couplings on railways, to extend the principles of the Workmen's Compensation and the Truck Acts, are all objected to; but to our mind the most objectionable feature of the Council's attitude is its affectation of solicitude for the good of the working man. The Council's object, as revealed by its actions, is clearly to prevent any legislation which makes for the safety, the health, and the happiness of the working classes, if there is the slightest danger of such legislation affecting the pockets of the employers.

### The Foes of Peace.

THE latest accomplishment of this precious council is to veto one of the most hopeful schemes that have recently been brought forward for the promotion of industrial peace. Mr. Ritchie in pursuance of what happily seems to have become the fixed policy of the Board of Trade, whether a Liberal or a Conservative Government happens to be in power, has been making efforts to bring about some workable arrangement by which strikes and lock-outs, with their attendant evils, may be rendered less frequent, if not altogether prevented. Among other steps Mr. Ritchie communicated to the Employers' Parliamentary Council a suggestion, which emanated from the Parliamentary Committee of the Trades Union Congress, that a Board of Conciliation consisting of employers and employed should be established, to whom all disputes should be submitted. There was to be no compulsion to accept the suggestions of the proposed Board, but no strike or lock-out was to be begun until the Board had considered the issues and pronounced upon them. The Employers' Council has rejected the proposal, with expressions of sympathy for its objects, which Mr. Ritchie and the public will no doubt appreciate at their right value. We do not for a moment suppose that this Parliamentary Committee is in any real sense representative of the employers of the United Kingdom; if it were, the hope of a happier relationship between employers and employed, based upon a juster and more reasonable estimate of mutual duties and responsibilities, would be small indeed.

— PORTRAIT OF INIGO JONES, FROM AN OLD ENGRAVING.

## SOME NOTES ON THE WORKS OF INIGO JONES.

By H. INIGO TRIGGS, A.R.I.B.A.

THE history of the English Renaissance falls naturally into three well marked divisions; (1) the experiments of those who accepted any form of Art, so long as it emanated from abroad; (2) the success of Inigo Jones and Sir Christopher Wren; and (3) the long decadence.

It is with the second of these three divisions this essay proposes more especially to deal, but in considering the life of Inigo Jones and his influence on the Architecture of this country it is essential that something be said about the first of these three periods.

At the decline of Gothic Architecture the Italians were foremost of the foreign artisans, who, under the patronage of Henry VIII. and the nobility of his day, were employed in considerable numbers, more especially in the southern counties; doubtless owing to the Court influence and the proximity to the Continent. It is particularly noticeable that they do not appear to have designed and carried out any single building, and we must therefore suppose, that their art was confined solely to designing small things, and was an affair of detail, of delicate arabesque in plaster and terra-cotta, and of carving, for which they had always been so justly famous.

From the influence of these Italians the art of this country was destined to undergo an important change, being as much affected by them as the literature was. The passion for everything Italian amounted to such a craze that no man of any standing could be said to have completed his education without a visit to Italy; and it became the fashion to import Italian objets-d'art. The collection of which, together with pictures of the Italian masters, soon assumed such proportions that it was not long before it spread to Architecture. Many students visited Italy partly as the agents of noble patrons, and partly for the purpose of educating themselves in the new style. These students on their return home would take a position as foremen among their fellow workmen (the profession of an architect being at this time unrecognised), and they undoubtedly are responsible for much of the design we find at this period.

On the death of their great patron Henry VIII. the Italians appear to have departed from England. Edward VI. during his short reign preferred rather to spend money on education than on art, and after the extravagant excesses of Henry's court, the nobility could hardly have been in a very rich condi-

tion. Little building appears to have been done during the reigns of Edward VI. and Mary, though under the rule of the latter the decay of Gothic Architecture received a slight check. These were, however, troublous times, and one would hardly expect to find much advance in the art of Architecture.

The conclusion we may therefore arrive at is that the direct influence of this first attempt to introduce Italian art was not of sufficiently long duration to have very considerable results, more especially as the area affected was so small; but it enlarged men's ideas, and created a desire for greater knowledge of the ancients, a desire largely fostered by the amount of classical literature published at this time.

When Queen Elizabeth commenced her reign the separate existence of the architect from the general body of workmen was still not recognised, buildings were erected principally from specifications, many examples of which still exist, drawings were very seldom used. This want of architects was largely atoned for by the amount of taste for Architecture displayed by the nobility.

Affairs with Venice now became strained, Pope Pius V. endeavoured to induce all Roman Catholic powers to break off relations with England. Queen Elizabeth, from political and private considerations sympathised with the Protestants on the Continent, and nearly all the foreigners who came to England during her reign, were natives of Germany and the Low Countries. It thus happens that the influence of the Germans on design now began to predominate over that of the Italians, and eventually ousted them out of favour. There were also about this time many pattern books of design published in Antwerp, and exported to this country, and the lavish use made of these books by the workmen of the age becomes very noticeable when we examine the arabesques, strap work, and jewel work (patterns evidently emanating from Continental sources), which adorn the buildings of the Elizabethan age.

Speaking of this important period which directly preceded the Renaissance proper, Mr. Reginald Blomfield says:—"The effect of German art on English was greater for the time than the Italian, but not so lasting in its results; that this influence had not sunk deeply is evident from the ease with which Jones overthrew it, and it did not appear in

England as long as the development of Architecture was spontaneous and traditional, and though not unconscious was not the result of deliberate eclecticism.

"The real and essential change in English Architecture, the change which altered not merely its detail but its whole intention in building, is not to be found in these experiments of the sixteenth century, but in the far-reaching revolution introduced by Inigo Jones, the first Englishman to grasp in its full significance the art of the Italian Renaissance."

With Inigo Jones an entirely fresh start was made. More than a century after the Italian Renaissance had been in full swing he was the first Englishman to make of it a serious study, and being also possessed of an exquisite sense of proportion, as well as an amount of learning in advance of the age, there is little wonder that, when almost fresh from Italy, having made the acquaintance of King Christianus IV. of Denmark, he was introduced by that monarch to the English Court, where, once established, he quickly arrested the German element, which then held sway over English Architecture.

When Jones first set foot in Italy Michael Angelo and the best Italian architects had passed away, and the decadence had set in, he had therefore the very best work to study from, and moreover being able to detect the decay, was able in his own practice to steer clear of its causes.

It has been said of Inigo Jones that he destroyed the English tradition, which up to his time was a living factor in English buildings in spite of ornament borrowed from Italy and Germany. But when we consider how this tradition had remained uncared for, how the art of Architecture was being swayed by fashion, how fast the eclectic tendency was growing in the English people, refusing to be repressed, we cannot but acknowledge that if Art was to be directed by varying fashion, instead of by gradual growth, the channel through which Inigo Jones has the responsibility of having directed it, was undoubtedly the best. Had Jones lived a century earlier his influence would probably have had an entirely different result, and his genius might have promoted the growth of Gothic Architecture, although, judging from the way the Italian Renaissance affected all the cultivated nations of Europe, it seems hardly probable

COLESHILL HOUSE, BERKSHIRE.

that England could long have withstood the growing tide.

Inigo Jones was born in Smithfield, London, on July 15th, 1573, and was christened four days later in the Church of Saint Bartholomew of that parish. His father was a cloth-worker, who seems not to have been particularly prosperous, at any rate in his later years, for we find that on his death, Inigo was left an unpleasant legacy; in the father's will, dated 1596, which was executed just before his death, he bequeaths to his son "All the debtes, billes, bondes, and bookes that I leave in writinge, to receave and to paye my debtes, so farre forth as they maie be received." It has been said that Inigo the elder was a tailor near St. Paul's, and was connected with Spanish merchants, one of whom gave his Christain name to the child, but this is scarcely probable; the name was not an uncommon one, it being the English form of Ignatius, and as the father as well as his illustrious son were devout Roman Catholics, it is little to be wondered at that they bore the name of the saint.

Very little is known of Jones' earlier life; the probability seems to be that he was apprenticed to a joiner. He seems, however, not to have remained long in this occupation, for we find that he was distinguished in early life for painting, and took up this profession. His first biographer states that "He was particularly taken notice of for his skill in the practice of landscape painting," which probably was the reason that one of the lords of the Court sent him to Italy to study landscape painting. Arrived there, the claims of Architecture appealed to him more strongly than those of painting. Of this period in his career. He himself writes: "Being inclined to study the arts of design, I passed into foreign parts to converse with the great masters thereof, in Italy, where I applied myself to search out the ruins of those ancient buildings, which in spite of time itself, and violence of barbarians, are yet remaining; having satisfied myself in these, and returning to my native country I applied my mind more particularly to Architecture." But he evidently did some painting, for there were, until quite recently, two landscapes, in the collection at Chiswick House, where also a large collection of his drawings was stored. These, or rather most of them, were, in 1892, given by the present Duke of Devonshire into the custody of the Royal Institute of British Architects.

Webb, who was his pupil and executor, says, "He was architect-general unto four mighty kings, two heroick queenes, and that illustrious and never to be forgotten Prince Henry." He goes on to say that he was first employed by Christian of Denmark, who sent for him from Italy, and then he was employed by Queen Anne, the Danish princess, who married the then King James VI. of Scotland, but who had now become King of England. Their eldest son Henry, Prince of Wales, an exceedingly cultivated prince, recognised also the genius of Inigo, and took him under his especial patronage.

How long he spent in Denmark is uncertain; several buildings are attributed to him, but it must be admitted on very slender grounds. He is said to have assisted in building part of the Palace of Fredericksborg, because it bears such a resemblance to Heriot's Hospital, Edinburgh, but it is exceedingly doubtful if he had anything to do with the latter building, and even more open to question if he was employed at Fredericksborg.

Queen Anne may be said to have been the means of introducing him to the Court of James, and he soon became actively engaged in arranging the Masques which formed such a feature in Court revels of this period, and on which it seems too much time and money could not be expended. These Court Masques formed a great contrast to the plays of Queen Elizabeth's reign, when people had been content with the wonderful genius of Shakespeare and his contemporaries without any setting of scenery or stage effect. The Masque was a brilliant pageant, the words often, to the disgust of Ben Jonson, being only used as a necessity to describe the

scenery, and it was in these plays that Inigo's genius was employed to produce elaborate stage effects. He was the first to employ scenery on a large scale in England; having no doubt learnt many things on this subject from the Italians. With this great talent, we can understand his becoming a favourite in the Court, which is known to have been one of the gayest and most frivolous of its time. His first important Masque was given at the instigation of the Queen of James I., at Whitehall, on Twelfth Night, 1604. The words were by Ben Jonson, who says himself that the bodily part was "of Master Inigo Jones's design and act." The whole description of the scenery is given in Ben Jonson's works; the cost of the Masque was about £10,000 of our present money, and, when one considers the extraordinary amount of preparation involved in its production, one is not surprised at the sum. In the same year he was busy preparing the scenery and devices for three plays, presented before the King in the hall of Christ Church, Oxford, which, perhaps, hardly came up to the expectations aroused by his earlier success, for a contemporary thus alludes to the performance in a news-letter: "They hired one Mr. Jones, a great traveller, who undertook to further them much, and furnish them with rare devices, but performed little of what was expected. He had for his pains, as I have constantly heard, £50."

The Masque of Hymen on the following Twelfth Night was the joint production of Jones and Jonson. The latter here praises Jones when he says: "The design and art, together with the devices and their habits, belong properly to the merit and reputation of Master Inigo Jones, whom I take the modest occasion in this fit place to remember, lest his own worth might accuse me of an ignorant neglect from my silence." We shall notice that those cordial feelings gave place later to great jealousy on the part of Ben Johnson. It was in this Masque that Jones made an even further departure, and gave what was, perhaps, the first transformation scene in England. The upper part of the scene was composed of clouds, which were made to swell and at last opened, discovering Juno seated on a throne, supported by peacocks; whilst above her, surrounded by fire, stood Jupiter.

He was employed on many other Masques at this period of his life, and, probably owing to his reputation and versatility, he was employed by the Crown on a mission to France in 1609, as appears from an entry in the treasurer's book—"To Inico Jones, upon therle of Salisburies warrante, dated 16 June, 1609, for carreinge lres (letters) for his Ma<sup>ty</sup> servyce into Fraunce, xiiij' vj' viij'."

On his return he prepared another Masque, working with Jonson, and receiving an equal reward with him for his share of the "invention."

But from this time the relationship with Jonson does not seem to have been of the most amicable nature, and in 1619 Jonson made the anything but complimentary remark to Prince Charles, "that, when he wanted to express the greatest villaine in the world, he would call him ane Inigo," and, continuing, he says: "Jones having accused him for naming him a fool behind his back, he denied it, but I said he was an arrant knave, and I avouch it." This, the first quarrel, was patched up, and they joined together for the last three Masques which took place in the reign of James I. The last in which they worked together was performed before King Charles and his Queen. It was entitled "Chloridia," and was the cause of the great quarrel between the collaborators, which arose from the circumstances that Jonson put his name on the title-page before Jones. This was the last of Jonson's Court entertainments, his place being taken by others, who were more subservient to Jones, and flattered him considerably. Heywood among them, who says: "I cannot pretermit to give a due character to that admirable artist, Mr. Inigo Jones, Master Surveyor of the King's Works, who, to every acte, nay, almost to every sceane, by his excellent inventions gave such an extraordinary lustre upon every occasion changing the stage, to the

admiration of all the spectators, that, as I must ingeniously confesse, it was above my apprehension to conceive, so to their Sacred Majesties and the rest of the auditory it gave so general a content that I presume they never parted from any object presented in that kind better pleased or more plenally satisfied."

But Ben Jonson, although supplanted at Court by the influence of Inigo, had not done with him. He wrote "An Expostulation with Inigo Jones," in which he says: "Painting and carpentry are the soul of masque," and again, "Thy twice conceived, thrice paid for imagery." Jonson points out, what is most probably the truth, that Jones wanted to be master of all, and get all the praise, an attitude which was naturally most galling to the playwright. In Jonson's later play of "The Tale of the Tubb," Inigo is represented in the character of Vitruvius Hoop, but Jones had so much power that by order of the Lord Chamberlain the part was cut out, as it says in the old entry "exceptions being taken against it by Inigo Jones, Surveyor of the King's Works, as a personal injury unto him." Even as the play is handed down to us, much shorn of its original character, one can easily trace Jonson's bitter enmity towards Jones.

SQUIRE TUB: Can any man make a masque here in this company?

TO-PAN (a tinker): A masque? What's that?

SCRIBEN (the great writer):

"A mumming or a Shew

With vizards and fine clothes."

CLENCH (the farrier):

"A disguise, neighbour,

To the true word. There stands the man can do't, sir,

Medlay, the joiner, In-and-In, of Islington, The only man at a disguise in Middlesex."

SQUIRE T.: But who shall write it?

HILLS: Scriben, the great writer.

SCRIBEN:

"He'll do't alone, sir, he will join with no man,

Though he be a joiner, in design he calls it, He must be sole inventor, In-and-In Draws with no others, In's projects, he will tell you,

It cannot else be feasible, or conduce Those are his ruling words."

It is interesting to note that Jonson calls Jones a joiner, which makes it even more probable that he had been apprenticed to one in his youth, as has been already stated.

It was at the time of this quarrel that Jones lost his friend and admirer Chapman, the poet, with whom he had been associated in arranging masques. He erected a monument to his memory in the churchyard of St. Giles'-in-the-Fields, where it is still to be seen.

(To be continued.)

The Venice Art Exhibition will be opened on April 22nd and closed on October 31st. Special rooms will be dedicated to some of the chief artists.

A large block of warehouses in Fountain Court, Aldermanbury, London, is to be rebuilt from the plans of Mr. H. E. Chatfield Clarke, architect, of 63, Bishopsgate Street Within, London, and the cost of the work is estimated at £12,000.

The Birmingham Royal Society of Artists' 34th spring exhibition is in course of preparation, and a private view for subscribers will be held to-morrow. The society has secured for the present season a selection of the works of Mr. Walter Langley, R.I.

Portobello Improvements.—The sub-committee of the Corporation which has charge of the improvements at Portobello, provided for under the Amalgamation Act, have resolved to recommend the extension of the promenade on the beach from the present termination at Pipe Street westwards to King's Road, at a probable cost of £7500. It was also resolved to recommend the formation of a drainage system, at a probable cost of over £12,000.

## FURNISHING TRADES EXHIBITION.

THE third annual Furnishing Trade's Exhibition and Market, which was opened at the Agricultural Hall, Islington, on the 17th inst., is primarily intended to afford a meeting place for business purposes for the wholesale and retail trader. This purpose is admirably served, inasmuch as the exhibition is larger and more representative than those of previous years, and it affords the retailer an opportunity of seeing the best that is being done in every branch of the furnishing trade. The general public is excluded from the exhibition, admission being by invitation ticket and trade card, and, from the business point of view, this exclusion is no doubt wise. But from another point of view, it is perhaps a little to be regretted. There are many, probably, who, being neither buyers nor sellers of furniture, would yet find a certain interest in such an exhibition from the evidence it would afford of the progress or retrogression of artistic taste in this country. The art critic would doubtless find many things at the Agricultural Hall that would shock his artistic sensibilities, but he would find there a surer index than could be found in any art gallery of the average level of artistic culture attained by the masses of the people. Among a truly artistic people, such as the ancient Greeks, not pictures only, but the common articles of everyday use are objects of beauty; an inartistic people will be perfectly content if these articles merely fulfil their utilitarian objects.

The visitor to the Furniture Exhibition who should examine the exhibits in this philosophical spirit would find, we think, not a little that he would regard as distinctly encouraging. Of the aggressively ugly there is, perhaps, less than might be expected, while not a few of the designs for sideboards, overmantels, and bedroom suites, reach a high level of artistic excellence. One of the most artistic stands in the exhibition is that of Messrs. Charles Marco, and Co., pedestal manufacturers, of 4, New Zealand Avenue, Barbican, E.C., who, in addition to a great variety of pedestals of attractive design, are showing some beautiful examples of artistic work in bronze and terra-cotta. Immediately adjoining this stand is that of Mr. W. W. Ratcliffe, of 219, Old Street, E.C.; here also are to be seen a number of artistic exhibits, chiefly of Louis XV. and Sheraton drawing-room goods. There seems to be a revival just now of the taste for Sheraton furniture. Several firms make a speciality of this class of goods, in particular Messrs. E. Kahn and Co., Limited, of St. Andrews' Street, E.C., have a capital display, which includes some exact reproductions from original old cabinets, bureaux, and occasional tables. The same firm also exhibit a good selection of carved oak furniture and of bronze fittings for electric lighting.

Messrs. John Hough and Son, of Birmingham, are showing a bedroom suite of specially attractive design in satin walnut, polished Chipendale, with pollard oak panels; also another of the same design in ash, polished golden. Messrs. Alfred Goslett and Co., of Tabernacle Street, E.C., are showing a large selection of overmantels of all kinds; some of their "Louis" glasses are specially attractive. This firm also does a large business in building materials, including wall papers, leaded lights, colours, varnishes, polishes, &c. Some novelties in ebonised and green maple furniture are being shown by Messrs. D. Jacobs and Sons, of Hackney Road, London, E., and a great variety of folding furniture is to be seen at the stand of Mr. E. Atkins, of Church Row, Bethnal Green Road, E.

The Jarrahdale Jarrah Company have an exhibit of special interest to builders; their famous West Australian hardwood is best known as a material for street paving, but it is now also being largely used for shop fronts, window sills, stair treads, counter tops, &c. For these purposes it would seem to be

admirably adapted, as it takes a beautiful polish and presents a very handsome appearance. Messrs. Cobbett and Co., the well known timber merchants, of Virginia Road, Bethnal Green, E., are showing samples of various woods for turning, picture-frame mouldings, planed fret-woods and prepared panels, and also specialities in turning. Mr. C. Alstrom, of 76, Great Eastern Street, E.C., who manufactures all kinds of office and library furniture, show-cases, and shop fittings, exhibits a few samples only of his wares. Mr. Alstrom employs 500 men in a steam factory, and makes a speciality of supplying an estimate and drawing on the spot for any work required. An exhibit which should interest large employers of labour is the "Dey" time-register, an ingenious arrangement for registering the time of arrival and departure of employees. The workman presses a button every time he enters or leaves the works, and the time is automatically printed on a roll of paper running over a

## GOTHIC ARCHITECTURE\*

By JOHN BILSON, F.S.A., F.R.I.B.A.

(Concluded from page 105.)

IN treating of the vaults over the principal spans of churches, the author said that the Normans aimed at covering all parts with stone vaults. The plans of piers sufficiently indicate that the vaulting of the principal spans was intended to follow the vaulting of the aisles. The choir piers of Saint Nicolas, Caen, and Saint Georges-de-Bosherville were cited as typical examples. Each shows a group of three shafts on each side of the pier to carry the arch-orders of the main arcades, a single shaft which receives the transverse arch of the unribbed aisle vault, and a corresponding shaft towards the main span. It is not improbable that the failure, which naturally attended the construction of the earliest

LE VIEUX, ST. ETIENNE, CAEN. DRAWN BY F. CHATTERTON.

drum inside the machine. Another mechanical contrivance that is worth noticing is Phipp's Patent Automatic Gas and Electric Light Extinguisher, which works by clockwork, and will turn off gas taps or electric light switches at any set time.

**The Church of Le Vieux St. Etienne, Caen**, of which an illustration is given on this page, is a fine example of the latest phase of French Gothic. It dates from the days of William the Conqueror, but has been restored, —not very happily—in recent times. The interior contains some very beautiful work, notably the cupola. It seems incredible that the people of Caen should have allowed their beautiful church to fall into its present state of neglect and ruin; portions of the building are used for the storage of forage, others for the safe custody of street cleaning implements, brooms, rakes and the like. Such at any rate was the state of affairs at the time when the above sketch was made. The sketch shows the tower viewed from a narrow street close by.

vaults over wide spans, may in some cases have rendered subsequent reconstruction a necessity. Very few early examples of vaults over wide spans have survived. The earliest instance in England of a ribbed vault over the principal span of a great church is the choir vault of Durham Cathedral, though here the original vault was replaced by the existing vault in the thirteenth century. The vault over the north transept of Durham is probably the earliest of such vaults still existing. The evidence of the structure itself, the analogy of the other vaults of the church, and the documentary evidence, taken together, enable one to speak with some approach to certainty of the character and date of the original choir vault of Durham. The plan of the choir, consisting of two double bays, is a type usually associated with a sexpartite vault. But the date is much too early for this kind of vaulting. There can be no doubt

\* *Resumé* of a paper read before the Royal Institut of British Architects on March 20th.

that the original choir vault was a ribbed vault, and it may safely be concluded that the choir was originally covered with a double quadripartite vault over each double bay, closely resembling the vault of the north transept, erected almost immediately afterwards.

The vaults of transepts and nave at Durham next came under examination, and were discussed at length, the author showing that the character of the work indicated that the vaulting idea was present in the earlier parts of the structure, and that it was abandoned and again taken up while the work was still in progress. Touching the date of the nave vault of Durham, there is absolutely no authority for Billing's statement, repeated by later writers, that it was constructed between 1233 and 1244 in the Norman style. Symeon's continuator proves that the nave was vaulted between 1128 and 1133, and this is borne out by the character of the masonry of the vault itself. Durham affords complete proof of the ability of Norman builders to construct ribbed vaults over the principal spans of a great church, and to abut the thrust of these vaults by arches across the triforium of which the flying buttress is merely a development. Evidences quoted by the author indicate that the choir vault was constructed by 1104, the vault of the north transept may be assigned to a date within the first decade of the twelfth century, and that of the south transept within the first quarter of the century; while the nave vault, with its pointed transverse arches, was constructed between 1128 and 1133.

Examples of vaults showing the influence of Durham were cited in the priory church of Lindisfarne, no part of which appears to be later than the middle of the twelfth century, and, on a small scale, Warkworth Church, (Northumberland). The nave of Lincoln was vaulted before the middle of the twelfth century. It was built by Remigius, and, dedicated in 1092, was injured by fire in 1141, and Giraldus Cambrensis states that it was vaulted by Bishop Alexander. Henry of Huntingdon places the date of this work at 1146. What this vault was like may be gathered from the chancel of Stow Church, Lincolnshire, the detail of which so closely resembles Alexander's work at Lincoln as to prove that it was executed by the same school of masons. The evidence here indicates that Alexander's nave vault at Lincoln must have been ribbed.

The following early examples of ribbed vaults to apses were referred to, and their characteristics described: The small apsidal chapel on the east side of the south transept of Christchurch, Hants, appearing to date from early in the twelfth century; the apsidal chapel on the east side of the south transept of Tewkesbury Abbey church, which may be assigned to the first twenty years of the twelfth century; Birkin Church, Yorkshire, middle of twelfth century; the octopartite vault of the Treasury of Canterbury Cathedral; the apse vault of the Chapter-house of Durham Cathedral, a larger and more advanced example, finished by Bishop Geoffrey Rufus, 1113-1140. The last-named was partly destroyed by fire in 1796, but Carter's drawings have preserved an accurate record of it.

The author concluded his paper with some observations on the bearing of the English evidence on the general question discussed in the prefatory paper previously referred to. Before the introduction of the rib, the Normans were already developing the articulation of their construction to an extent quite unknown in the Ile de France. The earliest ribbed vaults exhibit a system which is slightly less advanced than even the primitive vaults over the aisles of Saint Etienne, Beauvais. The large number of ribbed vaults still remaining proves the existence of an active school, which had already accomplished much before the introduction of the pointed arch. It is remarkable that all these English vaults are quadripartite. No example is met with either of the sexpartite vault or of the intermediate form—quadripartite cut by a secondary transverse rib—both of which occur in the group of churches in and around Caen. Obviously the quadripartite vault was the earliest form,

and varieties could not have been developed if the quadripartite vault had not previously been known. The evidence of the rib sections points in the same direction. As in their system, so also in the profiles of the rib mouldings, the earlier ribbed vaults in England come into line with the quadripartite vaults at Lissay, and represent an earlier stage than the vaults of the Caen group. These latter, whether sexpartite or of the intermediate form, show one easily recognised type of the rib section, a more refined and clearly later type not found in England until the octopartite vault over the Treasury at Canterbury Cathedral, probably erected soon after 1130. The approximate date of 1130 suggested for the earliest vaults of the Caen group, seems probable enough, and the experiments which the builders of these vaults tried in setting out the curves of the ribs, indicate that they were not adopting ready-made a system already worked out elsewhere. Apart from the English evidence, the authenticated dates of the earliest ribbed vaults prove that influence from the Ile de France is quite impossible, and show the complete independence of the Norman school up to, at any rate, the end of the first third of the twelfth century.

Mr. Phené Spiers proposed a vote of thanks to Mr. Bilson. He thought that the principle Mr. Bilson had set forth was that Norman vaulting in England had been of an independent character. Normandy architecture was behind the rest of Europe in the early years of the eleventh century, compared with the rest of France.

Mr. Francis Bond, in seconding the vote of thanks, said that if Mr. Bilson was right in his conclusions as to the chronology of the high vaults at Durham, then they must come to the conclusion that the architect of the choir vault, alleged to have been completed in 1104, was the very first to solve the great problem of Western Mediæval architecture—how to construct a ribbed vault, divided into oblong compartments, over a high nave set between low aisles and lighted by clerestory windows. But if so, how was it that no English architect availed himself of the Durham solution—with the exception of the builders of Lindisfarne, which was an appanage of Durham—till the closing years of the twelfth century? The weak point of Mr. Bilson's case was that it rested on a translation. The nave was stated to have been finished *ad sui usque testudinem* in the year 1128. If this meant "up to its vault," then the subsequent statement that the nave was completed by the monks in 1133 might be taken to mean that the vault of the nave was constructed between 1128 and 1133. But *testudo* was used of wooden roofs also, and not of stone vaults exclusively; which seemed to invalidate the whole hypothesis.

Mr. St. John Hope made some remarks about Norwich Cathedral, which he thought worthy of study, and Mr. E. W. Hudson called attention to the vaulting of the Priory of St. John's, Clerkenwell, with bold diagonal ribs, which he considered twenty-five years earlier than Rahere's ribless works of 1123 at St. Bartholomew's.

The vote of thanks was heartily agreed to, and in reply Mr. Bilson said that Mr. Spiers quite misunderstood him if he drew the conclusion that he desired to make England independent of Normandy. When Mr. Bond stated that his (the speaker's) conclusions involved the supposition that a Durham architect was the first to solve the great problem of Gothic architecture, was he not considerably overstating his point? To mention only one example in Normandy, the problem, as Mr. Bond had put it, was solved with unribbed vaults in the choir of Saint Nicolas, Caen, which was completed c. 1083, ten years before Durham was commenced. He admitted that his views as to the dates of the high vaults at Durham were opposed to preconceived ideas, but careful study of the building and the evidence had convinced him that the conclusions he had put forward must in the main be accepted. The vaults were obviously of various dates, and it was quite impossible to attribute them, with the chapter-house vault and the high vaults of Lindisfarne, to Bishop

Pudsey, as Mr. Bond had suggested in a recent book. They were entirely different character, and palpably earlier than Pudsey's works, of which we had several notable examples.

## A NEW BRIDGE AT VENICE

BY ALFREDO MELANI.

THE necessity for a new bridge over the Laguna at Venice has been under discussion now for some time, and the site all but been determined. It should be somewhere between the extreme point of the Ca' and San Guiliam di Mestre. Now to construct a bridge over the Venetian lagoon is a very different matter from building one in any other city. The city of the Doges must respect the rights of art and also its characteristic physiognomy; it is therefore not unnatural that the idea of a new bridge should have many opponents, and should be the subject of many heated discussions. It is needless to say that the most violent of these opponents are artists. This opposition on the part of the artist, both here and elsewhere, is praiseworthy, provided it is not directed against the free development of the requirements of modern life; for, to respect antique is just, but the exaggeration of respect is reprehensible. On the whole, the necessity for a new bridge at Venice can be denied, but at the same time it is to be hoped that the structure will correspond to the artistic exigencies of the place, for though it will be a work of public utility, it should be at the same time a public monument—a work of art. Three designs have been submitted: the first from the offices of Savignano, second from the engineer Chicchi of Padua, and the third from the Architect Speranza of Rome. I do not know how far either of these respects the artistic exigencies of the city, but, however, that none of these were discussed, because the question of the bridge was suspended by a prudent decision of the Communal Council of the city, which invites new studies before definitely voting a measure. The cause of the deliberation is the great influence of the opinion of Venetian artists who assembled in order to discuss the question. They were not unanimous however, there was a division in which they specified their ideas in two orders of day; in the first of which they affirmed the necessity, that if a bridge must be erected the artistic right of Venice should be respected. The second, voted by the minority, declared the necessity of a bridge, declaring that "it would cause a grave alteration in the aspect of the city." I believe that such an opinion of Ruskin and also of many other England who are enamoured of Venice who may now rest assured that—according to the general opinion—the question of the bridge over the Laguna has been indefinitely shelved. At any rate the project, after deliberation of the Communal Council, will not be modified, and will not be discussed, it be of artistic value. The supporters of the project who demand *in extremis* a new vault to the *terra firma*—like Oswald in "Ghosts" who cries out for the sun—are obliged to modify their idea.

Beith Parish Church was opened on Monday last week. It will hold 600 people and has cost £1660. The architect is Mr. Snodgrass.

The Central Meat Markets, London, is stated, have been weakened by the action of the steam and destructive gases from the thousands of trains that pass and pass beneath the markets during the week according to the "City Press," there is no need to believe the rumour that the markets are likely at any moment to disappear in tunnels beneath. In places where the work supporting the fabric above has been weakened by the action of the gases and series of brick tunnels and archways are erected.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### PROPOSED BUILDING EXTENSION.

In reply to "A. B." (South Devon): The fifty-fourth bye-law prohibits the erection of a building such as proposed without having at the rise an open space, exclusively belonging to the building, of 150 square feet at least, and from 10ft. to 25ft. wide, according to the height of the building. The proposed plan seems clearly to violate these rules. The bye-laws do not limit the height to which the building may be raised.

A. H.

## DEFECTS IN PLASTER WORK.

*To the Editor of THE BUILDERS' JOURNAL.*

DEAR SIR,—Will you kindly answer the following question relating to plaster work: We found the stone lime broken away from the pricking up, not from the lath, which retained the key properly. We shall be glad to be advised whether it was the material that was wrong; the gauging and workmanship was all right. S. AND F. S.  
Yarmouth.

Yarmouth.

It is somewhat difficult to determine the cause of breakage without seeing the work; but it may be due to various causes: 1. The pricking up may not have been properly keyed—i.e., scratched—to retain the floating and setting coats; 2. The pricking up may have been dusty or too dry, or the suction too great to afford a good and retentive ground for the floating coat. Either of the above defects, singly or in combination, would have a tendency to failure of cohesion of the first and second coats.

W. MILLAR.

### MEANING OF "PRIME COST."

*To the Editor of THE BUILDERS' JOURNAL.*

DEAR SIR,—Will you kindly explain to me in the columns of the BUILDERS' JOURNAL, the exact meaning of the words "Prime Cost," used in a specification. Is prime cost the net or list price?—Yours truly,  
Hatfield. F. G. B.

Hatfield.

F. G. B.

The R.I.B.A., conditions for building contracts include the following clause respecting Prime Cost. "The words 'Prime Cost' or the initials P.C., applied in the specification to goods to be obtained and fixed by the contractor, shall mean, unless otherwise stated in the specification, the sum paid to the merchant after deducting all trade discount for such goods in the ordinary course of delivery, but not deducting discount for cash, and such sum shall be exclusive of special carriage, the cost of fixing, and contractor's profit." It is in all cases advisable to specify exactly what is meant by Prime Cost in order to avoid any possibility of dispute.

## SURVEYORSHIPS IN THE ROYAL ENGINEERS.

*To the Editor of THE BUILDERS' JOURNAL.*

DEAR SIR,—Will you kindly let me know, through your columns, the qualifications necessary for candidates to enter the Royal Engineers, what examinations it would be necessary to pass, also the salary?—Yours truly,  
A. S.

uly,

Official particulars of the examination for Assistant Surveyors in the Royal Engineers can be obtained gratis from the Secretary, Civil Service Commissioners, Cannon Row, S.W. Candidates must be between twenty-one and thirty years of age, must have served for at least three years in the office of an architect, civil engineer, surveyor, or builder, and must produce evidence to show that they have profited by this training. The salary commences at £180 a year, rising at the rate

of £10 each year till £280 is reached, after which further promotion is usual, though it may be delayed, with a usual maximum of £600 a year, while there are a few more highly paid posts. Retirement at sixty-five years of age is compulsory, with pension for the rest of life at the rate of as many sixtieths of the pay being received at date of retirement as the surveyor has been years in the service, with a maximum of forty-sixtieths. G. A. T. M.

## Correspondence.

## FOUNDATIONS FOR FACTORIES.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Since my second letter appeared in your issue of March 15th (p. 91), it has occurred to me that some of your younger readers may be misled by a remark therein, which is illustrated by a little sketch, regarding the spread of vertical pressure. I mentioned, as a matter of argument, twice the thickness of the concrete as the extreme limit of actual spread of pressure, and that, of course, would only be possible in exceptionally good concrete. As a matter of precaution, I should have added that the *safe* limit of spread is much less, and is that defined by an angle of 45 deg., *i.e.*, that the projection (DE in the sketch) of the concrete should not exceed its own thickness. I always keep well within

that limit, even with cement concrete. If it is necessary to have a larger area than the angle gives, either (1) the concrete can be thickened, giving the enlarged projection F B, or (2) the iron base which must, under any circumstances, be large enough to meet the safe crushing resistance of the concrete per foot, can be spread to A, so that the same spread D C is reached by the same angle A C, or (3) iron joists can be embedded near the bottom of concrete; but this is serviceable only in the best cement concrete. Many considerations arise out of this last method, with which, however, I will not trouble you now.

J.D.

*To the Editor of THE BUILDERS' JOURNAL.*

SIR,—In replying to J. D.'s first letter on this subject, I had no desire to depreciate the value either of his theories or his experiments. In that letter he appeared to me to dogmatically assert as a fact, and not merely as an opinion, that the employment of a continuous and substantial bed of concrete on a soft soil where great weights have to be carried is calculated to ensure settlements in the building.

My reply was only intended to controvert his statement by recording personal experiences where this method of procedure had been adopted without the injurious results foreshadowed by J. D.

I agree that the pressure on the site according to my plan cannot be mathematically uniform, and in using the word "uniform" in my paper, I intended the term to be used in a comparative sense.

I quite understand that it is possible as J. D. alleges to proportion the foundations respec-

tively to the loads to be carried, if these can be determined with accuracy; but it is for the reason that the various and respective loads cannot, I maintain, in practice, be fixed with anything approaching strict accuracy that I prefer to depend upon the continuous and substantial bed of concrete, thereby obtaining additional bearing surface on the ground, and consequently a wider distribution of pressure thereon, although this distribution must admittedly be dependent upon the quality and thickness of the concrete.

This method of distributing the load will be effective, in my judgment, in all buildings where the columns carrying the floor beams are spaced at the usual intervals, which invariably range, where heavy weights have to be carried, from 12ft. to 13ft. In exceptional distances, between the columns as illustrated by J. D. in his diagrams, I should, to ensure distribution of the pressure to further points, embed steel girders in the concrete.

I should like to say that I know an instance of a seed warehouse of five floors which was built upon soft ground, with varying and substantial beds of concrete, in the manner advocated by J. D. The floor columns were uniformly distributed at intervals of about 13ft. A material subsidence occurred under some of the columns after the floors were loaded, with the result that all the floors were more or less crippled. It is my opinion that if a continuous and sufficient bed of concrete had been put over the whole site, and yet of a considerably less thickness than was placed under the individual columns, these unequal settlements would not have occurred.—Yours truly,  
J. H. PEARSON.

## NATIONAL CONTROL OF BRITISH LAND.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The “Housing of the Working Classes” and “Britain’s Food Supply” are surging to the front as urgent national questions. The ownership and use of every acre of agricultural land and of every square yard of building land within the narrow limits of this “tight little island” should, in my opinion, be under legislative (national) control. It is to the interest of the nation generally and individually that all who claim ownership of agricultural land shall be responsible to the Legislature:

- (1) That such land be cultivated so as to augment, in the highest possible degree, the quantity and quality of the food supply of the people.
- (2) That in its cultivation the full proportion of labour shall be employed.

And as to building land:

That on each plot there shall be erected houses, commodious, well drained, well ventilated, and well lighted, the best suited to the requirements of those who will of necessity inhabit them.

By the Prussian Land Act of 1881 the owner who neglects to so cultivate the land as to ensure the most abundant produce, or who does not employ adequate agricultural labour, forfeits his right to continued ownership thereof, the Legislature steps in, sells the land, and hands over the proceeds to the recent negligent or incapable owner, who can invest his capital in a manner more congenial to his tastes and capabilities.

In New South Wales a similar law exists as to mining land, whereby it is enforced that the amount of labour employed shall be in due proportion to the extent of the mine. The same principle can be readily applied to building land in this country by conferring on our county councils "compulsory purchasing powers."

In many parts of London and in other British towns and cities there are broad open streets, bordered on either side by mere "cupboards" of houses, small rooms, low ceilings, bad ventilation, and but little light, thoroughly unwholesome dwellings. Why should the owners be allowed to continue to let for profit these unwholesome dwellings, any more than the baker be allowed to sell unwholesome bread?

The greater part of these so-called houses

are near the end of their leases, and the repairs which can be legally enforced immediately, or in a few years, will consume the whole of (or more than) the rent of the now remaining period. These tenements, purchased at an official valuation under compulsory powers, would cost but little, and upon their sites the councils could enforce the erection of houses fit for human habitation. A public meeting will shortly be held in London by the "Working Men's Home Union" to fully discuss this important question, to which meeting tenants, landlords, councillors, and others from all parts of Britain will be heartily welcomed.—Your obedient servant,

JAMES HAYSMAN,

President "Working Men's Home Union."  
Finchley Road, Hampstead, London.

## COTTAGE HOMES AT MIDDLEWOOD, NEAR ROCHDALE.

By ESTHER WOOD AND G. LL. MORRIS.

(Continued from page 103.)

THE girls' cottages (Figs. 11, 12, 13, 14) in the Middlewood Settlement differ in plan from the boys', but have the same general arrangement of rooms; the ground floor being

particular purpose. It is, of course, quite possible to criticise certain of the arrangements, but it will be found generally that such alterations mean some corresponding drawback rather greater than less in degree. The girls' home is not quite so satisfactory, the long and straggling hall and the large landing on the first floor are points that might possibly have been improved upon. The principal bedrooms, however, are well placed, and, like both the boys' home and the Receiving Home have cross lighting and ventilation, a thing to be desired. A pass door on one side of the fireplace of the large central bedrooms, answers the same purpose as that in the Boys' Cottages.

In the planning of Cottage Homes, there still exists some difference of opinion among Poor Law Guardians about the number to be housed in each dwelling. Many Boards of Guardians have found from experience that eighteen to twenty are too many, and that the number should not exceed twelve, or at the most fifteen. Twelve is the number agreed upon by the Rochdale Guardians, and it may safely be assumed that there is less likelihood of the children being treated too much *en masse*, as must happen when the members are increased. The cost of administration is more, but the chance of the Homes becoming remedial of pauperism is greater, and unless they fulfil this purpose—the object of their erection—the whole idea underlying the

possible for two children to use the same water for washing; the lavatories consisting of two deep sloping slate slabs, resting on a porcelain channel, the children not being able to get any water except from the running lever taps, with rose outlets. The slate slabs are provided to prevent the splash, and the channel to act as a waste. The floors of both lavatories and bath rooms are tiled, and also the dadoes to a height of 3ft. 6in. This may seem extravagant, but it is very desirable from a sanitary point of view, and possibly in the end more economical. The continual re-newing of the paint on the walls would soon exceed the extra cost of tiles and, as the plaster in such rooms gets very easily knocked and damaged, an untidy appearance would soon be given to these rooms.

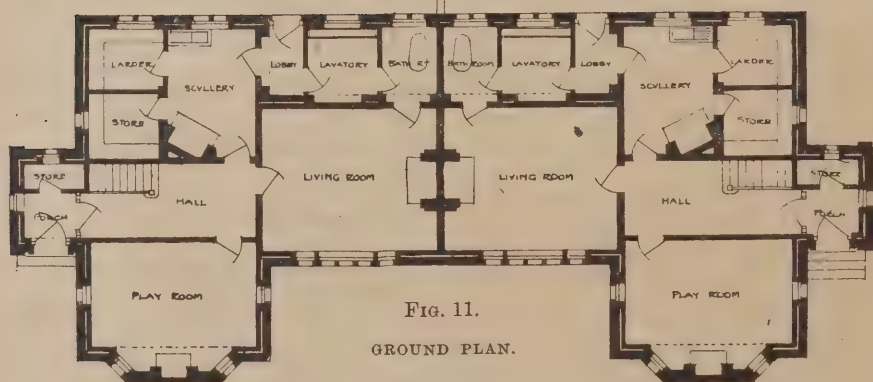

Fire-places are so skilfully planned that the flues nearly always gather together in the middle of the ridge, or very near it; by this means the warmth of the building is increased when the fires are alight, the hot air travelling up through the centre of the buildings. The internal wood is of varnished pitch pine, as it can be easily kept clean; painted woodwork, however, or pitch pine stained, would have been preferable; the extra labour involved is little, and of its more pleasant appearance there is no question.

Ventilation, especially that of the bedrooms, is provided by special inlet tubes and extracting flues, and air is also admitted behind the transoms of all windows by a hit and miss arrangement. In the bedrooms the windows are on opposite sides of the rooms, and carried as dormers right up to the ceiling.

The washhouse and out-offices are situated in the rear of each semi-detached block. It is suggested by some guardians that this prevents the possibility of the foster mothers disagreeing over the condition of the washhouse as is sometimes the case when one washhouse is provided for two cottages.

The closets are on the pail system, and the soil will be used upon the land. Main sewers are laid in the two roads, each cottage connected, but having disconnecting traps before entering the sewers. At the head of the main sewer is an automatic flushing chamber. The sewers discharge into settling and precipitating tanks, the solids being precipitated, and the clear effluent overflowing into a present brook drain. No drains enter any of the houses, and manholes for cleaning and inspection purposes are placed at the change of direction in the drains. Good water is obtained on the site from springs, and a small reservoir will be formed on the high lands, from which water will flow to all the homes. The homes will be lighted by the electric light, and the current will be brought over the hill from the workhouse by means of overhead wires.

The cottages are well built, the outside walls being constructed with a cavity—the outer portion being faced with Yorkshire pitch-face par points, and lined with brick; on the other side of cavity is the four-and-a-half brick wall. Externally the buildings present a more picturesque appearance than is usual, harmonising fairly well with the surrounding district. Stone is used chiefly, and the whole of the roof—covered with blue slate—overhangs the walls both at the eaves and the gables. Passing round the site we feel that these cottages might with a very little additional outlay have been built still more in character with the surrounding moorland country. Instead of the pitch faced par points, which in reality are so ugly, and yet are used so frequently now-a-days in this district, how much more beauty would have been gained by building the walls like the cottages and manor halls of an earlier age: smooth face par points varying in width or beginning moderately large at the base and getting smaller towards the top—with colossal bonding stones at the angles, and possibly stone copings and stone slating if the money would have allowed. These would have given the cottages a character which they now seem just to miss. Notwithstanding this criticism the whole scheme, both from a practical and in a less degree from an artistic point of view, is far in advance of the great majority of cottage homes.

GIRLS' HOME. MESSRS. BUTTERWORTH AND DUNCAN, ARCHITECTS.

occupied by the play room, large kitchen or living room, scullery, bath room, larder, and lobbies; while the upper story has its two principal bedrooms holding eight and four respectively, and its spare room and mother's room.

There is little criticism to be made upon the boys' homes, both ground and first floor are as near perfection as they can well be for their

Homes becomes of no avail. An increased outlay now upon small homes is likely to be more effective in the long run than a smaller outlay upon larger but fewer homes, less costly in administration. It would be as well for guardians to bear this in mind.

Some of the practical details for the working of the cottages are interesting. The architects have taken special precaution to make it im-

# THE ARCHITECTURAL ASSOCIATION.

## REFLECTIONS ON THE ENGLISH RENAISSANCE.

By REGINALD T. BLOMFIELD.

(Continued from page 102.)

THE discussion following Mr. Blomfield's paper was opened by the President (Mr. G. H. Fellowes Prynne) who said that they had all listened with great enjoyment to a paper they had been looking forward to for a long time. He thought the paper was worthy of a good discussion. Mr. Blomfield had clearly shown that by a full knowledge was accomplished good work.

Mr. L. A. Shuffrey briefly seconded the vote of thanks.

Mr. A. T. Bolton thanked Mr. Blomfield not only for his paper, but for the excellent drawings he had exhibited. Mr. Bolton contended that craftsmanship was not the only thing to consider, but the principles of Architecture. For in those buildings on the Acropolis at Athens were all rubbed down by slave labour, yet how fine they were. In St. Paul's, Covent Garden, by Inigo Jones, his craftsmanship was not that which remained, for the church has been so much altered. For all that the power of the design still remained. There was something more than craftsmanship about it to give it its present beauty. Facts such as these, he considered, went a long way to diminish the importance of the craftsmanship idea. He did not consider an age of machinery fatal to Architecture, although the craftsmanship would be better present. Mr. Blomfield had not referred to one defect of the Anglo-

to hear such a paper in the metropolis. Looking around on the metropolis what did one see. There was a cathedral, St. Paul's. One saw a set of craftsmen practically spoiling the Architecture. What right had any portion of the British people to call in a man, however eminent (and no one wished to say a word against any man of genius as such), to spoil magnificent Architecture? Again, looking westward, one saw a bridge, shortly to be built. A bridge over the Thames, and in such a city as London, should, above and beyond most things, be a work of Architecture, not only a means of crossing from one side to another. But where was the architect? Supposing a body of architects did interfere with the engineer, who was justly to be considered a craftsman, for he daubs on ornament, how were they treated? He wished that some of Mr. Blomfield's general principles could be driven into those people who had the control of public buildings.

FIG. 13.

FIG. 14.

FIG. 13 FRONT ELEVATION, AND FIG. 14 BACK ELEVATION, OF GIRLS' HOME. MESSRS. BUTTERWORTH AND DUNCAN, ARCHITECTS.

Mr. Leonard Stokes said that the President had thought the paper worthy of discussion; well, all he could say was "Ditto, ditto," to everything. The men who thought that without knowledge they would be original were the curse of their generation. If they only knew a little more they would do a good deal less, to the benefit of everybody. Mr. Blomfield had not disparaged craftsmanship, but he had truly said, this was not everything. An architect ought to have a better knowledge of crafts than the workmen, for he went about more than they, and was able to grasp the principle of the work. Mr. Blomfield had said something to the effect that Architecture was not merely ornament; they might have thought this was obvious, but it was not. He, himself, was always saying to his assistants "Grasp a few principles." He advised his hearers to hang such texts up in their bedrooms, or where they could not help coming across them. He concluded by proposing a hearty vote of thanks to Mr. Blomfield.

Classic school, which was not very successful in the treatment of the ordinary small house. There had been a wonderful development in the modern villa house, and Mr. Norman Shaw had put them upon the right path. He did not think that the progressive character of Architecture during the Renaissance had been sufficiently dealt with. A good deal could be learnt from it. The Renaissance architects had solved many problems in an admirable way, such as the use of the dome.

Mr. A. H. Hart expressed dissent from the statements made as to originality being lost by too much study. He considered a great deal of study of old work was necessary, and the man who had most familiarity with that work was most likely to be original in his own. The time spent in study would well be repaid.

Mr. G. J. T. Reavell said that he was glad to hear general principles laid down. Up till then he never had heard any, but Mr. Blomfield had taught them a great deal.

Mr. C. H. Brodie said that it was wonderful

Mr. M. Garbutt thought that the people responsible for the decoration of St. Paul's were not wholly to blame. If the present decorators had been replaced by an architect, was there one who had had sufficient training in colour? In regard to Vauxhall Bridge, none of the critics of the design had given a sketch showing how to do it. The engineer was asked to design a bridge with some architectural pretensions, and he had no doubt done his best.

Mr. G. H. Fellowes Prynne, in summing up, said Mr. Stokes asked what there was to disagree with. Well, he had thought that some criticism would be called up by the despondent tone of the lecturer in speaking of modern Architecture. He (the speaker) thought that there was a glimmer of hope among this chaos, for chaos it was, and they should not be disheartened. Originality was to be got in the end by the study of the old Architecture. He thought the complaint about the destruction of the Architecture of St. Paul's would not

appeal to the general public. He hoped the work of destruction would be put an end to. He then put the vote of thanks, which was carried with acclamation.

Mr. R. T. Blomfield, in reply, said many interesting points had been brought forward by the discussion. Mr. Stokes had put his (the speaker's) remarks in a nutshell. What he understood him to say was that an architect's craft should be his own craft. An architect was the master mind, and should master all the crafts in their relation to each other. He thought there was a great deal to study in eighteenth century work, of which there was a large quantity of quite small work all about England. What Mr. Bolton had said about the Italian building was very valuable. If in Rome one could divest oneself from the obtrusion of the large amount of trumpery ornament, there was much in the building which was very fine. Mr. Bolton had clearly pointed out that a fine effect was to be got apart from the conditions of craftsmanship. If in Architecture a problem was really solved, it would stand the wear of any time. Originality, he thought, was to a great extent a misconception. It was the gift of God—not a thing to be acquired, though, of course, the gift could be developed. Modern architecture could not be arrived at through craftsmanship. An architect should always be studying, with an idea not of heaping up knowledge, but of mastering a method of expression of his own ideas.

The President announced that the annual soirée would take place at St. George's Hall, Langham Place, on April 21st. The ladies' night would be on April 19th. The next lecture would be read on April 14th by Mr. F. W. Pomeroy, on "Modelling as Applied to Architecture," with practical demonstrations.

## Keystones.

**A New Wesleyan Chapel** is to be erected at Newhall, at a cost of £5000 to £6000.

**The Site of the Stirling Public Library** is to be in a new road which will run through the Corn Exchange Square.

**A section of scaffolding gave way** last week at Messrs. W. D. and H. O. Wills's new factory at Ashtongate, Bristol, and one man was killed, while two others were injured.

**New London County Council Buildings.**—The L.C.C. has decided to purchase, at a cost of £100,000, the freehold interest in Nos. 26 and 27, Cockspur Street, so as to erect better accommodation for its staff.

**A new nurse's house** was opened on Wednesday last in connection with the Hospital for Sick Children, London. For the purposes of the house the adjoining Hospital of St. John and St. Elizabeth had to be acquired in May, 1898, at a cost of £30,000.

**The Cause of the Sewer Fatality**—An inquest was held, on Thursday last, on the two men whose death we recorded last week. Mr. Montgomery, brother of one of the deceased men, gave evidence to the effect that the sand through which they were working was treacherous, and some undercurrent probably loosened the struts, with the result that the sides fell in. Mr. G. F. Ellis, assistant surveyor to the St. Pancras Vestry, stated in his evidence that on the day of the accident he observed that there was no skeleton frame at the top of the runners as there should have been, and the error was, in his opinion, the too quick removal of the runners, which set free the sand, dislodged the struts, and caused the collapse. Mr. W. N. Blair, surveyor to the vestry, said that it would have been well to have left the runners fixed even after the filling in was done; but if removed at all, these supports which kept back the shifting sand, should have been removed very carefully and slowly. The jury returned a verdict of accidental death in both cases, and expressed the opinion that the runners supporting the bottom portion of the trench were too hurriedly drawn, thus causing the sides of the cutting to fall in.

## R.I.B.A. STUDENTSHIPS AND PRIZES, 1899-1900.

**THE** list of subjects for competitions in 1899-1900 has just been issued, and is as follows:—

For the Royal Institute Silver Medal and 25 guineas for Essays: A Review of the Architecture of the Elizabethan Period (about 1550-1620).

For the Royal Institute Silver Medal and 10 guineas for Measured Drawings: Drawings of any important buildings, classical or mediæval, in the United Kingdom or abroad. Subjects suggested as worthy of illustration.—One of the Colleges of Oxford or Cambridge; (Scotland) Holyrood Palace, Edinburgh; Jedburgh Abbey; (Wales) Chirk Castle, Denbighshire; (Ireland) Cashel Cathedral, or any Monastic Building; (London) St. Alphege, Greenwich; St. George's, Hanover Square; The Confessor's Shrine and the Tomb of Edward III., Westminster Abbey; All Hallows, Barking; The West Portico of St. Paul's Cathedral; St. Mary Woolnoth; St. Mary-le-Strand; (Cambridgeshire) The Lady Chapel, Ely; (Derbyshire) Ashbourne Church; Bolsover Castle; (Dorsetshire) Barn. at Abbotsbury; Manor House, Athelhampton; (Gloucestershire) Redland Chapel, Clifton, Bristol; (Hampshire) Bramshill; Christchurch Priory; Romsey Abbey; (Lancashire) Bramhall Hall; (Monmouthshire) Chepstow Castle; (Northumberland) Ruined Buildings at Lindisfarne; (Norwich) St. Peter's Mancroft; (Nottinghamshire) Steeple at Newark; (Oxfordshire) Burford Priory; (Somersetshire) The Chapter House and the Lady Chapel, Wells; St. Cuthbert's Parish Church, Wells; (Staffordshire) The Lady Chapel, Lichfield; (Surrey) Sutton Place, near Guildford; (Sussex) Cowdray House, Midhurst; (Worcestershire) Pershore Abbey, near Worcester.

For the Soane Medallion and £100: Design for a School of Fine Art, placed in a park, or public garden. The accommodation to include approximately:—

Entrance hall and staircase, about 2600 sq. ft.; Office and council room, about 1500 sq. ft.; Lecture room, about 1700 sq. ft.; Museum or gallery of casts, about 2800 sq. ft.; Two class rooms (Architecture), together about 2800 sq. ft.; Two class rooms (Sculpture), together about 2800 sq. ft.; Two class rooms (Painting), together about 2800 sq. ft.; Life school and models' room, about 1000 sq. ft.; Three rooms for professors, each about 500 sq. ft.; Large hall for exhibitions, meetings, &c., about 4000 sq. ft., with ante-room and one small room, extra; Library, reading room and librarian's room, together about 3250 sq. ft.; Main corridors to be 8ft. wide. The basement story to contain lavatories and cloak-rooms for each sex, storerooms, rooms for heating and electric lighting installation, residence for caretakers, rooms for attendants, refreshment rooms.

For the Pugin Travelling Studentship (Silver Medal and £40): Selection of drawings (with testimonials) illustrating the mediæval architecture of Great Britain and Ireland.

For the Godwin Bursary (Silver Medal and £40): Selection of practical working drawings, or other evidence of special practical knowledge, and testimonials.

For the Owen Jones Studentship (Certificate and £100): Testimonies of acquaintance with colour decorations; successful candidate to submit an original design by December 23rd, 1901, for the coloured decoration of one bay of one of the aisles of the nave of St. Paul's Cathedral.

For the Tite Prize (Certificate and £30): Design for an isolated clock tower and belfry in a public place, the centre of the clock dial to be about 60ft. from the ground.

For the Grissell Prize (Gold Medal and ten guineas): Design for a spiral staircase entirely of stone, carried on vaulting in a circular hall or tower, having an internal diameter of 35ft. The clear width of the stairs to be 8ft. The staircase to rise from the ground to the second floor; the total height from ground to second floor not to exceed 40ft. The top storey to be vaulted over, the height being optional. The lighting to be from windows.

A pamphlet containing further particulars for the guidance of intending competitors can be obtained from the Secretary, Royal Institute of British Architects, 9, Conduit Street, London, W.; price (to non members) 3d.

## Professional Practice.

**Aberdeen.**—A new chapel is to be erected at Blair's Cottage in connection with a scheme of extension which is being carried out at the college. It will stand on the east side of the college buildings. The spire will rise to the height of 150ft., and the entire work, chapel and spire, will be in Aberdeen granite. The chapel is to cost about £12,000, and the new buildings, as a whole, are to cost £40,000. The architect for the buildings, apart from the chapel, is Mr. R. G. Wilson.

**Dundee.**—A villa is proposed to be erected by Mr. H. T. Munro, of Lindertis, on the south side of the road between Kirriemuir and Craigton. The house has been arranged with a long frontage, giving all the rooms a southern exposure. The stones are to be taken from the Lindertis Quarry, and the house will be built of rubble and harled with margins of stone round the doors and windows. The roof will be covered with American green slates, so as to give variety in colour to the general appearance of the building. The architect is Mr. J. Murray Robertson, Dundee, and the contractors are:—Mason, Messrs. Watterson and Son, Forfar; joiner, Mr. Charles Ogilvie, Kirriemuir; plumber, Mr. D. Brown, Dundee; slater, Mr. J. Walker, Alyth; and glazier, Mr. Savege, Kirriemuir.

**Dagenham, Essex.**—The County Borough of West Ham, having acquired the Rookery Farm at Dagenham, Essex, 116 acres in extent, have isolated a space of 3½ acres on which they have erected a smallpox hospital from designs prepared by Mr. Lewis Angell, the borough engineer and architect. The hospital has the following accommodation:—An entrance lodge and offices; an administration block, including the medical officer's and matron's rooms, twenty-eight bedrooms for nurses and attendants, mess rooms, dispensary, kitchen, laundry, and other offices; two pavilions containing four wards, each ward 60ft. long by 26ft. wide, also a receiving room, bathrooms, nurses duty rooms and sanitary annexes; isolation block for four beds and offices; discharging block, laundry, disinfecting chamber, and mortuary; the hospital will accommodate forty-four patients and necessary staff. The materials used are stock bricks with Portland stone and red brick dressings. The buildings have cost about £17,000 exclusive of site. Messrs. Gregar and Sons of Stratford were the contractors.

**Kilbarchan.**—A parish church is to be erected, and a joint committee have accepted the tenders of the following contractors:—Mason and joiner, Mr. J. Woodrow, of Bridge-of-Weir; slaters, Messrs. Keenan and Kelso, of Paisley; plumber, Mr. J. Fleming, of Paisley; plasterers, Messrs. George Thomson and Son, of Johnstone; glaziers, Messrs. Tytler and Son, of Greenock. The architect is Mr. W. H. Howie, I.A., of 131, West Regent Street, Glasgow. The church is estimated to cost upwards of £6000.

**London, S.W.**—The enlargements at St. John's College, Battersea, will consist of new kitchen quarters, a new college hall to accommodate 132 students and 15 masters, a new wing to hold 40 students with masters' and servants' quarters and bathrooms, a lecture theatre, classrooms, a workshop, a modelling room, and art room, and a physical laboratory. The whole of the existing buildings are to be remodelled. Mr. A. H. Ryan Tenison, of 7, Great College Street, Westminster, S.W., is the architect, and Messrs. C. J. Mann and Sons, of 29, Great George Street, Westminster, S.W., the quantity surveyors.

# Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

March 29th 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

## Design for a Country House.

THE design for a house which forms one of one inset plates this week, was prepared by Mr. George Wittet and obtained the first prize in a competition promoted by the Perth Architectural Association. The building was to be of stone and to be suited to a hilly district. The elevations are treated in a simple manner with large wall spaces, especially on the north or entrance front. The ground floor consists of dining-room, drawing-room, hall, and kitchen offices. Cloak and lavatory accommodation is provided at the entrance. The hall with the staircase is made an important feature. It is well lit and has a fireplace with handsome chimney-piece, and could be utilised as a gentlemen's smoking-room or lounge. On the upper floor there are four good sized bedrooms and one dressing-room; with bathroom and linen-room, &c., the servants' apartments and lumber-room being arranged in an attic floor.

## Builders and the London Government Bill.

WITH the purely political aspects of the London Government Bill, now before Parliament, this journal is not concerned. But some of its provisions very closely affect the practice of architects, surveyors and builders, and upon these it is quite within our province to express an opinion. That opinion is—and we think it is shared by the majority of builders—that unless the bill is amended in some very important details, it will inflict serious injury and inconvenience upon all who are concerned in the supervision or carrying out of building in the metropolis. The proposal to transfer from the County Council to the new borough councils the administration of the Building Acts, is one of the most objectionable features of the bill. If adopted, it will effectually do away with uniformity of administration.

## A Typical Opinion.

MR. HENRY HOLLOWAY, one of the largest builders in London, in a recent interview, pointed out very clearly how this would affect the builders. "The Building Act Committee of the London County Council," said Mr. Holloway, "administer the Building Acts in the hole of London. It is advised by an experienced expert in the person of its architect. His interpretation of the Acts will be the same as Fulham as for Finsbury, for Woolwich as for Westminster. Now see what will happen these proposed new Councils are called upon to administer the Acts. They will be advised by their surveyors. What will the builders do? Take the case of our own firm. We find that one clause or sentence in the Building Acts is interpreted in one way by the surveyor of Westminster, in another by the surveyor of Woolwich, and in yet another way Whitechapel, and so on, in all of which cases we may be putting up buildings." The condition of the poor builder who has to

comply with the varying requirements of all the different authorities Mr. Holloway could only express in the classic phrase, "E won't know where 'e are."

## The Surveyors' Objections.

THE building clauses of the bill do not commend themselves to the surveyors any more than to the builders. A petition to the House of Commons against the bill has been drawn up by the District Surveyors' Association. The petitioners feel that "their official, personal, and private rights and interests, as well as their ability to discharge their duties in administering the London Building Act 1894, will be very materially and prejudicially affected if the bill becomes law in its present form." They object to the proposed transfer of powers to the new borough councils, pointing out, amongst other considerations, that the local councils will probably contain among their members builders and owners of property, and that it will manifestly be very difficult for a district surveyor to enforce the provisions of the Building Act against a member of the borough council; they suggest that the bill should be amended so as to prevent the borough councils having the power of appointment, control and dismissal of the district surveyors. The petition concludes with a reference to the importance of uniformity of administration which the bill would destroy. "In the hands of the central authority an evenness of administration of the discretionary powers is secured that would be impossible in the hands of a number of local authorities, who would each exercise the control in their own way irrespective of what was done in other parts of London."

## The L.C.C. and its Architect.

IT has no doubt struck many people as a curious thing that the offer by the London County Council of £1500 a year for the services of a superintending architect failed to attract candidates of very high qualifications, and that, in order to obtain the man they wanted, the Council should have found it necessary to increase the offer to £2000 a year. Some may have been inclined to draw the erroneous inference that architects, as a body, earn such huge incomes that £1500 a year is a mere trifle in their eyes. Mr. Thomas G. Jackson, R.A., in a letter to the "Times," suggests a reason which, if correct, strikes us as one that is very creditable to the profession. The duties of the office, he says, consist so largely in enforcing County Council rules with regard to building and sanitary matters, and give so little scope for the display of architectural abilities, that an architect who loves his work will not be tempted by a large salary to resign it for such humdrum tasks. Mr. Jackson makes the suggestion that a competent surveyor should be appointed to perform the routine duties of the office, and that when artistic matters are under consideration the Council should call in some artist from outside—architect, sculptor, or painter—and so get the best advice the profession of art can give. This suggestion, as we now know, has not been acted upon, but the appointment of Mr. W. E. Riley does not, we hope, preclude the Council from following out Mr. Jackson's idea so far as to avail themselves, when occasion demands it, of the best artistic advice.

## Restorations at Winchester Cathedral.

FOR nearly three years the roof of Winchester Cathedral has been in the hands of builders, who have been giving it a thorough overhauling, and not before it was time. The ancient timber work was sadly decayed, and the stone vaulting beneath the nave was in a dangerous condition. The Society for the Protection of Ancient Buildings have expressed themselves entirely satisfied with the plans adopted by the architect, Mr. Colson, and the manner in which the work has been carried out by the contractors, Messrs. Thompson, of Peterborough. The great altar reredos has been completed at a cost of about £2000, and the dedication of the work was pronounced by the Dean last Friday.

## The Gladstone Memorial.

AT a meeting of the Executive Committee of the Gladstone Liberal Memorial Fund, presided over by Lord Tweedmouth, and held on Friday last, it was reported that subscriptions amounting to £3689 had been received through local collections, and £560 had been remitted direct to the central offices. The gross total up to date was £4249. The date fixed for closing this fund is April 15th next. Mr. F. W. Pomeroy, the sculptor, is making satisfactory progress upon the statue, and it is hoped that the work will be completed by the end of the year, in which case the opening of the next session of Parliament will witness the unveiling in the Central Lobby of the Houses of Parliament. With regard to the national fund, inquiries show that it has increased satisfactorily of late, and the total amount is upwards of £29,000.

## Art Students' Exhibition.

THE works submitted by candidates for the County Council's Technical Education Board's Art Scholarships and Exhibitions have been examined by Sir William Richmond and Mr. Selwyn Image, and a number of them were selected and exhibited at the Northampton Institute, St. John Street Road, Clerkenwell. The exhibits included architectural and art modelling designs in plaster of Paris, a memorial for an artillery monument, architectural plans, designs for frescoes, oak carving, and painted glass. As might be expected the work is for the most part crude; but there are plenty of signs of real merit. Good work has been done in friezes, overmantels, and figures, and some designs for architectural and building work have been well executed. In due course the board will issue its award.

## Cottage Homes.

THERE is a growing feeling that the "barrack schools," in which it has been customary to rear the unfortunate children who are dependent on the State for their maintenance, are but ill suited for their purpose. It is felt that some closer approximation to home life is what is needed, and consequently the decision of the Stepney Guardians to erect a new barrack school has evoked considerable protest. At a meeting held last week the following resolution, proposed by the Rev. A. Dalton, rector of Stepney, was carried unanimously: "That this meeting of ratepayers emphatically urges the Board of Guardians to provide some system for the children under their care which will secure the nearest possible approach to home life." The system of cottage homes, such as that now being described in our columns, seems to be the one that best meets the necessities of the case. The Stepney Guardians should read their BUILDERS' JOURNAL.

## An Automatic Telephone Exchange.

WE have received from the Telephone Construction Company Limited, of Winchester House, Old Broad Street, a book containing a technical description of their automatic telephone exchange system. It would be scarcely possible to explain the system clearly without the aid of drawings; but we may say that it seems to be a vast improvement on the ordinary systems. The company claim that by the use of their system any subscriber can at any time, whether by day or night, call up any other subscriber, and the time occupied in making such a call is from three to five seconds. This is certainly better than having to wait about the same number of minutes. In point of economy the system has a great advantage in the fact that only one man is required at the central establishment to look after every 1000 exchange instruments. This reduces the working expenses, and also gives increased speed in communication. The company state that when two subscribers are connected, no third person can interrupt or overhear the conversation. If this is so the annoyance of being suddenly "cut off," or interrupted by the familiar "have you got them?" will be spared to the users of the system.

## Under Discussion.

### THE COST OF ELECTRIC ENERGY.

At a meeting of the South Staffordshire Institute of Iron and Steel Works Managers at Dudley, on Saturday week, Mr. J. H. Whittaker, A.M.I.E.E., read a paper on "Electricity in Mines and Iron Works." In the discussion Mr. Addenbrooke said the Midland Electrical Corporation had decided that the three-phase system should be adopted. Local authorities and the Government, however, seemed to take a delight in putting every obstacle in the way of transmitting electrical power. Whilst Germany insisted upon overhead wires, the Board of Trade in England forbade them unless they were as much insulated as underground wires. The cost of that was practically prohibitive, and a more hopeless obstruction could hardly be conceived.—Mr. W. Brooks believed that it would be far better and cheaper for companies to lay down huge generating plants than for local authorities to put down small systems. If electricity could be supplied at 2d. per Board of Trade unit, it was cheaper than the 3d. per unit at which municipalities could do it.—Mr. Addenbrooke said the Midland Electrical Corporation intended to put down a 5000 horse-power station to start with, and their charges would be on the basis of a sliding scale. For mine pumping the charge would be less than 1d. per unit, and if the pumping was continued for twenty-two out of twenty-four hours they would be prepared to make a reduction on that figure; in fact, they would come down to 3d. per unit.

### ARCHITECTURE IN DUNDEE.

In connection with the student section of Dundee Institute of Architecture, Mr. A. H. Millar, F.S.A., Scot., delivered a lecture on "Dundee, Past and Present," in the Technical Institute last Saturday week. Mr. Millar, alluding to the mistaken idea that Dundee was a town of yesterday, said it had a corporate existence for at least 700 years, a charter of 1199 being in existence, conferring on its merchants the privilege of trading free in any English town or city excepting London. He proposed showing the Architecture of the present day, and comparing it with that of the past, the examples being from the fifteenth century onwards. In alluding to the Town House, designed by William Adam, and built in 1730-34, the lecturer spoke of the influence which it had exercised upon the Architecture of Dundee, many of the buildings

being planned on the same lines; notably St. Andrew's Church, the old Trades Hall, Union Hall, and Trinity House. The last three had now disappeared. He traced the development of the modern streets from the old closes, and explained how the names of these were frequently retained, although they seemed unintelligible at the present day. In touching on the modern buildings, Mr. Millar pointed out the want of coherence in many of the designs, each man erecting his own building with supreme indifference to those of his next-door neighbours, thus forming a curious jumble of styles. In Albert Square alone there could be seen examples of Greek, Flemish, Queen Anne, French Renaissance, Italian, and Gothic styles in juxtaposition. Of the High School, he mentioned that Mr. Angus, by whom it was designed, had planned the line of Reform Street for the purpose of making an approach; and in that connection Mr. Millar indicated his satisfaction that the intention of the architect was not to be destroyed, as it would have been had the Queen's statue been placed on the site at one time proposed. About 100 slides, illustrative of the lecture, were exhibited by limelight in such a manner that a tour was made through Dundee, and consecutive pictures were shown of the Murraygate and other places, chronologically arranged, so that the modern street was traced back to its origin.

### THE PURIFICATION OF PUBLIC WATER SUPPLIES.

At a meeting of the Civil and Mechanical Engineers' Society, held on March 16th, a paper on the "Purification of Public Water Supplies" was read by Mr. W. N. Twelvetrees, M.I.M.E., M.S.I., and was illustrated by a large number of diagrams. The chair was occupied by the President, Mr. B. Baines Dudley. After dealing with the question of natural and artificial purification, by percolation and by deposition, the author demonstrated by the aid of sectional drawings, the actual nature of the process taking place in sand filtration beds. Sand in itself presents no special recommendation as a filtrant; the efficiency of a sand filter does not become established until a gelatinous layer formed of mud, algae and micro-organisms has been formed upon the surface. Leaving ordinary sand filtration, Mr. Twelvetrees proceeded to discuss some modified methods which have been adopted with great success. One of these is known as the Morison-Jewell process, of which the distinctive feature consists in the substitution of a clean film of

gelatinous aluminium hydrate for the casually accumulated layer, constituting the chief purifying medium in ordinary filter beds. Another modified mode of sand filtration is one in which polarite, alone or mixed with sand, takes the place of one of the strata of sand. Polarite is the name given to a specially prepared and porous form of magnetic oxide of iron. Water passes freely through as well as around the granules of this substance within the pores of which polarised oxygen is contained, and which, upon contact with suspended or dissolved substances, produces oxidation. This action is not carried on at the expense of the material itself; and, further, as polarite is absolutely rustless, it is practically everlasting. Fresh supplies of oxygen are of course necessary, and periodical washing is also required. Methods of purification for hot and cold climates, where sand filtration is often impracticable, were next discussed and illustrated. Many forms of apparatus coming under this category show considerable mechanical ingenuity, and installations upon a large scale are noteworthy for the magnitude of their output as compared with the limited space required. Amongst filters of this kind may be specially mentioned the "Riddell," the "Torrent," the "Howatson," and the "Wilson" filters. These have all been applied for public purposes, and in installations capable of dealing with from 1,500,000 to 2,600,000 gallons of water per 24 hours. Mr. Twelvetrees next drew attention to the example of waterworks filtration by the Pasteur method, as used at Darjiling. The output is about 250,000 gallons daily, and as the Pasteur filtration employs the only known absolutely germ-proof medium, the installation in question may be regarded as unique. Sterilization by heat at a temperature of 240 degrees Fahr. affords perfect immunity from pathogenic bacteria, and an apparatus known as the Vailard-Desmaroux Heat Sterilizer was described and illustrated. This form of appliance has been adopted for the water supplies of towns in Russia and in Brazil. It should always be borne in mind, however, that the extinction of germs and spores is one matter, and that the removal or oxidation of poison in solution is another and not unimportant problem. Mr. Twelvetrees in conclusion emphasised the desirability of regarding efficiency as the first consideration in every case, and expressed the hope that the line of defence established by water engineers in the interests of public safety might always be furnished with weapons of the most modern and scientific kind. discussion followed.

### WOOD-BLOCK PAVING. (MR. WHITE'S SYSTEM.)

For Churches, Schools, Offices, &c.  
Estimates and full particulars on application to

### "Side Pattern."

For side of Window Frame.

Use  
"SIDE PATTERN"  
where possible.

Covered by 8 Patents.  
(Other Patents Pending.)

These valuable Balances for SLIDING SASHES can be applied to OLD as well as NEW WORK. Require no Box Frames, and dispense with Weights, Cords, and Pulleys.

The NEW STYLE is Better, Cheaper, Neater, and more Durable than the OLD.

Tested and Adopted by the London County Council.

### THE "Pullman" BALANCES. "Pullman"

Stands for "Made on Honor."  
"OLDEST IN YEARS, NEWEST IN IDEAS."

Adapted to OLD as well as NEW WORK. Attractive in Appearance. Easily Applied.

TELEPHONE 804 "HO"

### "Top Pattern."

For top of Window Frame.

Use  
"SIDE PATTERN"  
where possible.

Covered by 9 Patents.  
(Other Patents Pending.)

To be used where there is not room for "Side Pattern."

## Keystones.

Almshouses have been erected at Char-nock Richard by Mr. James Darlington, of Bourton Hall, Rugby.

The Paris Exhibition works are progressing slowly, and foreign workmen are being employed, so as to enable them to be completed in time.

A Protest against the Removal of Greyfriars Church has been sent to the Aberdeen Town Council by the Glasgow Architectural Association.

Present of a Stained Glass Window.—The German Emperor has offered to present a stained-glass window for the west end of Dovercourt Church, in memory of some German soldiers who died from the plague during the Continental war, and were buried in Dovercourt Churchyard.

The Extensions to the Ingham Infirmary, South Shields, are being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues.

Arbroath New Epidemic Hospital.—It has been decided to erect this hospital on the lands of Little Cairnie, and it is estimated that the hospital will cost about £8000. Competitive plans for the work are to be invited.

The new Architect to the L.C.C. has been appointed in the person of Mr. W. E. Riley, at a salary of £2000 a year. Mr. Riley is at present assistant architect to the Admiralty, and has built hospitals, barracks, coast-guard stations and offices. He has also superintended large building and engineering works at several Mediterranean stations.

New Type of Tramway Car.—A new style of electric tramway car is being built from a design by Mr. A. L. C. Fell, electrical

engineer, for the Corporation of Sheffield; it is a single deck smokers' car and is divided into three parts, a centre compartment, and a platform at each end. The centre compartment will accommodate fourteen non-smoking passengers, and each platform has room for eight smokers. Seats are provided on each platform for four smokers, and there is standing room for four more. Another special smokers' car, also designed by Mr. Fell, is being built, and gives accommodation for the same number of passengers, smokers and non-smokers, but the smokers' platforms are closed in with windows at the sides, which can be raised. All the cars will be illuminated by electric light. These cars are being built so that the Tramways Committee can decide whether they will prove suitable for the purpose required.

A Defective Building.—An inquiry was held last week at Aberdeen into the circumstances attending the death of John Farqu-

## MORRISON & INGRAM'S Hospital Sanitary Appliances.

NUMEROUS NEW AND IMPROVED DESIGNS IN SINKS, LAVATORIES, BATHS, AND CLOSETS.

CATALOGUES ON APPLICATION.

NEW PATENT BEDPAN AND URINAL WASHING APPARATUS, AND PEDESTAL FLUSHING RIM SLOP HOPPER.

This system of washing bedpans, &c., is very simple, cleanly, and inoffensive. In the act of washing, the hands need not touch the pan, it is only necessary to turn round the swivel arm to see that pan is perfectly clean before lifting it off spray hook.

harson, an apprentice mason in the employment of Messrs. Beattie and Beaton, builders, of St. Peter Street, Aberdeen, who was killed on February 10th by the fall of the gable of a house in course of erection in Ann Street. Mr. W. Ross, carpenter, proprietor of the house, said the building had a Mausard roof. At the time of the accident the south gable had been completed. The plans were prepared by Mr. Duncan Hodge, and witness himself inspected the work. Two days previous to the accident rain fell in torrents, and he did not think now it was wise for the men to have gone on with the work on the day following. Eight feet of the gable, the tympanum, and part of the wall had fallen, carrying with them the joists, and three men were injured. The deceased was found at a quarter-past two. Witness was satisfied with the workmanship, except for the substitution of bricks here and there where the specification provided for stones. In answer to the builder's solicitor, witness said that there was a scarcity of stones, and he approved of the use of bricks. Mr. John Rust, city architect, stated that he had examined the building after the accident. The gable wall was badly constructed through the mutual boundary wall being allowed to remain, and the gable wall of the house being built on the slope following the batter of the dyke. The gable wall was not built of proper material; instead of granite through bands and stanchions at the sides of piers and fireplaces brick had been used, with no attachment to the back part of the wall. At the level of the ceiling of the attic floor a large wooden beam had been placed across the centre void, and a 9in. relieving arch thrown over it, with the chimney head built on the top of it. The abutments at the side of this arch being built of brick, the pinions were quite unable to sustain the thrust of the arch, and consequently when the scaffolding was removed the top part of the gable collapsed, and in falling brought down part of the front and back walls with it. The gable, irrespective of this, was

very roughly built. The lime mortar used was weak; the sand had not been riddled, and was of poor quality, and the proportion of lime was defective. The brick stanchions were a danger in themselves, and should not have been there, especially in an outside gable. There was a lot of small stones which should not have been in the sand. "Dooking," witness said, should not be done before the roof was on. The jury returned a formal verdict, adding as a rider that they considered the design and building of the gable defective, and that the wall was weakened by the "dooking" being done too soon.

**Fire Tests with Floors.**—The first official report of the British Fire Prevention Committee has just been issued, and deals with a test on a floor manufactured by the Expanded Metal Company, Limited. The object of test was to record the effect of a smouldering fire of fifteen minutes duration, at a temperature not exceeding 600deg. F., followed by a fierce fire for one hour, gradually increasing to a temperature of 2000deg. F., followed suddenly by the application for three minutes of a stream of water. The area of the floor was 100ft. (10ft. x 10ft.), and was loaded with 140lbs. of pig-iron per square foot. The time allowed for its construction and drying was three winter months. The effect of the test on the floor was that the plaster ceiling below remained intact until water was applied. A slight deflection of the floor and ceiling was also observed, and the concrete of the floor was slightly and superficially cracked; the fire did not pass through the floor. The fuel used for the test was gas. Altogether the floor seems to have stood the test very well. This test is one of a series which the Fire Prevention Committee are carrying out at their testing station at Regent's Park. The methods employed at the station to ensure the scientific accuracy of the tests were fully described in a recent article in these columns.

COMING EVENTS.

Wednesday, March 29

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers).—Demonstration of Book-keeping as carried out in a sanitary inspector's office by Mr. Albert Taylor. 8 p.m.

# CARBOLINEUM AVENARIUS

(REGISTERED).

## PATENT WOOD PRESERVATIVE.

**CARBOLINEUM AVENARIUS**, the well-known Wood Preservative, enters the wood by its own action, and does not require a costly plant and machinery like other Wood Preservatives.

**CARBOLINEUM AVENARIUS** entirely prevents dampness in brick and stone walls, also wet and dry rot in timber above or below ground, and is used by all the leading Railway Companies, and by Builders, Brewers, Contractors, Estate Agents, Mine Owners, &c., &c., in the United Kingdom.

**CARBOLINEUM AVENARIUS**, the most successful preservative and antiseptic for Wood Paving Blocks. Used in the Metropolis and many Provincial Towns. Superior to Creosote or Hard Wood.

For further Particulars and Testimonials, apply

**PETERS, BARTSCH & CO., DERBY, and 68, Queen St, Cheapside, London.**

## To All Owners and Users of Steam Boilers.

PATENT 22,561, ACCEPTED FEBRUARY 9TH, 1895.

### ABSOLUTE PREVENTION OF BOILER INCRUSTATION.

By addition of Chrome Salts to the Feed Water the formation or deposit of all Incrustation is thoroughly prevented.

For Cost of Licenses and Full Particulars, apply

**PETERS, BARTSCH & CO., DERBY, and 68, Queen Street, London.**

## INDESTRUCTIBLE COMBINATION WASHERS,

FOR FLANGE JOINTS OF STEAM AND WATER PIPES.

Tested up to 2300lb. Pressure

These Washers consist of Rings of Soft Metal, grooved outside, and holding in the groove packing material such as Asbestos, Rubber, Hemp, &c., &c. The soft metal, in conjunction with the packing included, will accommodate itself readily to any unevenness in unplanned flanges, and make a perfect and durable joint. It is impossible, owing to their construction, to blow them out under any pressure whatever.

**PETERS, BARTSCH & CO., DERBY**

London Office: 68, QUEEN STREET, CHEAPSIDE, E.C.

## METHODS USED IN PRODUCING TERRA-COTTA MOULDINGS.

By WILLIAM REID.

(Concluded from page li.)

The opposite side is next covered and finished in the same way, then the two ends. These four pieces complete the "slips" or sides of the mould, and only the face is required to complete the work. Before doing this, however, there are one or two points to be observed in the pieces already made. First there is the way in which the edges of each piece is finished off. This is not very clearly shown on the drawings, and an enlarged view of the corners is given at Fig. 7. By making them like this they fit more firmly together than if cut square. Then, along the outer edge small notches have been cut. These, when the top face is cast, constitute joggles, which further tend to keep each part securely in its place. It may be noticed, further, that the "slips" or sides have not been trimmed up square or perfectly perpendicular to the face of the bench, but are tapering slightly outwards. The reason of this will be apparent when the mould has been completed. To cast the remaining part, or top face of the model, clay is built up and round the sides as shown at Fig. 8. The portion exposed is then covered with plaster.

requisite polish and smoothness is the work of the finisher.

This finishing is not, however, done as soon as the clay is taken from the mould, but some hours afterwards—perhaps the following day—when the block has had time to dry and become sufficiently stiff to handle freely. The tools required by the finisher are varied in the extreme and usually of his own manufacture, or got from a fellow workman. The majority are made from pieces of boxwood fashioned to the different shapes of angles, curves, beads, or what-not that he may have to finish. A most useful tool is a piece of leather which serves the purpose of smoothing over large curved surfaces. Flat surfaces are finished with a knife.

All this finishing requires considerable skill and taste on the part of the finisher, particularly when he has to deal with elaborate enrichment. A drawing is given (Fig. 12) of the finished clay block principally with the object of showing the manner of treating the ends. These will be seen to be slightly panelled with a hole cut in the middle. The paneling is done, not only with the intention of allowing more mortar to be placed between each block when built without showing a needlessly wide joint, but also, in case this particular piece does not fit properly, it becomes a much easier matter for the mason to chip away the objectionable parts. The hole serves two purposes, first, it is a convenient

## Trade and Craft.

### ART METAL WORK.

We have received a most comprehensive catalogue of some of the art metal work, &c., supplied by Mr. T. J. Gawthorp, of 16, Long Acre, W.C., and 19, Castle Street East, W. Section 1 comprises memorial brasses; section 2, naval and military memorial brasses; section 3, ecclesiastical art brass and ironwork; section 4, wrought-iron work; and section 5, memorials. The firm makes a speciality of "Latten" brass, which they claim to be the same as the ancient metal. The firm also supplies mounts for the brasses. The catalogue is not intended for use as a stock-pattern book, but illustrates what work has been actually done. The firm will carry out architects' designs with accuracy and with due consideration of the correct proportions of metal needful for weight and strength without detriment to beauty of design. The designs in the catalogue give one a good idea of the effect of the articles when finished.

### AN ADVERTISING SHOP BLIND.

Messrs. Janes and Son, general window-blind contractors, of 101, Aldersgate Street, E.C., are supplying a patent outside Shop Blind, the novelty of which lies in the appli-

FIGS. 7, 8, AND 9. STAGES OF PLASTER MOULD. FIG. 10. MOULD FITTED WITH CLAY. FIG. 11. SECTION OF MOULD. FIG. 12. FINISHED CLAY BLOCK, SHOWING PANELLED SIDES.

The finished mould will appear like Fig. 9, which shows the utility of the part last made in serving the double purpose of a mould for the face of a moulding, and a case to keep the four sides securely in their places.

Another drawing (Fig. 10) shows the complete mould resting on the case and filled with clay. If a section were cut through the middle of the mould, it would present an appearance like Fig. 11, where the benefit of slightly tapering the sides, will be understood since by this means the case may be easily slipped off. The next operation is to fill the mould with clay. On each presser's bench a heap of clay is built up. With a piece of wire a slice is cut from this heap, caught up and placed against the inside of the mould, the presser beating it with his hand and pressing it into every marking of the mould. This he does till the sides of the mould are all covered, the centre being of course, quite hollow. Before the mould may be removed from the clay-pressing some time may elapse, as the clay is at first inclined to stick to the sides of the mould. The porous nature of Plaster of Paris is, however, particularly adapted for work of this class, for in a short time it will have absorbed a certain amount of moisture from the clay, which then slightly shrinks and renders the removal of the mould an easy matter. This is done by turning the mould over on to a board so that the case is uppermost. The case is first removed, then the sides. The clay pressing does not, as a general rule, present a sufficiently fine surface when taken from the mould, and to put on the

handle by which the block may be lifted, and, next, it is absolutely necessary, when the block is set in the kiln, as a vent by which the steam may escape. However dry the clay may seem before being taken to the kiln it is astonishing the amount of steam that becomes disengaged when firing is commenced and, as the block is set in the kiln in the same position as shown at Fig. 12, it will be readily seen that, unless some escape be provided for this, the steam would simply rack and crack the whole work.

One other noteworthy point, in the matter of blocks cracking, is the way in which they are set out in the drying shed after being finished. The shed may be heated by overhead pipes or pipes laid under the floor but, in any case, each block is set on a board over which a piece of paper has been laid. This may not be so very necessary in the case of small pieces but, when the mass of clay is at all heavy, it is very apt, being damp, to stick to the board, thus interfering with its proper shrinking. As the clay dries it shrinks and creeps along the face of the board. The interposition of a piece of paper allows it to do this freely and obviates the likelihood of cracking.

**A Plan of London.**—The Corporate Property Committee of the London County Council has prepared a report on the ground plan of London, on which they have been engaged for about five years. It aims at supplying a complete system of land registration, and has been found to be of very great use to the Council.

cation of an entirely new system of the projected ironwork together with the raising of the front laths for advertising purposes. The patent arrangement is attached to the front lath of the blind, and can be easily turned up and fixed to face the street, and rolling up with the blind protects the material from dirt and damp. The side brackets do away with the old plan of sliding irons, and can be curved to obtain an altitude of 10ft. in the highest part, and 7ft. 6in. in front. The address of the firm is 101, Aldersgate Street, City, E.C.

### CLARIFONT LAVATORIES.

These lavatories are specially notable for an arrangement to obviate the accumulation of soap and dirt, which collects in the water of an ordinary wash-basin during washing, and they are also meant to prevent the soapy scum from adhering to the sides of the basin when emptying. The Clarifont Lavatory provides an inner basin with a constant supply welling up from the bottom all round the rim and overflowing during the washing, thus carrying off at once the soiled and soapy water. The inner basin is made small in order that the water in it may be kept clean by being changed quickly. The system is applied in various forms and sizes to two distinct classes of lavatories, to those with taps, where the water supply is under personal control, and to simultaneous ranges. The lavatories are supplied by Wm. Cassels, the patentee and manufacturer, Kirkintilloch, near Glasgow.

## A MODEL FILTRATION SCHEME.

A NEW aeration and filtration scheme, which presents certain interesting features, has just been completed in connection with the Hornsea Waterworks, East Yorks. The new extension provides for the water from the existing shaft, which is a little over 70ft. deep, being lifted by the present pump; the water being then carried through an 8in. pipe, and delivered through a perforated spreader, which stands 22ft. from the ground. Through this spreader, which is made of copper and somewhat resembles in appearance a huge holder for flowers, the water is sprayed on perforated ledges of the aeration table. The ledges being pierced with holes break up the water, and a high wall is erected round the spreader to prevent the water from splashing out. From the aeration table the water flows down the weir, which consists of a succession of glazed brick steps, and enters the settling tanks.

Provision is made for the conveyance of the water direct from the air chamber to the settling tanks, when the weather is too severe to admit of the aeration table and the weir being brought into use. After the water has been well oxidised by the aeration, any sediment is precipitated to the bottom of the settling tanks. There are two settling tanks, each of which will have a capacity of 10,000 gallons, and can be used separately if desired. Each is fitted with two large floating valves, which will convey the water from the level at which it is clearest. The water is then conveyed through iron pipes along the bottom of the filtering chambers, through bell-mouthed pipes, into circular sumps in the centre of these chambers; from these sumps it is distributed on to the sand or gravel which forms the filtering material. After the water has filtered down to the bottom of these chambers it is conveyed along several sanitary pipes, and then through the distributing main of the reservoir.

The three filtering chambers will each have a superficial area of 720 square feet; each chamber is 36ft. in length, 20ft. wide, and 4ft. deep; gun-metal faced valves are placed to each sump, filter, and settling tank, so that any part of the plant can be cut off for repairs or cleaning out. The reservoir is 135ft. long and 51ft. wide over all. It is divided into two compartments each having a carrying capacity of 200,000 gallons. The construction is on the retaining wall system, and it is puddled on the outside with 12in. of tempered clay. The reservoir is provided throughout with sumps, valves, and manholes. The whole of the reservoir, settling tanks, and aeration buildings are constructed of Portland cement concrete and faced up in cement. There are proper inclines introduced into all the chambers, and the water is pumped out of the reservoir by a simplex positive action feed pump, which will be fed by steam from the present boiler. This pump forces the water into the main under pressure, and also delivers it to the storage tank at the top of the existing tower; there will therefore be the option of a supply of water by either or both of these systems, including the means of gravitation as it is now employed. These systems will permit a constant supply of water to the town and allow for any contingencies that may arise from breakdowns. The extra force of water will be of great service to the local authorities in the flushing of the drains.

The erection of this plant will almost entirely occupy the area of about an acre adjoining the tower, which is the property of the Council. The aeration and settling tanks are erected on the south side of the tower and the reservoir is on the eastern boundary. The scheme is a model one, and has involved an infinite amount of work and technical knowledge in its preparation. It was designed by Mr. P. Gaskell, C.E., surveyor to the Urban District Council, and the whole of the work was carried out under his supervision.

## THE PLASTERERS' DISPUTE.

THIS dispute is being carried on in a very dilatory fashion, and there is not much to report since our last issue. The officials of the Master Builders' Association seem to think that the results so far achieved are satisfactory, and they are confident that in a very short time all the important firms in London and the country will fall into line with them in the action they are taking. On the other hand, the officials of the Plasterers' Union state that although there has been a considerable increase in the number of men locked out, this has been counterbalanced by those who have found employment with non-federated masters. On March 24th it was ascertained, by inquiry at the offices of the Union, that 2240 men signed the strike pay-sheets last week, or ninety-four less than the previous week. Many of these men only receive one day's pay, as they have been unsuccessful in finding employment with non-federated masters. The special levy of 3s. per member per week has resulted in close upon £1000 being received at the head offices.

Mr. Deller wrote to Mr. Hassall on the 24th inst., stating that his Council were still willing to meet the members of the Masters' Association in conference, and that if the employers had agreed to this course when first suggested by the Union, much might have been cleared up.

The Earl of Wemyss in a letter to the "Times," says that when he was asked the other day, he supposed on account of his connection with the Employers' Parliamentary Council, if he had anything to do with the plasterers' lock-out, he answered no, and added that his impression was that by the time the strike ends employers will have found that they can do without skilled artistic plasterers. Ceilings, instead of being plastered, will be made of canvas, painted and decorated, and of wood panelling. There will also be carved gilt painted wood cornices, and possibly the Italian ceiling will come into fashion, which shows the joists on which the floor of the story or rooms above rests.

In the provinces matters are somewhat briske. At a men's mass meeting in Leeds, last week, it was suggested that the locked-out men should establish a big workshop of their own in Leeds, and the proposition was unanimously carried. The whole tone of the meeting showed resolute resistance. The directors of the Leeds Co-operative Association fully approve of the steps taken by the men to establish a business on their own account, and have promised pecuniary support.

It is stated that at Blackburn a curious development in connection with the lock-out has come to light, and one by which the masters bid fair to score. Contrary to the custom in London, the master-builders of the northern towns do not employ working plasterers direct, but contract with master-plasterers. The master-plasterers of Blackburn belong to the men's Union, and the master-builders are federated now. The former have issued seven days' notices to their men in consequence of the pressure brought to bear upon them. This means that the master-plasterers will have to withdraw from the Union, go back upon all their previous professions, and, if they continue to work, employ non-union men.

An advertisement has been published in a Rotterdam newspaper offering plasterers 10d. per hour, cert. in employment for at least two months, and free passage to London. The agents of the London employers were at the Hotel Coomand on Sunday, last week, to give more particulars. The Rotterdam branch of the Dutch Plasterers' Trade Union, were apprised of the matter, and a meeting was held to consider the position. The causes of the dispute were discussed, and a resolution was unanimously adopted, in which the Rotterdam plasterers declared their intention to assist their English brethren in the dispute, and to raise funds for their support.

## Surveying and Sanitary Notes.

**Improvements at Preston.**—It is proposed to borrow £40,000 to £50,000 for the purpose of improving some of the principal thoroughfares in Preston.

**The Widening of Key Street, Ipswich,** will cost £500. The Corporation will grant the sum of £700 for the right of way which it will acquire, and to defray the cost of the work.

**Blackpool Promenade.**—The Blackpool Corporation are promoting a Bill this session for the widening of the promenade 60ft. seawards, and for the construction of a double line of tramways on the front, at a cost of £350,000.

**Plans for a new Slaughter House** for Aberdeen by Mr. John Rust, architect, have been adopted by the Flesher Incorporation of Aberdeen. These provide for pretty extended buildings, and the total cost of the scheme is £17,000. A portion is to be proceeded with at once, which is estimated at £4000.

**Calder Valley Sewerage Schemes.**—The local authorities of Luddendenfoot, Warley, Midgley, and Mytholmroyd have long had under consideration a joint sewage disposal works scheme, and Mr. F. H. Tullock, an inspector of the Local Government Board, is to hold an inquiry into the necessities of each district.

**Lady Sanitary Inspectors.**—A lady sanitary inspector was appointed some months ago by the Vestry of St. George-the-Martyr, Southwark. Much interest was evinced in the experiment, and it is now intended to appoint another lady inspector, whose duties will more particularly include the inspection of workshops in the parish. The salary of the new officer will be £110, rising by annual increments of £10 to £150 per annum.

**Compensation for Sanitary Works.**—A question of considerable interest was decided by the Court of Appeal in the case of Davis v. Witney Urban District Council on March 15th. The plaintiff, Mrs. Ellis Davis, on receiving notice from the District Council that a sewer would be laid through her fields gave notice that she claimed £300 compensation. On the assumption that the work would be executed the matter went to arbitration, and an award was made. But before the award had been made the council abandoned their scheme. The award directed the council to pay £10 for compensation, and also to pay the cost of the arbitration and plaintiff's costs. The question raised was whether, as the work had never been begun and had been abandoned, the award was bad in law. Justices Ridley and Channel, while agreeing that the award was not good, differed on the question of plaintiff's power to recover costs. Lords Justices A. L. Smith, Collins, and Romer dismissed the plaintiff's appeal. They held that the award was invalid for the reason above stated, and that as the £10 awarded could not be recovered, so the part of the award dealing with costs must go by the board also; but Lord Justice Romer added that another part of the Act (the Public Health Act of 1875) gave the landowner power to go to arbitration and get compensation if he could show that damage had ensued by reason of the receipt of the notice of intended works. The plaintiff accordingly was not even now shut out from moving for compensation, and he hoped the District Council would meet the plaintiff, and not force her to incur further expense.—The other Lords Justices concurred in these remarks.

**The buildings in front of the Hotel Cecil** will soon be completely demolished, in order that the erection of the front of the hotel may be finished.

## Builders' Notes.

**The Smoke Nuisance.**—In the Chancery Division of the High Court of Justice, before Mr. Justice North, last Wednesday, the Queen Anne Residential Mansions and Hotel Company brought forward a motion to restrain the New Niagara Company Limited from continuing an illegal nuisance by the emission of smoke and noxious malodorous vapour, said to be emitted from the defendants' premises and produced in the manufacture of artificial ice. The defendant company asserted that, though ice had been manufactured on their premises for several winter seasons, no complaint was made till 1898, when there was a temporary difficulty in getting steam coal; that if there was any great nuisance, it was produced by engines on the underground railway, an incandescent mantel manufactory, and causes other than their works. It was contended also on their behalf that the plaintiff company could only suffer pecuniary loss; they could have no personal inconvenience, and no occupiers were suing, therefore no interlocutory injunction could be granted. It was in evidence that the defendants had requested to be allowed to take a room, to test whether there was any emission in fact, but the plaintiffs had replied to the effect that they had no vacant room. This was used as an argument that the tenants could have suffered little inconvenience. Mr. Justice North considered it was not a case in which he ought to interfere by interlocutory injunction, and refused the motion.

**Dundee Improvements.**—The Dundee Municipality has at present many things in hand concerning the improvement of Dundee. It is contemplated to construct an outlet for the existing esplanade by the formation of a roadway along the south side of the Caledonian Railway, by bridging the railway and by laying out new streets through the grounds of Balgay to Perth Road. In addition there is under consideration a proposed extension of the sea wall westward in a straight line, with a view in the meantime of inclosing about 60 acres of open space. The scheme is estimated to cost £20,000. The Municipality intend in June to take over the tramways, and to extend them to other parts of the city. The purchase will involve an expenditure of about £50,000, while the equipment of the lines and the erection or reconstruction of the necessary lower station—electricity having been fixed upon as the mode of traction—will require an extra £60,000. Further expenditure will be incurred in widening some of the streets to be traversed by the new systems. The probable cost of this department is stated at £26,000. Additions are to be made to the King's Cross Hospital, and the cost will be about £14,000. It has been resolved by the Town Council to build a central fire station, and a site for the building has been obtained in West Bell Street. The sites for nine underground lavatories have been selected, and are estimated to cost £3500. The Central Public Baths are to have a new porcelain swimming bath, several private baths, and one or two recreation and reading rooms. These are expected to absorb about £6000. At the Cattle Market three extra stalls for the use of meat salesmen are to be run up, at a cost of about £300.

**Claim for Extra Work.**—Before Mr. Justice Mathew in the Queen's Bench Division on March 17th, Messrs. Mowlem and Co., contractors and builders, sued the Army and Navy Auxiliary Supply (Limited), to recover £720 for extra work done in connection with a building contract. Defendants denied liability, and counter-claimed for penalties. Mr. Harrison, for the plaintiffs, said his clients entered into a contract for £25,800 for the erection of a large building, which was an addition to the existing buildings of the defendants. The contract, which was dated June 10th, 1895, limited the time within which the work was to be completed. During the execution of the work possession was not

given to the plaintiffs of the various parts of the existing buildings for the purpose of executing the new work, and large additions were made after the time limited for the performance of the contract. The plaintiffs, therefore, said that, having by the direct action of the defendants been prevented from completing within the specified time, the latter were not entitled to recover penalties. The defendants, on the other hand, said they were entitled to deduct from the amount due to the plaintiffs £720, being penalties at the rate of £10 a day for each day beyond the period specified for the completion of the contract, and it was this amount which was in dispute between the parties. Mr. J. Walton, for the defendants, interposing, said the case could only be tried by going into great detail, and it would be much better to try it before the Official Referee, Mr. Pollock, than attempt to deal with it in Court. The case was accordingly referred to Mr. Pollock, the Official Referee.

**Phoenix Fire-proof Plates.**—These plates which have been used extensively for public buildings in Holland, are about to be introduced into this country, and with the object of showing their value, a test was carried out last Wednesday at Willesden before a company of experts. The qualities claimed for the plates are various. By their use any building may be rendered fire-proof at a comparatively small cost. The material much resembles ordinary plaster, and is made up in slabs of varying thickness, which can be fixed by simply nailing and cementing the joints. It is equally adaptable to ceilings, floors or walls, besides lending itself for use in moulded and panel-work. It is inexpensive, simple in composition, and light in bulk, the plates having about the same specific gravity as hardwood. For the test a two-storied structure was built, two lower rooms being constructed with fire-proof plates, the room on the upper storey being entirely of wood. A fierce fire of dry wood and tar was kept ablaze for twenty minutes in one of the lower rooms without materially damaging the walls, or to any extent increasing the temperature of the adjoining room, the walls of which were cool to the touch. Although between the room above and the fire there were only the wooden joists and one-inch plates, no damage was done to the upper portion; neither did the water seem in any way to affect the material when pumped on to the walls while at their greatest heat. The material was shown to be an admirable non-conductor, for even the ordinary nails with which the plates were fixed to the woodwork were in no way affected by the great heat. As to whether this would be so had been a matter of speculation. We may expect soon to see the plates on the market, owing to the simple conditions under which the material can be produced. The conditions of the test were suggested by Mr. R. Philip Day, A.R.I.B.A., and the test was carried out by Messrs. Fry, Everitt and Company, of 55, Suffolk House, Laurence Pountney Hill, E.C.

**A Carter's Claim.**—At the Nottingham and Notts Assizes, before Mr. Justice Bucknill, Frederick Shepherd, carter, of Charlton, claimed from Messrs. Fish and Son, building contractors, the sum of £58 4s. 7d. for cartage work done on their behalf. Mr. Fox, for the plaintiff, stated that the point in dispute was as to whether the work, which was done in connection with excavations at the Saxondale Asylum, was to be paid for according to time, or whether the plaintiff was to have 8d. per cubic yard. The defendants were contractors for part of the work at the asylum, and they had a sub-contractor who threw up the work and left. Plaintiff was employed to carry on the work, but had never done work of this description before, and declared that he had distinctly refused to give a price, his reason being that the previous sub-contractor had done the easiest part of the work. Evidence, defendant stated, could be brought forward to show that 8d. per cubic yard was a fair price. The defendants had set up a counter claim for £7 7s. 9d., alleging that they had paid the plaintiff that amount more than he was

entitled to. The plaintiff, examined by counsel, stated that he was employed by Mr. Palin, the sub-contractor, to provide him with horses and carts for the Asylum contract. Palin's terms were a shilling per hour for the horses and carts. When the sub-contractor left he did not pay him. Plaintiff then offered to go on with the work if defendants would pay him a shilling per hour. They refused to do this, but he was instructed to get on with the work. In accordance with defendant's desire plaintiff set more horses and carts to work. When plaintiff asked for £80, one of the defendants told him that he did not intend to pay it, saying that he had overdrawn, and would only be paid 8d. per hour. Defendants ultimately advanced £30 to pay the men. Plaintiff emphatically denied having agreed to carry on the work at 8d. per yard. The plaintiff's foreman deposed that he was present when the plaintiff arranged to undertake the work, and nothing was said about the price. Mr. F. Fish, one of the defendants, stated that they had employed Palin, the sub-contractor, to do excavations for them on the site of the new Post Office. The price paid was 11d. per hour. Defendants afterwards contracted with Palin to do the work at Saxondale. Subsequently, said the defendant, Shepherd took the work over, and agreed to accept 8d. per yard for doing the remainder of the job. The work was satisfactorily measured up in the presence of the plaintiff. On Aug. 27th the defendant stated that he paid the plaintiff £50 on account, and on Sept. 1st the work was measured up again, with the result that they found the defendant had been paid quite sufficient already. Defendant also stated that he had let plaintiff have £30 on the understanding that he did not move any portion of his plant. Mr. T. Fish corroborated these statements. Thomas Chester, foreman of the works, stated that in conversation with the plaintiff the latter told him that he was getting 8d. per yard. He never suggested at any time that he was doing day work. The jury returned a verdict for the plaintiff for the amount claimed.

## Masters and Men.

**Kirkcaldy Joiners** have gained their demand for  $\frac{1}{2}$ d. per hour advance.

**Grimsby Joiners and Carpenters** ask for an increase in wages of from  $\frac{7}{8}$ d. to 8d. per hour minimum.

**Painters at Galashiels and Newtown** have received a rise from  $\frac{7}{8}$ d. to 8d. per hour in their wages.

**Sunderland bricklayers' and masons' labourers** have applied for an advance in wages of  $\frac{1}{2}$ d. per hour.

**Peterhead Ship-Carpenters** have struck for an advance of wages, these being fixed at 6d. per hour for new work and  $6\frac{1}{2}$ d. for old work.

**Hull Joiners** have struck for  $\frac{1}{2}$ d. an hour increase. They charge their employers with unfairness, and say that they agreed to receive a deputation of the men and then declined to meet them. It is reported that about 500 joiners are affected by the strike.

**Engineers' Wages.**—Replying to an application made by the Amalgamated Society of Engineers on the North-East Coast for an advance in wages, the employers have intimated that they are unable to grant the request, owing to the increased price of material, and for other reasons.

**Arbroath Painters** have applied to the local branch of the Master Painters' Association for an increase of wages at the rate of  $\frac{1}{2}$ d. per hour. It was unanimously resolved by the association to refuse the advance. It has been agreed, however, to invite the employees to a conference.

Engineering Notes.

**The Featherstone Board Schools, Yorkshire,** are to be ventilated by "Cousland's Improved Climax" Patent Direct-acting Turret Ventilators: Design "F," supplied by the "Climax" Ventilating and Heating Co., Ltd., of Glasgow.

**The Technical College and Public Hall, West Hartlepool,** has been fitted with the latest improved hot water heating apparatus by John King Limited, engineers, Benson Street, Liverpool, employing their new "Rajah" ventilating radiators.

**Electric Supply at Manchester.**—Sanction has been given by the Board of Trade to the proposal made by the electricity committee of the Manchester Corporation to supply electrical energy to the districts of Levenshulme, Moss Side, and Withington, on the extra high pressure system.

**Leeds Gasworks.**—The Leeds Gas Committee resolved, at a meeting on March 22nd, to apply to the Local Government Board for power to borrow £150,000 for improvements in the gasworks undertaking. About £100,000 of this sum is wanted for the extensions that are to be made in the gas mains during the next five years.

**The Soudan Railway.**—It is stated that a gang of men from the Pencoyd Ironworks at Philadelphia will leave shortly for the Soudan to erect the bridge which is to carry the Soudan Railway across the Atbara. The seven spans of the bridge, 1100ft. in length, have already been shipped, though the order was given less than six weeks ago.

**New Electrical Station for Greenock.**—At a meeting of the Greenock Electrical Lighting Committee of the Police Board, the following contracts for the erection of an electrical station in Hunter Place were accepted: Builders, Mr. J. M'Ewan, of Dellingburn Street, Greenock; electrical main fitters, the Callanders Co., of London; engine-house plant fitters, the Silverton Co., of London; boiler

makers, Babcock and Wilcox, of Glasgow. The aggregate amount of these estimates is over £30,000.

**Liverpool to Manchester in Eighteen Minutes.**—A sub-committee has been formed of the following gentlemen to inquire into the engineering and commercial feasibility of Mr. Behr's scheme and to report: Manchester representatives: Sir W. H. Bailey, Mr. Edwin Guthrie, Mr. L. Levinstein, Mr. William Mather, Mr. Reuben Spencer, and Alderman Higginbottom. Liverpool representatives: Mr. Danson Cunningham, Mr. Alfred L. Jones, Mr. C. Petrie, Mr. S. B. Cottrell, Mr. A. B. Holmes, and Mr. J. I. Wood.

**Heating and Ventilation in Schools.**—Messrs. Matthews and Yates, Ltd., of Swinton, Lancashire, have just been successful in obtaining the contract for heating and ventilating the Great York Schools, Hanley, Staffordshire, also the Cross Street Schools, Stoke, for both of which Messrs. Scrivener and Son, of Hanley, are the architects. At Hanley, the "Plenum System" has been adopted, a large Cyclone air propeller being used for the fresh air supply, in conjunction with heaters for each room. The vitiated air is extracted by means of Cyclone electric fans placed at convenient points in the roof. At Stoke, direct radiation is the system to be used by means of radiators, fresh air being supplied through them, becoming heated in its inward passage, and the vitiated air is extracted, as at Hanley, by electric pans.

**New Thames Tunnel.**—A scheme was submitted at last week's meeting of the London County Council for the construction of a second roadway tunnel under the Thames, eastward of the Tower Bridge. The scheme has been drawn up by the Bridges Committee, and it is intended that the tunnel shall run between Shadwell and Rotherhithe. The total length of the proposed tunnel and approaches, from Union Road on the south to Commercial Road East on the north, will be about 1½ miles. The width of the thoroughfares proposed in the Rotherhithe Tunnel is 17ft. for the carriage-way and 4ft. 2in. for each footway. The approximate estimate of the total cost of the scheme is £2,198,250. Of this £798,250 is for the acquisition of the

necessary property, but this sum also includes the cost of acquiring sites for the rehousing of those persons of the working classes who may be displaced by carrying out the scheme. As to the engineering work, it is proposed to carry it out in precisely the same way as at Blackwall. The excavators will work in compressed air. The tunnel will be of iron with a backing of concrete, and will be lined with white bricks. The consideration of the matter was adjourned.

**Engines for Electric Railway Traction.**—Messrs. Cole, Marchent and Morley, of Bradford, have just completed the first of two pairs of horizontal compound Corliss engines for the City and South London Railway, which is now approaching completion, and will probably be opened for traffic about June or July next. Each pair of engines is of about 1200 indicated horse power, and is designed to run directly coupled to the dynamo, the crank shaft of the engine and the armature shaft of the dynamo being in one. The general design of the engines is not unlike that of a very short, stiffly built, high-pressure horizontal steam engine, the only difference between the two being that the low-pressure engine has a much larger cylinder. The engines are to be placed side by side, with just sufficient room between them for the flywheel and the dynamo. The diameter of the high-pressure cylinder is 24in., and of the low-pressure cylinder 48in., the stroke being only 48in. The speed is eighty-five revolutions per minute. The Corliss valve gear is of the ordinary type, with vacuum dash-pots instead of springs. The flywheel is built up of dished steel plates bolted to a heavy cast-iron hub and having a heavy cast-iron rim. All the cranks and eccentrics are encased so as to prevent the possibility of oil being thrown on to the dynamo, and this closing-in of the engine renders it possible to keep a constant stream of oil running through all the bearings. The engines are designed to work with a boiler pressure of 160lb. per square inch. The governing apparatus acts upon both high and low pressure cylinders simultaneously, and in addition to the main governor there is an auxiliary governor designed to pull the engine up entirely in the event of a short circuit tending to cause the engines to run away. The weight of each pair of engines is about 120 tons.

## Auctions for the Year 1899.

**MESSRS. TROLLOPE'S SALES OF FREE-HOLD AND LEASEHOLD ESTATES, HOUSES, GROUND-RENTS, &c.**, will take place at the Mart, E.C., as follows:—

Thursday, April 20th	Thursday, August 3rd
Thursday, May 18th	Thursday, October 19th
Thursday, June 8th	Thursday, November 23rd
Thursday, July 13th	Thursday, December 14th

Sales will be held on other dates as required. In all cases Messrs. Trollope will be glad to have as long notice as possible respecting any property they may be instructed to offer by auction.

## Forthcoming Sales for the Year 1899.

**MESSRS. E. and H. LUMLEY (Lumleys,** of St. James's House, 22, St. James's-street, London, S.W.) beg to announce the following days of **SALE by AUCTION**, for the forthcoming year, at the Mart, Tokenhouse-yard, E.C.; but, in addition, other dates can be arranged for special sales. Terms on application.

Tuesday, April 25th	Tuesday, Aug. 15th
Tuesday, May 23rd	Tuesday, Sept. 12th
Tuesday, June 6th	Tuesday, Oct. 17th
Tuesday, June 20th	Tuesday, Nov. 14th
Tuesday, July 4th	Tuesday, Nov. 23rd
Tuesday, July 18th	Tuesday, Dec. 12th

Messrs. E. and H. Lumley announce in the advertisement columns of the "The Times" on Saturdays a complete list of their sales, which will include estates in England, Ireland, and Scotland, town and country properties, ground-rents, reversions, gas and water shares, stocks, &c. In cases where property is to be included ample notice should be given in order to insure due publicity.—St. James's-house, No. 22, St. James's-street, S.W.

## Dates of Sales for 1899.

**MESSRS. EDWIN FOX and BOUSFIELD** announce, for the convenience of their employers, that their **SALES by AUCTION OF LANDED and HOUSE PROPERTY**, Ground and Improved Rents, Reversions, Policies of Assurance, Shares, and other Securities, will take place during the year 1899, at the Auction Mart, Tokenhouse-yard, Bank of England, on the following Wednesdays in each month:—

April 12th	June 21st	October 18th
April 19th	June 23rd	October 25th
April 26th	July 5th	November 1st
May 3rd	July 12th	November 8th
May 10th	July 19th	November 15th
May 17th	July 26th	November 22nd
May 24th	August 2nd	November 29th
May 31st	September 20th	December 6th
June 7th	October 11th	December 13th
June 14th		

The prices realised at these auctions are not included in the official reports, such quotations being often injurious, and never beneficial, to the only parties concerned—buyer and seller.

No. 99, Gresham-street, London, E.C. Telephone 6. 118, Bank.

**EDWIN FOX and BOUSFIELD,**

At the Auction Mart,

On Wednesday, May 10th,

At Two o'clock, in one Lot.

**MILL-HILL, Hendon.**—Valuable **FREE-HOLD ESTATE**, well situated, opposite the Mill-hill Station, on the Great Northern Railway, with a capital service of trains to King's-cross, Moorgate-street, and Broad-street, and within eight miles by road of Regent-street. The property comprises nearly 40 acres of ornamentally timbered pasture land, with gentle, warm southern slope, almost entirely surrounded by parish roads, to which there is about a mile and a half of existing frontage, and great scope for

creating other leading thoroughfares. There is a substantial house known as Bittay Farm, with a capital range of outbuildings. The estate in its present form commands a rental of £300 a year, and is capable of development by judicious building operations, or the creation of freehold ground-rents. The land is exceedingly well circumstanced for the formation of through roads, and the creation of new frontages in addition to those it already possesses.

Particulars at the Mart; at Messrs. EDWIN FOX and BOUSFIELD's Office, 99, Gresham-street, Bank, E.C.; and of the

Vendors' Solicitors, Messrs.  
**SOAMES and THOMPSON,**  
12, Coleman-street, E.C.

**REAL Cheap Lots of small weekly SHOPS or HOUSES in London WANTED to PURCHASE.** Handsome commission paid to introducers. Agents' lists of real selected and inspected cheap lots carefully examined. Send full particulars to actual buyer.—Address, "A," at Horncastle's, Cheapside, E.C. 1

**SANITARY INSPECTORS' EXAMINATIONS.**—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E. 7

**ANSELL and MALLOWS, Architectural** Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C. 1

**R. I. B. A. EXAMS. PREPARATION,** personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum)

**R. I. B. A. SOCIETY OF ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS.** Preparation by correspondence, in residence, or personally.—MIDDLETON and CARDEN, 19, Craven-street, Strand, W.C.

**MASONS' CHISEL STEEL,**  $\frac{3}{4}$  in. to  $1\frac{1}{2}$  in. octagon, 14s. cwt. Masons' Chisels, assorted, 12s. 28lbs.—E. DEALEY, Moore-street, Sheffield. 2

## APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**WANTED, immediately, experienced** Assistant in Quantity Surveyor's Office.—Apply stating terms. John Watson, Cogan Chambers, Hull. 1

**ARCHITECT and SURVEYOR'S ASSISTANT WANTED, April 5th.** Must be a neat and careful draughtsman, accustomed to taking off quantities, accurate land surveyor and leveller, and one having had experience in town detail surveying. Permanency for a trustworthy man.—Applicants should give references and state age, experience, and salary to C. H. MARRIOTT and SON, West Park-street, Dewsbury. 1

## APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**YOUNG ARCHITECT, A.R.I.B.A.,** ASSISTS in the PREPARATION OF DRAWINGS, TRACINGS, &c., at his own Office. G. SCOREE, 23, Newman-street, W.

## An Architectural Causerie.

### The Complaint of the Student.

THERE is something in the nature of a plaint, which makes it peculiarly

offensive to the average prosperous Englishman. He does not pause to examine it from any unbiased standpoint, nor indeed does he deign to look into it at all, but with quite refreshing vigour and emphasis he condemns it utterly. There is absolutely no reason in his condemnation, that would be too great a demand upon his British intellect; for he dislikes equally a plaint with point in it, or a plaint without. I do not therefore expect the smallest sympathy from the "Powers that be," but I rely on our friends—the suffering students themselves—to support us through the coming trouble. Yet I am fully aware that the majority of students bear their sorrows with equanimity, and suffer in silence. The reason for this is that so many of them are themselves unaware of the viciousness of the system under which they work. Doubtless, if we searched, we might find a plentitude of extenuating circumstance, wherewith to defend the Department; to find these, however, is not my present purpose. I will describe my own personal experience at an institution of reputation which draws its yearly grants with becoming regularity. One of the subjects I was engaged in studying was "Design," a sufficiently comprehensive title, and enough to satisfy the most demanding of students. This was the manner of the class procedure: We gathered one evening a week, and in no way was that evening dull. Our examination of the subject was, to say the least, ambitious; we disdained no branch of design; no period of its history was without our ken, cursory enough, it is true, but little escaped our passing consideration. We had a truly admirable man as instructor, genuine and sincere, he was prepared to work with one and all in any way whatsoever, but as a teacher of design—well I would prefer to leave unexpressed my opinion. He slaved away at the hardly-used blackboard with unwearying arm; coloured chalks he used to heighten his effects, but the effect of all this on a student striving to gain an insight into the real principles of design must have been disastrous in the extreme. A word would lead him lightly from a discussion on Saracenic art, to one on Doulton's pottery. He would describe with equal enthusiasm—with a truth that I sometimes doubted—the principles of English art candlestick making, and the aim of the Dutch painters of the fifteenth century. The art of the Venetian glassworkers had as much interest for him, and consequently for us, as the most crudely mediocre of "sky signs." It would be no light work to give a list of the subjects we touched upon in that weird course of lectures. Tapestry, book-binding, enamelled iron signs, carving, wall-papers, and black and white work passed in a whirl before our astonished eyes. Even the composition of a picture came within our scope, and we saw ourselves by the light of his enthusiasm already leading stars in

artistic expression. But alas! We awoke, one and all, to find that our design was *nil*, and our knowledge from this course of lectures a minus quantity. In all probability the same thing is going on at this moment, instructor and students working for absolutely nothing; all their efforts ending in futility and confusion. Yet while this state of things was in progress, a representative of the Technical Education Board of the London County Council, a man I knew well by his excellent work and thorough knowledge, came in for a few minutes, and after standing modestly by the door, departed like a shadow, and the result of his visit was as if he had indeed been one. Of course it can be argued that even this system has brought forth its successful men and genuine Art workers, but I maintain that the result of their progress was in no way due to their work at such schools. In my personal experience I may be quoting an extreme case, yet it is apparent that the school's extremity of bad teaching has not endangered its grant, nor brought down criticism upon its hoary conservative head from outsiders, nor from the Technical Education Board. On my describing this to a friend,

touch for long-sweeping curves. He dilates on what "style" he considers the examiners will like, and what executive power is necessary to pass the test, but on the beauty of line or combination of lines he is silent. Of a truth he knows nothing of this, and so the essential principle is ignored, discarded as impossible to teach. I have known many who have followed the art schools for years to no purpose, except for a certain mechanical skill, but their artistic judgment was still uneducated and even uncouth. You could not trust their appreciation with certainty in any particular; they were uneducated artistically, and this as a result of years of South Kensington! The resulting tendency of genuine art teaching, should be an intense desire for original creative effort, or the formation of a true critical appreciation. This can be managed quite independently of historic art, although a discreet knowledge of it in its best examples should add materially to the creative outburst, as it most certainly would to the critical appreciation. Yet, granting it possible under the present conditions of art teaching that a desire for creative effort could be developed, we find here also the arrangement wholly inadequate. The

THE OLD BUILDING OF THE ROYAL UNITED SERVICE INSTITUTION IN PARLIAMENT STREET.  
(This building is now demolished, and its site is to be occupied by the new War Office.)

an upholder of the present pernicious system, I found his contention curiously illogical. He maintained that the particular evil of the class I had attended was in the attempt to cover the "whole ground," as he called it. "You cannot take every branch of design at once," said he, "but must, like an army corps, advance by sections." This is an ingenious theory, but a totally fallacious one, for the principle which underlines design will permit of no disintegration by "sections." The mistake which both the instructor and my friend made was in thinking that design could be taught by a knowledge of examples of historic design. But design is an art which is independent of its history, and is either gently instilled with infinite care, or is a purely natural growth. Another great reason for expressing a conviction as to the inadequacy of the art teaching in our schools is the essential detachment of subjects which is enforced and accepted as necessary and expedient. For instance, you may go to a school and take out of many sections or subjects the one, let us say, of second grade freehand drawing. The class is presided over by a master with a happy

strongest upholder of the present system could not maintain that they even do this, and here alone we have an indictment sufficiently severe, but it is not all. Granting the creative feeling is firmly established, no provision has been made in the smallest degree to supply a knowledge of the various mediums of Art workers in order to encourage its exercise. They will let you design for leather, wood, iron, silver, gold, glass, tapestry, or any other medium, but they will supply no knowledge of the nature of any of them. The teaching does not extend to practical demonstration; the line of demarcation is firmly drawn here, and except in the case of the easily accessible clay modelling and woodcarving class, there is no practical exercise given to the student. It is a surprising fact, such being the case, that so many of the arts associated intimately with the less accessible mediums, should flourish practically unfed by the schools around them. But the professed aim of the schools is to feed them, and as we see, it is quite unaccomplished. Were the students aware of the vicious system under which they work, few would be prepared to give their time for so small a return.

F. B.

## On Reflection.

### Instructions to Architects!

THE Markets Committee of the Leeds Corporation has lately invited designs for a New Market Hall, "of first-class quality and ornate character," but the language in which these "conditions" have been drawn up is not such as can be expected to encourage, much less attract, possible competitors. The members of the committee have been careful to make quite clear that they desire "geometrical drawings of the basement and each floor," and "geometrical sections" are also expressly mentioned lest competitors should seek to lighten their labours by drawing them freehand. Particular instructions are added directing that these plans and sections shall be "coloured in the ordinary manner, and on the lines, and of the number necessary, &c." The corporation is, it seems, diametrically opposed to the common usage of excluding perspective views from competitions. Elevations it does not ask, but it must have perspectives; not merely one perspective, not two, not even three will satisfy it; it demands "four perspective drawings, two showing front elevations, and two showing internal elevations." With much point and moderation Mr. George Corson, in his professional representative capacity as president of the Leeds and Yorkshire Architectural Society, has worded a letter to the Lord Mayor of Leeds calling attention to these anomalies and to other shortcomings which appear in the "conditions," and suggesting that it would be well if the "conditions" were re-cast. This letter has been printed in the "Yorkshire Post." We are not entirely at one with Mr. Corson in advocating that the name of the assessor should be published at the outset in the conditions, for though this is certainly a guarantee which would be appreciated and would popularise the competition, it is apt to influence the style of design and principles of plan adopted by competitors. On the other hand we can strongly endorse what Mr. Corson says as to the hollow futility of appointing an assessor, and, as is proposed in this case, limiting his discretion to the selecting of six designs upon which the committee shall afterwards adjudicate to determine the actual awards. Under such a division of responsibility the most that the assessor can achieve is to secure for the best design that its chance of first place shall not be less than as one to five against. This is poor consolation to a well-meaning competitor.

**A Contrast.** In contrast to the methods of the Leeds Markets Committee may be mentioned those adopted in promotion of the competition for the erection of a Kursaal and enlargement of Spa Concert Rooms for the Town Council of Harrogate. The "conditions" are, on the whole, satisfactory, and the premiums aggregating to the sum of £325 on an estimated expenditure of £20,000 are well up to the average. What is particularly to be commended, however, is the thoroughness with which the instructions to architects have been drawn up, and the pains at which the Council has been to secure the best information upon the subject of its requirements, and the perfected form in which it has presented that information to would-be competitors. Four plans, showing alternative schemes of arrangement have been drawn up by the borough surveyor. The Corporation further appointed a deputation, to visit Continental Spas, and the report of this deputation, embodying a description of the essential characteristics of a large number of Conti-

mental watering-places, and including a plan of the Kursaal at Ostend, which meets the idea of what the Corporation desires, is included with the plans and instructions, which are sent to intending competitors on application. We hope that the enterprise and the fair and open proposals of the Corporation will result in a large number of drawings being submitted, and that the Corporation will finally secure a building which will meet all the desired ends. At the same time, we notice the usual clause relieving the promoters of responsibility to appoint the winner of the first award to carry out the work. We hope that the Corporation does not overlook the fact that it is the chance of a commission, not of a premium, which induces architects to compete. The conduct of the Corporation in a recent competition, on which we had occasion to comment, leads us to doubt whether all its members quite realise that point.

### The Beautifying of London.

THE chief item of interest in the architectural world during the past few days has been the completion and exhibition of the designs for the new Government offices. We deal elsewhere with the merits of the designs, but one or two general considerations suggest themselves as worthy of remark. In the first place, it is beyond question that the new buildings will form a real addition to the worthy architectural features of the metropolis, and will add appreciably to its outward dignity. A rather curious illustration of this is afforded by the two photographs we publish this week of the buildings, now demolished, which stood on the sites to be occupied by the new Government buildings. The demolition of the block of mean houses known as the "King Street Block"—illustrated on page 127 to make room for Mr. Brydon's new Government buildings, has made possible as fine an architectural combination as is to be found in any city in the world: Westminster Abbey with St. Margaret's Church, the Houses of Parliament, and the new Government buildings about to be erected. Hardly less striking is the improvement that is to be effected in Whitehall. No one will regret the disappearance of the old building of the Royal United Service Institution, which makes room for Mr. Young's new War Office, a building which will form a worthy companion to the adjoining Banqueting Hall of Inigo Jones. Without indulging in any exaggerated laudation we may reasonably congratulate ourselves on a scheme that, when fully carried out, will make Parliament Street and Whitehall one of the finest thoroughfares in Europe. But there is also, it seems to us, another matter for congratulation. The interest aroused by the proposed new buildings is by no means confined to architects. The daily newspapers, which form a very fair index to the subjects that are occupying the public mind, have within the past few days devoted much space to articles on the subject; from which it may fairly be inferred that the average Londoner is beginning at last to take an interest in the buildings that are to adorn his city. Nor are there wanting other signs of this awakening interest. The demand that the new Vauxhall Bridge shall have some beauty of form as well as stability; the outcry against a scheme of decoration which threatens to impair the architectural features of St. Paul's Cathedral; the formation of a society to prevent the disfigurement of our buildings by coal smoke; the protests against hideous advertisements in our streets—all are signs, small in themselves, of a growing appreciation of the beautiful, and a growing sense of civic pride that may well inspire us with hope for the London that is to be.

## A "BUILDERS' JOURNAL" COMPETITION.

UNDER the heading "An Architect Wanted," we announced last week our intention of instituting a competition for designs for a country house. As we go to press this week earlier than usual, owing to the Easter holidays, we have been unable to obtain the necessary particulars from the client on whose behalf the competition is to be held in time for publication in this number. We hope, however, to publish a detailed statement of the Conditions of Competition in our next issue.

## DECORATIONS IN RELIEF.

PLASTER relief in its many forms and variations is a very familiar form of ornament, and while relief decoration has great possibilities, it likewise has its limitations. Thus too much decoration in relief is as bad as none whatever, and the one great danger decorators have to contend against in its employment is the possibility of overdoing it, while some very neat decorative effects can be obtained by the employment of pure and simple relief work. It has somewhat become the fashion of late years to decorate ceilings and walls with fabric hangings in conjunction with relief work, this latter being employed to frame off panels of silk, damask or tapestry. The walls of many beautiful drawing-rooms have been treated in this way, while the ceiling consists of a sky decoration painted upon canvas, and set in an oval or circular panel surrounded with more or less heavy work in relief.

One method of decorating a room of this description is as follows: Let all the cracks and blisters in the ceiling and wall be thoroughly cut out and filled in with plaster. The shape of the panel on the ceiling is then laid out, after which the relief work is put on either by hand with the modelling tools, or by means of any of the papier maché or moulded plaster forms. That portion of the ceiling which is to have the canvas panel is then coated over with thick paste, consisting of white lead and varnish, of such a consistency that it can hardly be applied with a brush. The canvas must then be smoothed over with a roller and the palm of the hand, and after it has been satisfactorily smoothed and the blisters have been got rid of, the edges where they meet the relief work must be nicely trimmed off with a knife. As a rule all canvas decorations are painted before they are put up with the exception of a few finishing touches. If the decorations on the walls are to be exactly the same, the method of applying the canvas will be the same; but if the panels are to be silk, the walls are first prepared with frames of wood upon which is stretched muslin, which is put on to serve as a backing for the decorative fabric. After the silk or other material is hung, it is finished at the edge with a small wooden moulding or silk cord.

Decorations of this kind are, of course, very appropriate for drawing and reception rooms where the furniture is upholstered in costly and rich materials. Many theatre lobbies are decorated with panels upon which are painted allegorical figures upon canvas with panel mouldings in relief. Hotel dining saloons are also treated now very largely in a similar manner, with canvas panels decorated with subjects illustrating hunting and fishing scenes and similar subjects. Panels of this description are also covered with fine bevelled plate glass, which adds much to the richness of the decorations as well as preserving the paintings. Another form of relief decoration in conjunction with fabrics is one which is appropriately used on hall walls. These are first covered with overlaps, which after being covered with one coating of paint, has raised ornaments placed upon it at regular intervals, the whole afterwards being painted over. W. N. F.

THE NEW GOVERNMENT OFFICES, WESTMINSTER

LIBRARY  
OF THE  
UNIVERSITY OF ILLINOIS

THE END OF PARLIAMENT STREET BEFORE THE RECENT IMPROVEMENTS.

(The middle block of houses is the "King-street Block," now demolished, and its site is to be occupied by the New Government Offices.)

## THE NEW GOVERNMENT OFFICES.

THE general designs for the two new blocks of Government offices have been exhibited to the members of the House of Commons during the last week, and by the courtesy of the officials we have had an opportunity of examining them, and publishing a selection of the designs exhibited. The perspective view and ground plan of the Westminster block are given this week, the designs for the new War Office being held over till our next issue.

Profiting by the dismal experience gained in some former large competitions, the Cabinet Committee, which is understood to consist of Mr. Balfour, Sir Michael Hicks-Beach, Lord Lansdown, and Mr. Akers Douglas, the First Commissioner of Works, decided to avoid a public competition, and Mr. J. M. Brydon was asked to prepare a design for the Westminster site, Mr. W. Young for that at Whitehall, with the assistance, in each case, of Sir John Taylor, of the Office of Works.

The exhibition in the Tea Room of the House of Commons consists of perspective views of the two designs, together with sketch elevations of both schemes, and block plans explaining the extent of the surrounding properties which it is proposed to acquire in the course. It should, however, be understood that the designs are not to be considered as the final or complete development of the scheme, but rather as sketches to show the architects' suggestions for dealing with the two sites, in order to enable the public to form some idea of what is being done.

It is very gratifying to find the present Government dealing with the scheme in so unprejudiced a manner, and what strikes us about the plans, more especially those for the Westminster site, is the large consideration given to the adjoining buildings and to the whole character of Whitehall. The buildings have not been designed as individual blocks but rather as a complete street, and a serious attempt has been made to treat the sites with the dignity they deserve. When we see what can be done by treating these matters broadly, it is the more to be regretted that such schemes, as for example those devised by Inigo Jones in the seventeenth century, and in later times by Barry, should have been unhappily set to us. However, better late than never, it would appear that now we are about to see things managed in a different spirit at West-

minster, and a scheme commenced, of which future generations may well be proud.

In dealing with the two lines of frontage, and the general grouping of the buildings, that for the War Office block is perhaps the better, for in this case, with the exception of the Banqueting House, existing buildings have not to be taken into account. On the other hand every building on the west side of Whitehall has an independent frontage line, and accordingly, the new block will line with nothing, not even with the opposite side of Parliament Street; the front will be set back a little to give prominence to the angle of Scott's building, and at the same time to correspond with the Treasury buildings. Mr. Brydon has by means of architectural screws connected the three buildings; between the new buildings and the present Home Office, a bridge is carried on three massive arches crossing the end of Charles Street; the end of Downing Street is similarly inclosed, but in this case, the street being of less width, the treatment differs in design. The arcade connecting the new buildings is in a sense necessary, as it is intended the Local Government Offices should be situated on both sides of Charles Street. The screws are of very great assistance to the architectural group, as they serve to mask the irregularity in the line of frontage and the awkward angle formed by Scott's building and Whitehall. Mr. Young in his scheme has also provided connecting screws between the existing Banqueting House, the new War Office, and a proposed additional block of buildings designed as a replica of the Banqueting House. The setting back of the new building next the Home Office has the advantage of making a wider opening at the end of Parliament Street, and thus opening up the view of the Abbey. In the original block plan the angle of Great George Street and Parliament Street was rounded, but we are glad to note that Mr. Brydon's scheme makes this corner a right angle.

The War Office scheme in its entirety, perhaps, presents a better line of frontage to Whitehall, because in this case the sky-lines of the old Banqueting Hall, the new War Office, and the future Parliamentary Library are continuous. The awkward shape of the site presents a great contrast to the Westminster block. We hope it is not yet too late to have a re-arrangement of streets, whereby a site of more practicable shape might be obtained. Classic architecture has not much chance when bestowed upon a shapeless building which merely lines a road. Mr. Young, in his design, has treated the corners of

the building in a manner which, to a large extent, minimises the effect of the awkward angles, caused by the junction of the two side streets and Whitehall. He employs circular pavilions, which, whilst they serve to accentuate the two ends, also hide, to a great extent, the inequality of the angles. The front to Whitehall is boldly treated. The two lower stories are a mass of rusticated walling, and above this is introduced an Ionic order; the columns standing free give a bold effect. We feel that the central doorway would have been better if made a more prominent feature.

The general grouping of Mr. Young's building, flanked on the one side by Inigo Jones's masterpiece, and on the other side by a replica to be used as a proposed Parliamentary Library, is exceedingly imposing, the effect when the three buildings are linked together with screens would be in harmony with Mr. Brydon's scheme, and at the same time bring the whole of the War Office front into one harmonious design; the addition to the Banqueting House, made in the last century, had a very detrimental effect, and we are very glad to see the proposal made to rebuild this addition more in harmony with the lines of the older building.

The site of the War Office was doubtless an exceedingly awkward one to deal with, and Mr. Young's treatment with circular pavilions seems to be the most satisfactory way out of the difficulty that could have been devised; we only hope that the Government will erect at no very distant date a replica of the Banqueting House as suggested by this scheme, as it seems to us that no treatment of this long front can be complete without such an arrangement.

In the "Daily Chronicle," of March 20th, appeared a suggestion by the Earl of Wemyss, who proposed to adapt the centre piece of Inigo Jones's design for Whitehall Palace. At one end would be the Banqueting Hall already existing, then an archway with the centre building arising therefrom, and at the other end a replica of the banqueting hall. Apart from anything else, this, it is contended, would provide a War Office which would fittingly balance the Horse Guards, the central arches of the two buildings being on the same axial line. How his lordship proposes to deal harmoniously with the remainder of the site, we fail to see; the chief merit about the scheme is that it is central with the Horse Guards' building, which, in Mr. Young's design, does not appear to have been considered essential.

Mr. Brydon's elevation has necessarily to be in keeping with two buildings, both lacking the beautiful proportions of the Banqueting House. It is a dignified composition, consisting of two stories of plain rusticated work supporting a Corinthian order with two stories of windows between the columns; the centre piece has a slight projection from the main block; the columns are coupled and carry a pediment with sculpture, above which rises a high attic; the two pavilions at the corners of the building repeat the outline of the towers to be added to Scott's building. The flank elevation to Parliament Square is somewhat differently treated, and is one of the most successful parts of the design.

SITE OF THE NEW GOVERNMENT OFFICES.

The general arrangements of this, which is known as the Westminster block, are shown in the plan reproduced; the circular courts were probably suggested by Inigo Jones's design for Whitehall Palace. Only a part of this scheme can at present be built, but when the leases of the Great George Street property fall in, an opportunity will be presented to complete a block of buildings having three fine fronts—to Whitehall, St. James's Park, and Great George Street—which will be second to none in London; provision is made for a carriage drive through the great circular court, and in continuation of that already existing through the adjoining block of offices. The central court is 160ft. in diameter, and the side courts 100ft. square, the smaller courts being only for lighting corridors and lavatories. A great improvement in Government offices is effected by making the average height of the

## NOVELTY IN ART.

By R. S. BALFOUR.

**NOVELTY IN ART**—How wide or how circumscribed are the limits within which we may apply the term. May we not argue on the one hand that since Art cannot live without progressive or retrograde movement, it must ever be novel, ever quickened by the influences of the day, and ever swaying to the rhythm of the pendulum of a social epoch—otherwise Art ceases to exist.

Or, on the other hand, it has been urged with no little acumen that never again can we hope for complete and absolute novelty in Art. Everything, it is affirmed, has been done before, and although fresh ideas and methods may be continually making their

periods when mankind lapses into complete indifference as to his own welfare, those total eclipses of intellectual capability which we call Dark Ages.

But given the new idea, our efforts do not relax, we see by experience that it may be improved to render it more convenient still, and we scheme to conceal its ruggedness in a becoming garb, which will not hide, but rather express to us its purpose. Here we have a concentration of the ethics of applied art, and in endeavouring to fulfil these ambitions it is, perhaps, natural that timid humanity should revert to forms already approved, either on account of their æsthetic qualities, or because of their adaptability to the media in which the experiments are being conducted.

How interesting it is to mark in chronological sequence the development of any new idea. The crude and ugly shape at its incep-

THE NEW PUBLIC OFFICES, WESTMINSTER: GROUND PLAN. J. M. BRYDON, F.R.I.B.A., ARCHITECT.

rooms 13ft., the too lofty appearance of so many public offices being thus avoided.

Considering the two schemes as a whole the result promises to be most satisfactory, more especially so in regard to the Westminster block, and in view of the debate which will most probably occur, the Government may perhaps see their way to modify the site of the War Office, since nothing can quite get over the unfavourable conditions at present imposed by the angular nature of the site. There is, on the part of the Government, an evident desire to carry out, or at any rate commence, a complete architectural scheme, and it would be much to be regretted should such a scheme be in any way hampered. They have been very ably seconded by the architects to whom they have entrusted the work.

**A memorial to Sir Henry Doulton** was unveiled last week in the chapel of St. Thomas's Hospital, by the Bishop of Rochester. It consists of three panels in terra-cotta from designs by Mr. G. Tinworth, representing the Incrudulity of St. Thomas, the Appearance of our Lord to St. Mary Magdalene in the Garden of the Sepulchre, and in the centre the Ascension. The panels are each 8ft. in height, and form a reredos.

appearance, subtly disguised with new names or with insignificant modifications, yet they are but the old notions which have been somnolent for years or centuries, taken down, as it were, from the shelf of oblivion, dragged forth, dusted and furbished up, and presented by their pseudo-inventors for the admiration of a new generation. This indeed, they say, is to subvert the true meaning of Novelty in Art, and only permits of the term being used in a very modified and restricted sense.

But surely this latter plea cannot be accepted when applied indiscriminately to all branches of Art. It is not by any means sufficiently inclusive, it fails to take into consideration that continual evolution of our every-day life, all the new requirements of education, all the tentative efforts at an enhanced civilisation, with the ultimate intention of improving our condition. These fresh demands, whatever they may be, constitute in themselves motives upon which one portion of a community lavishes an unrelenting care and effort to gratify, and thus are produced, or call it re-invented if you will, things differing in a greater or lesser degree from those to which we have become accustomed; each of these things in its turn tending towards fresh modifications or new demands, processes which will always alternate with those strange

tion, the gradual transformation from borrowed forms to a garb expressing its own sentient being, and the corresponding gradual kindling in our minds of an appreciation for newly revealed beauties, qualities which are no less real because they may only express to us utility of purpose.

Take any invention. Take the modern battleship. True, we lose in it the charming lines of the hull and the swelling curves of the canvas which marked the days of the wooden walls of England, but are we not gradually gaining in each fresh addition to our modern navy, compensating beauties—beauties expressive of might and power and strength, as well as of proportion and form. Or take the railway train; compare the modern car with the old stage coach form transplanted from road to rail, which marked the early days of steam locomotion. Surely there can be no hesitation as to which of these is the more suitable and expressive of its purpose. Now we are at the initial stage in designing the form of the motor car. We borrow the shapes of our existing vehicles, and how unsatisfactory is the result. Its requirements dictate something different, and the new form is bound to develop.

Novelty then in Art may be defined either as the suitable contrivance of fresh forms to

SEBORGA, FROM THE EAST. DRAWN BY WILLIAM SCOTT.

(From "Rock Villages of the Riviera.")

suit new circumstances, materials, and requirements, or the adaptation of new forms to such purposes, or else the adaptation of new forms to existing purposes for their improvement.

It is obviously futile within the prescribed limits of this article to attempt even a cursory glance of examination into the varying causes which govern the introduction of novelties among the innumerable branches into which art has divided itself; this specialisation results from emulation and the demand for supreme excellence, which causes art to be divided against itself if we accept the dictum that "there is but one Art." Before, however, we attempt to analyse the application of the title to Architecture, it is needful to demonstrate some generally applicable theories; referring with equal consistency to whatever branch of Art may be under consideration.

The most malignant influences against which novelty in Art has to contend are perhaps fashion and precedent. The effects of the former are infinitely more deleterious than those of the latter, which only tend to retard and fetter our brains by relieving us from the necessity of much thought and responsibility. Think, however, of the vandalism which is, and always will be, associated with the name of fashion, consider the enormities which are continually being practised for the sake of change. Had it been that fashion demanded real novelty as a postulate, how different its influence might have been! What progress the world would have made had we always clung to the one idea till a nobler one had legitimately usurped its place! But fashion is entirely dissociated with progress, it has no distinct advancing movement, it seems to revolve almost persistently upon its own axis—an orbit of wearisome repetitions and commonplaces for the most part. Grant fashion any object upon which it may fasten its greedy tentacles; it will draw all the life from it, and no matter how splendid and beautiful that object may be, it will be stultified by cheap imitation (how insincere in this instance is flattery), till it becomes nauseous to us, and with one accord we thrust it from us. Should something better be ready to step into the vacancy so formed, the loss would only be one of regrets; but often we are compelled by fashion's inexorable decree to accept something less worthy, and then how retrograde is such a change! It is not alone the mere backsliding which has to be taken into consideration, it is the slow, fresh re-advance which renewed gradual development brings about; that laborious creeping up the ladder of social progress to the point from which we fell. Frequently it appears as if we could not re-attain our former high-water mark; we seem to lack power and vitality to raise ourselves, and we

waste all our strength and mental energies in endeavouring to reach again as our goal that which, had it not been for our collective folly, we might have made our starting point for fresh progress.

I have said that precedent is an agency for economising thought. But if rightly used precedent should be infinitely more than this. It should also be a firm foundation from whence we might take an upward step toward our ideals. Precedents are the actual records of the success or failure of the experiments of explorers beyond the slowly extending radius of our store of knowledge. Each experiment is a base from which to start a wider research, or else it is a point of warning. It is a definite statement which indicates to all most plainly—the good and the bad—what is to be assimilated, what avoided, and therefore it should act as the greatest stimulant we have for the strengthening of our appetite for fresh commodities. But very frequently, precedent is not used in this manner. Its true significance succeeds in obtaining recognition with only a limited number of people. With the great majority, precedent is treated as a kind of stock-in-trade of a juggler with which to captivate the semi-ignorant, or as a ready-made mechanical apparatus, upon which to ring the changes with a half-awakened public. The great majority, too, use precedent as a means with which to eke out their meagre intellects, for it is a cheap way of avoiding difficulties and an easy method of acquiring a harmless reputation.

(To be continued.)

**The Retiring L.C.C. Architect.**—At last week's meeting of the London County Council a resolution was unanimously passed recording the appreciation of the Council of the services rendered by Mr. T. Blashill during the twelve years he has held the office of superintending architect of metropolitan buildings and superintending architect to the Council.

**Glass-paving.**—Since last November the Rue de la République, Lyons, has been paved with devitrified glass. This new product is obtained from broken glass heated to a temperature of 1250deg. and compressed in matrices by hydraulic force. The glass pavement is laid in the form of blocks, 8in. square, each block containing sixteen parts in the form of chequers. These blocks are so closely fitted together that water cannot pass between them. As a pavement it is said to have greater resistance than stone, it is a poor conductor of cold, and ice will not form on it readily, dirt does not accumulate upon it so easily as upon stone, and it will not retain microbes.

## ROCK VILLAGES OF THE RIVIERA.\*

BY WILLIAM SCOTT.

THIS book is of attractive appearance, with gilt top, printed on hand-made paper, and crowded with illustrations. It is true that many of these illustrations are not of the first order, and that the author seems sometimes to have difficulty in making his pen express textures satisfactorily. But when the reduction of the drawings is considerable, as in the little vignettes on pp. 100, 103, 119, 169, and 176—which are here reproduced—the effect is generally brilliant and telling. And even among the full-page plates one may note several of equal excellence, such as the drawings of Seborga facing pages 116 and 158, the first of which is a very well chosen subject; and that facing page 166, a view in Apricale, perhaps the most brilliant and picturesque drawing in the book. The author appears to have spent some considerable time at Bordighera, and to have pleasantly occupied his leisure in making excursions to the hill villages on the sides of the valleys near, making investigations into the Communal documents, the

\* "Rock Villages of the Riviera." By William Scott. London: Adam and Charles Black, 1898.

STREET IN PERINALDO. DRAWN BY WILLIAM SCOTT.

results of which are often very interesting, though his taste has not been sufficiently exacting in the choice of subjects for his pen. There are very few buildings of any architectural pretension in the district, though plenty of picturesque bits of light and shade to attract the artist, the buildings being mainly examples of traditional building without design, which should be instructive to a certain school of present-day architects. At the end of the book are two drawings which have a sad interest, those of the ruined church of Bajardo, which was thrown down by the earthquake of February 23rd, 1887, while crowded with worshippers. From among the ruins 210 dead bodies were taken, besides numbers of injured, and it is scarcely wonderful that after such a fearful catastrophe the villagers lacked spirit or funds to repair the church. It is the most ancient building drawn by the author, dating as it does from the twelfth century.

A great part of the book is taken up with details of prices of articles and payments for men's time, extracted from the communal account books which reach back to the end of the sixteenth century. From these a few interesting details may be quoted. At San Biaggio a mason's wage at that time was but 1 lira a day, while thirteen days of a woman's work cost still less proportionately, 2 lire and 12 soldi. At the same place sixty years later the secretary to the "University," as the Commune was called, was paid 4 lire for his year's work, a few years earlier another was paid 14 lire for three years help in writing, and the "uscieri" or bailiff's salary was but 12 lire a year! What the people lived on it is difficult to understand, for even allowing for the difference between the purchasing power of money then and now they must have had scarcely enough to keep body and soul together.

One gathers from the third chapter that the lot of villages under the authority of another village was not ideal, for human nature is much the same everywhere. Ventimiglia

(which was the principal place of the district) oppressed those unfortunate communes which were under its control bitterly, almost to the point of exciting revolt. The same chapter gives many other curious details concerning the franchise and the mode of government; and, further on, in the account of Vallebona, one reads of a women's revolt, in the course of which the Municipio was fired. This occurred as lately as 1844, so that the Government remained unsatisfactory for a long time. A curious custom is observed in one of the villages, against which it should be the men's turn to revolt. On Sunday mornings the women go out walking together and to mass, while the men stay at home to look after the babies! But old customs die hard in such a land as this, where there are still to be found people of the same family in possession of land which their forefathers held as long ago as 1471—as is the case at Bordighera, while at Seborga the name of a farm on the south side of the village is still the same as it was in the thirteenth century. Those who have sojourned at San Remo or Bordighera in these peaceful times can scarcely realise that but little more than 100 years ago the Barbary pirates were a real danger to the inhabitants of the littoral. The forts, which were armed to protect them from such incursions, occasionally fired at the wrong people under the influence of panic, as in 1811, when a small English ship suffered. The jubilation of the inhabitants was short lived, for five days later two English men-of-war appeared to exact compensation—according to one account looting the houses surrounding the piazza. Here one may buy in the market those small black figs which are a speciality of the district from twenty to thirty for a penny in the right season. The Riviera is changing rapidly, and much of interest is being swept away. The appearance, therefore, of such books as this, which seek to record the aspects and surroundings of a life which is so quickly disappearing, should be widely welcomed.

HOW THE ROMAN STATE  
HARASSES ARTISTS AND RE-  
STRICTS ARTISTIC ENTERPRISE.

BY ALFREDO MELANI.

**A**LTHOUGH the Italian nation has since the time of its consolidation, solved many legislative problems, it has not yet succeeded in solving that one regarding the commerce in works of Art.

Each region in Italy has its own laws; for instance, acts are permitted in Piedmont which are forbidden in Sicily, that which is done in Venice is not allowed in Florence and Rome, and so forth.

The region in which this legislative abnormality is most in prominence is Laziale, that is to say Rome and the Pontifical State, where exists the Pacca Edict, or a law demanding 20 per cent. duty on all objects of Art which leave the State for places abroad, among which are included, not only Paris, London, and Berlin, but curiously enough, Florence, Venice, and Milan. It is well-known that when Rome was united to Italy in 1870, the laws anterior to that date were substantially modified, with the exception however of that regarding the export of objects of Art, this was one of the laws of the old Roman State; and at Rome, the artists, the collectors, and the merchants of artistic goods are Italians, and they are all subject to this papal law.

It would be less unreasonable if the law were not unjust. At any rate, the case is typical, and as we are, above all, convinced of many irregularities, we will give a few extracts from the Edict, and from concise and irrefutable information. Having said, then, that the Pacca Edict, though a law, is a formidable tyranny the like of which does not exist in any other country, let us consider the text of Art. XII., which is the most monstrous. It reads thus:

"Any article or object of fine Art which it is desired to export from the Provinces of the State, and from this city of Rome to the Provinces, or other countries, shall be submitted to the most rigorous inspection, reserving to ourselves the right to permit its relative extradition, and consequently annulling by the express command of his Holiness every order or custom to the contrary."

STREET IN APRICALE. DRAWN BY WILLIAM SCOTT.

(From "Rock Villages of the Riviera.")

Evidently then, to possess an object of Art in Rome is undoubtedly a misfortune, and especially so if the possessor thereof desires to move from one place to another. Hence his ownership of an object of Art in the Pontifical State may at any time be challenged, or, which is little better, the article itself is reduced to almost one-fourth of its real value. For, in substance, what is signified in the legitimate possession of an object? most assuredly the possibility of selling it or of conveying it from one place to another without let or hindrance. Hence, from the Pacca Edict results this strange anomaly: that a work of Art is not the property of who so possesses it in his own house, because he cannot sell it. Nevertheless, it is the property of none other, for no one may move it from the place it occupies. Let us take an example. Suppose a family which by division, abundance of children, or breaking up even, has fallen into a less flourishing condition, and happens to have in its possession a picture or a statue of high artistic value. They find that by selling the picture or statue, as the case may be, they can greatly improve their financial conditions.

But here the Government steps in as it often does and demands the indefinite postponement of the sale; the would-be buyer

caused by the Pacca laws to the artists of Rome and of the old Pontifical State. Truly Cardinal Pacca sought to parry the monstrous contradictions with logic, and with common right, because in his Edict and particularly in Art. IX he declares that the measures prohibiting the export of objects of Art, were imposed with the express object of favouring the collections of the Pontifical State. The good prelate therefore runs away with the supposition—decidedly a bold one for his time—that the Government could prevent anyone from sending his goods for sale abroad in order to reserve for itself the right of buying them. It is, however, necessary to remember that when the Edict became law (it bears the date April 7th, 1720) his idea was totally different from that which obtains to-day with regard to the rights of the citizens. Hence this unjust application of the Pacca Edict is more injurious to its supporters than they themselves imagine. At the time of its introduction even, this decree was, to say the least, unreasonable, but to-day it is directly imprudent and tyrannical. I speak thus because at the time of its introduction there existed in Rome, and its Pontifical provinces, a state of great prosperity, not only constitutionally but also individually; hence both the government and the people were well able to afford the precious antiquities which were then for sale. But to-day this is not so. And so corrupt was this Edict considered by the Parliament of 1871 that they separated it from the national laws and limited its application solely to the province in which it is now in force, namely, the Pontifical State. Therefore, with the acceptance by our legislators of this Edict, there is created a special condition which concerns all those who possess objects of Art, and also those who trade in them. This state of affairs is decidedly offensive to the political and national sentiment, which issued forth triumphant from the local revolutions which formed the kingdom of Italy. This fact has also been the cause of repeated agitations in which the public institutions have taken part. The Chamber of Commerce of Rome made representations in 1891 to the government with regard to the abolition of this famous Edict.

The Papal Government checked the export of objects of Art from Rome and from its provinces, and often acquired for themselves those articles which would otherwise have been sent out of the country. The Italian government also checked the export of those objects of Art, but not with idea of acquiring them for itself. Of course, it is quite admissible that the State should have the preference in the sale of a work of Art, but on the other hand the State should not make capital in the exercise of that right; it is not just that it should form such vexatious laws against the wish and contrary to the interests of the people. And again, how odious is the manner in which this law is enforced; so odious is it that one is almost inclined to believe that in point of freedom our own Government is behind the Pontifical Government which would always, in cases of probable sales, grant a suspension of the Edict, whereas our own Government would not admit of any transaction. Here is an instance: a short time ago a gentleman was about to sell a piece of sculpture to some one in either London or Paris—I do not recollect which—but he found that it would be necessary to send it to the buyers, and was of course quite prepared to pay the duty of 20 per cent. to export the sculpture. But the Italian Government, basing themselves on the Pacca Edict, would not hear of it. The owner, however, declared himself quite ready to pay the duty, but the officials were so jealous of the aforesaid interests of the State, that the sculpture remained in Rome.

It is incredible that such a monstrous measure has not or has not had enemies among the members of the Government; there have been proposals made for the conservation of the monuments with the object of annulling the decrees and Edicts which were instituted in times when there prevailed exaggerated notions of the power of the populace. But up to the present these proposals have either been wrecked on the occasion

PORTA DEL CAPO, BORDIGHERA. DRAWN BY WILLIAM SCOTT.

of their discussion by the two chambers, or else they have not been discussed at all. And, in fact, with regard to her legislation in matters of Art, Italy to-day finds herself in a position not merely illogical but ridiculous.

That which the legislators of the two chambers have, up to the present, been unable to give to the country, Italy has reaped for herself by the good sense of her tribunals. Here is only recently an important decision touching the application of the Pacca Edict. It arose in the Court of Appeal of Rome, in which it was established that the Pacca Edict should be applied to the rare and precious only, and not to every object of Art.

Conclusion: it is right that things artistic should of necessity be confined to their own country, and if the State cannot buy them, it should not hinder others from doing so.

At the same time we wish to exercise a little reserve—as the Court of Appeal of Rome has done—when considering works either artistic or historical which are of recognised and undoubted value—a painting by Raphael, or a piece of sculpture by Michel Angelo, or a bronze by Cellini; but as regards the rest—absolute liberty.

Exaggerative, restrictive, fiscal laws made harsh by tyrannical application will serve no other purpose to-day than the encouragement of contrabandism and immorality.

STREET IN BORDIGHERA (VIA DEI BASTIONI). DRAWN BY WILLIAM SCOTT.

goes away, and thus the family is left in its embarrassment.

Again, let us suppose that I am by profession an antiquary, and am carrying on business in Rome, and perceiving that Florence is as much a part of Italy as Rome, I find it advantageous to abandon the "Caput-Mundi," and to move my business to the country of Dante and Michel Angelo. I decide to go, and, being a good and honest citizen, I see no reason why I should not be able to carry into effect my decision. When, behold! a good and honest state official, a connoisseur in the matter of Fine Arts, informs me that I shall have to pay 20 per cent. duty on every article of my stock, as valued by himself. In case I had not the funds wherewith to pay the sum demanded, the Pacca Edict is enforced, and I am obliged to remain in Rome, which place I was leaving, perhaps, on the score of ill-health, probably on account of the malarial fevers which afflict thousands of this capital of Italy. And this is liberty! Or is it not rather an offence to every elementary civic right?

Again, the Pacca Edict does not affect only the ancient works of Art. This Imperial decree affects the works of modern Art ten years after the death of the authors thereof. Who knows the affairs of our Italian artists? and who knows how many of their works they sell in other countries?

It is not necessary to say very much in order to convince anyone of the damage which is

## A CHAT ON DECORATIVE AND ORNAMENTAL IRONWORK.

By W. N. BROWN.

IN the course of the following lines I purpose making a few remarks on architectural, decorative, and ornamental ironwork which may be of use and interest to my readers, especially the younger ones among them. At the outset I may mention that ornamental ironwork, as employed in buildings, is of greater antiquity than the same metal employed structurally, the former being of wrought iron, forged by the blacksmith, and consisting of necessary fittings to an edifice to which a certain ornamental or decorative character had been imparted.

Amongst these members may be enumerated hinges, locks, bolts, handles, knockers, grilles, screens, and other forms of internal railings; palisades, and other external railings, vanes, terminals, and finials, gates, and lattices, and torch-holders, extinguishers, and ironwork for coffers and chests. The clever smith of the Middle Ages found great scope for his ingenuity and taste in the fabrication of hinges for the external doors of cathedral churches and baronial castles; the hinges to the doors of modern dwellings are made as small and inconspicuous as possible, but the ancient wrought iron hinges were expanded into a wealth of scroll work, which extended over the greater part of the door to which they were attached. Such hinges, of which a few are still in existence, are verily marvels of true ironwork. It must also be borne in mind that the amount of manipulative skill required to produce really artistic ornamental forgings is very great. Cast iron decorative work, however elaborate, may be produced with facility. A carefully constructed wooden model or "pattern" is put into the iron founder's hand, and it is an easy task to "mould" this in his wet sand, and to produce a perfect copy in cast iron. But the smith perhaps simply works from a sketch, a chalk drawing on the back of the smithy door, and all the forming of the iron into curves, or other decorative shapes, must be done while the metal is red hot, and all joinings required effected by welding the parts together while they are at white heat. Thus it is obvious that when the smith becomes an art worker he labours at a greater disadvantage than does any other artisan. He has no opportunity to give prolonged consideration to his work while it is in progress, but must veritably "strike while the iron is hot." Another disadvantage under which he labours is that, unlike other workers, he is not expected to avail himself of any means, other than welding, of forming joints. The carpenter, joiner, and cabinet-maker have multifarious means of joining their material—wood—from which to select, uniting by mortice, by tenon joints, by dovetails, by dowels, with the aid of pins, nails, screws, spikes and glue. But the smith has only his own expedients of uniting the two pieces which he desires to join, by hammering them energetically while they remain in a state of white heat. Moreover, he is extremely restricted as to tools. The wood worker has the whole and varied contents of his tool chest to fall back upon. But a good smith is only expected to use such tools as he can use while the iron is hot, i.e., hammer, anvil, punch, and, perhaps, swages and chisel. But after his work is cold he must not touch it up with the file or other implement. It is *de rigueur* in good smiths' work that all the forming should be done at the anvil while the work is heated.

As an exemplification of the manner in which the smiths would go to work to produce a good piece of Ecclesiastical ironwork, let me take a fine example of Middle Age ironwork from the door of the church of Neury Saint Sepulchre in France, which is to be found engraved in the late M. Viollet-le-Duc's treatise. This is early twelfth century work, and the most superficial glance at it cannot fail to convince the observer that the smith who made it was an adept in

the use of the hammer, and especially in neat and masterly welding. When it only concerns uniting small branches to a central stem, the business presents no difficulty to a fairly expert smith. But to unite branches into a kind of central enlacement, or union, requires a very skilful hand. These "sham" hinges, for such they are, for the French church door present unquestionably very real difficulties. In order to get the welds made, the smith, unless extremely adroit, would risk burning his iron, for he is under the necessity of making several fresh heats at the same point. The smith would here commence by forging the centre piece with the four left runs. He would then hammer out the scrolled branches forming the bulbous extremities into an eye, through which the shank of a square headed nail can be driven to affix the ironwork to the door. Lastly, these arms or branlies will be scarfed or welded to the central parts, an operation which is not without difficulty in performing perfectly. Another French hinge, also adduced by M. le Duc, is from a door of the Church of St. Saturnin, at Moulis, in the Department of the Gironde. Here we have shown the bar of iron for the branch, which the smith has first slotted at the side to get the piece from which to make both the two large end volutes or scrolls, and also the small curves along the outer curve. This is, of course, a much simpler example than the preceding one, and, much easier to execute, as there is but little welding of joints, and these not difficult. Another example is the half of a piece of elaborate hammered ironwork from a door of the celebrated Cathedral of Notre Dame, at Paris, the whole of which is to be found figured in the work entitled "Statistique Monumentale de Paris." In this, the smith fixing up his design on the wall beside him, would commence operations by forging each of the branches separately. As a necessary preparatory step to this he would have to make "top and bottom tools," or "swages" for each of the leafy designs which terminate the branches, and which are all different. He would scoop the other end of each piece forged to a suitable taper for welding on to the central stem. The latter having been made of smaller size than the desired final dimensions and its terminal swaged out, several heats would necessarily have to be taken to get all the branches neatly and soundly welded on.

The preceding examples were French work; now I will cite a specimen of English work, which is a beautiful wrought iron hinge of the thirteenth century work from Leighton Buzzard, and as in the preceding lines I will endeavour to give some particulars as regards the method in which this piece of iron work is constructed. I will suppose that a small drawing of the proposed hinge is put into the hands of the smith by the designer. The first step made by the smith would be to enlarge the sketch to the full size of the hinge desired. This he would probably do in chalk on the wall or door of the smithy, so that he could verify the correctness of his work by applying the actual iron pieces to the drawing. Most likely he would next make "templates" (or accurate patterns) of all the flowers and terminal scrolls of the leaves out of sheet iron or zinc. He would then "scribe" or mark, around these templates on a piece of iron of the desired thickness until he had done a sufficient number, when he would cut them out with the cold chisel and hammer. In the meantime his assistant would have been forging a piece of stouter iron to the rude rough shape of the central stem and the rudiments of the projecting branches. The smith having cut out a sufficient number of pieces of iron to the shape of the templates would next proceed to boss them out of the hollow form. For this purpose he would use a pair of tools known as "top and bottom tools," which are really swages, one being convex or in relief, and the other concave or hollowed out. When the smith had made a pair of these tools he would put the shank of the bottom tool in the hole at the end of the anvil, so that the upper part of the tool rested on the anvil

itself. Next he would heat the leaf already cut to shape, place it in this concave bottom tool, and hold the top tool upon it by the withy, or reed handle. An assistant would then strike the end of the top tool strongly with a heavy sledge hammer. It would probably require two or three beats to knock and boss the leaf into its proper form. Having made a sufficiency of these leaves the operator would chase them up a bit, scarfe the ends ready for welding on, and put them aside. Next the smith would most likely go on with the scrolls. He would first take a bit of twine and bend it around one of the full-rigged scrolls in his sketch. This would give him the exact length required, to which he would cut a piece of iron of the proper width accordingly. He would then proceed to make some swells at the right distances, so as to leave plenty of metal from which he could forge the bays or semi-circular swells that are found at different intervals upon the scrolls. When he had finished this he would probably set about bending the scrolls to the required curves. He would not be able to do this in one heat, but would have to bend part of the scroll at a time. He would make his iron hot, and with the scroll wrench and fork form part of the scroll. The smith would then continue until he had, after repeated references to his sketch, obtained the correct scroll.

Having gone so far, he would have to make top and bottom tools the exact sweep of his scrolls, so as to bump out the iron into the proper section. He would then, with various heats, and the help of his assistant with the sledge, follow the scrolls around until he had everywhere given them the required section. He would also have to make special top and bottom tools for the scrolls, for which, as I have previously said, he would have taken the precaution to leave a sufficiency of metal. He would then, in the same manner, complete the rest of the scrolls, and, after scarfing the ends to prepare them for welding; would set them on one side with the leaves and flowers, while he got on with the stem or main centre part. This, already roughed out by the assistant, would be of thicker and heavier metal than the scrolls. A pair of larger top and bottom tools would have to be made to aid in bringing this to the proper section. Having now, I will suppose, completed all the parts of the top of the hinge, the smith would probably commence with the small work, and "shoot" or weld all the leaves and flowers on in their proper places. When he had done this, he would join the smaller scrolls to each other, and then finally shoot them altogether on to the main stem. And after, with his top and bottom tools, having brought all the edges of his junctions into proper form and shape, and arranged the whole concern in conformity with his drawing, he would set about putting the finishing stroke to the job by making the clips or collars. These collars very often serve the purpose of hiding the joints and junctures of the scrolls, but in the example which I am considering, they certainly would not be employed for this purpose, and are evidently only applied for the sake of appearance. After these collars had been forged into their proper shape to overlay the scrolls and stems, they would be rivetted either with rivets from behind or from the front, and have their heads burred over, and the ragged ends effaced with file and chisel. The cable-like design on the collars on the main stem would probably be chased with a hammer and chisel when the work was cold.

**A New Wing** has been added to the Rawdon Friends' School. It includes a workshop, chemical laboratory, and lecture room.

**A memorial window** to the late Ven. Melville H. Scott, M.A., was dedicated in Ockbrook Church, last week. The window has cost about £80, and the subject represented is "The Good Shepherd."

**Reconstruction of Dunscore Free Church.**—The old Disruption Free Church of Dunscore has been reopened after architectural alterations and reconstruction. The total cost of the reconstruction is about £900.

### SANITARY SAFETY.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Numberless and varied are the efforts made to obtain this nowadays. Houses are surveyed, inspected, and tested over and over again, until the owners must really begin to look upon this supervision as a weariness to the flesh. It would be amusing, were it not too serious a matter, to consider how much of this testing is more misleading than really useful, even when carefully done by trained and qualified men. The so-called testing performed by inexperienced and interested people is, of course, unworthy of serious consideration.

It is curious how difficult it seems for some people to grasp the fact that it is foul air we are fighting. Nothing is more common than to see a beautifully finished plan with all the sewage drains coloured red and all the R.W. drains in direct communication with them coloured blue, the designer failing to realise that it is not so much what passes down as what comes up a drain (in the shape of foul air) that is the insidious foe. Often I have found the actual drains quite sound, while no attempt had been made at all to render the access-chambers—an integral part of the drainage—air or even water-tight.

As the Indians say, "Water never sleeps." There is something honest and searching about water, and the hydraulic test is positive and excellent so far as it goes. But it does not test manhole covers when fixed in place, nor in any occupied house does it test any higher than the lowest connection to a vertical soil pipe.

Then again smoke, and all smell-tests, simply give negative results, and the engineer reporting after their use, generally employs some such words as "No leakage was detected," which may or may not be satisfactory! The only positive test which enables us to say at once, "The sanitary system of this occupied house is air-tight from disconnecting-chamber to the tops of the ventilating-pipes, including every joint and connection," is the pneumatic test. It shows instantly air-leakages which water only shows very slowly, if at all, air passing freely and at once through tiny interstices, practically impervious to the passage of water.

I have quite come to the conclusion, after very many years practical testing, that a sanitary survey without this test is unworthy of the name, and, in short, not worth paying much for!

CHAS. E. GRITTON, A.M.Inst.C.E.

### MOISTURE DURING FROST.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The "Writer of the Answer" on the above subject, in your issue of March 1st, has now, in yours of March 22nd, sought to justify his answer by doubting the equilibrating property of heat, and in doing so, asks the meaning of certain phenomena in three illustrations, which he gives; but not one of which is, unfortunately for him, applicable to the case it is intended to serve. If this gentleman cannot agree with me, why does he weaken his case by stating that there is "much difference of opinion," and then (in the seventh line), by giving his case away altogether. Where is this difference of opinion? Surely not among experts on so simple a matter. Then after admitting that different materials will eventually attain the same temperature under similar heat influences, why write such a long letter to deny it? But "Writer" may say that he has qualified his admission by the word "eventually"; that is to say, that during the mere process of acquiring or losing temperature, there will be found a difference of temperature in substances of different conducting power. What else can be made of the illustration which he gives of the pieces of wood and iron exposed to zero, &c., for fifteen minutes? The youngest of your readers must see that he is catching at a straw. What happens? A piece of iron, at any ordinary temperature, placed in a tem-

perature of zero, will quickly acquire the temperature of its surroundings, and a piece of wood similarly situated will follow a little less rapidly, but it will "get there" all the same. During the few minutes that this process takes there will of course be a difference of temperature, and it is upon this that he will "guarantee that it won't need a thermometer to differentiate between the temperature of either."

I would remind "Writer" that in the last sentence of my criticism I distinctly pointed out that there were circumstances under which the better conductor would be colder under cooling influences, simply because it was a better conductor. One of these "circumstances" would be where, for example, an iron girder, partly inside a heated room and partly exposed to a cold external atmosphere, would continue to conduct heat rapidly from the interior to the exterior as long as the supply of heat lasted and the uneven balance existed; and the temperature of this girder would be something less than that of the room, and something less than that of a wood beam similarly placed. Here, perhaps, we agree. But it should be remembered that this, like our friend's illustration, is only during the process of establishing an equilibrium (although in this case, from its situation, it takes a long time) and the rule holds good, that when the balance is established, the temperature remains uniform for all materials until again disturbed. But paper and paint are entirely inside the house and will not differ.

Regarding the remaining two illustrations which "The Writer" gave. The first was that "a thermometer placed upon the grass during a cold night will register differently from a similar instrument suspended a foot from the ground," which is intended to show that two different temperatures can exist under the same conditions in dissimilar substances—presumably the grass and the air—in consequence of the greater conductivity of one of them. I need hardly remind your readers that the difference of temperature in the case referred to is the product of radiation in a diathermal atmosphere, whence comes dew and hoar-frost, and conductivity has practically nothing to do with it.

The next illustration is equally surprising. He asks why, in two similar thermometers—one with a wet bulb and the other a dry—will there be recorded a difference of temperature? It should hardly be necessary to answer this question, but as "The Writer" asks it, I may say that the wet bulb is kept colder than the dry bulb by reason of the absorption of the heat necessary to the formation of vapour, which heat is gathered from the surrounding air and from the mercury itself; and, according to the demand (i.e., the dryness) of the air, so is the vaporization, and so the difference of temperature. But this difference of temperature is the result of a special exciting cause—as in a freezing machine—and in no sense can be taken as any proof of "The Writer's" theory.

The point at issue was whether or not wall paper is warmer than paint. "The Writer" argues—both at the middle and end of his letter—that because a painted wall will show more moisture than a papered wall it must therefore be colder. I have already shown, that both being inside and other things equal, the temperature must be the same. I now have to explain why the one shows more moisture. Wall paper, itself porous, is usually hung on porous lime plastering, the absorbing power of which is very great, and as fast as vapour is condensed thereon it passes into the material (I could give abundance of evidence of the excessive greediness of dry and nearly dry plastering for moisture), therefore nothing shows on the surface. But with an impervious covering, as paint, it accumulates on and trickles down the surface. But there are cases where paper is hung on an impervious wall. What happens then is what I have often seen—the paper gets sodden, and often peels off of its own weight. So that the alleged difference of temperature does not save it from condensation.

"The Writer's" remarks in both of his communications on moisture in the atmos-

phere also need criticism, but I am afraid that it will not be very edifying to your readers to pursue the subject further, and I have neither the time, nor, perhaps, you the space, to expend upon it.

"ENGINEER."

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### MAKING BLUE PRINTS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I should be very much obliged if you could give me information as to the method of copying tracings by the blue process. 1st, How the chemicals are composed and mixed; 2nd, method of printing; 3rd, what paper is best for the purpose? 4th, can sensitised paper be had ready for use, if so where? 5th, how long should it be exposed in a good light?—Yours sincerely,

Bridlington.

"BRICKLAYER."

(1) For the production of white lines on a blue ground, the only chemical required is water, either cold or tepid. (2) Thin white or blue (not yellow) tracing paper should be used, and the lines drawn in with a perfectly black ink, washes and colours being avoided. When dry, the tracing is placed in a large specially made "printing frame," like a picture frame, having a glass front. The frame should be put on a table or floor, glass downwards, and the backing removed. Then the tracing is put in with the ink lines uppermost (away from the glass), and the sensitised paper placed on it, with the sensitised surface in contact with the tracing. The back of the frame is then replaced and tightened up, a piece of felt being often inserted between the paper and the wooden backing. All the above work should be done in a subdued light, but now the frame may be removed into bright sunshine or good diffused daylight without shadow. The back of the frame is hinged much as is that ordinarily used in printing photographs, so that the progress can be watched by occasionally turning back one half, observing what is occurring, and closing the frame again. When the margin of the paper shows a grey metallic colour, exposure has proceeded far enough; a few experiments should be made before serious work is attempted, however, as it is at this stage that mistakes are most likely to occur. The print should now be taken out of the frame again in dull light and completely immersed in a basin or trough of water for about fifteen minutes, with care to avoid and remove bubbles at once, by which time the lines should appear perfectly white. After a further rinsing in clean water, the print may be hung up to dry. (3) Ferro-Prussiate paper or cloth. Blue lines on white ground are obtainable by using Ferri-Cyanide Paper, and black lines on white ground by Ferro-Gallic Paper; but in both these instances Prussiate of Potash or Gallic Acid has to be used for development, and the process is slightly different from that described above. (4) Yes, from any photographic dealers, such as Hinton and Company, 38, Bedford Street, Strand, W. (5) In bright sunshine from fifteen to twenty minutes, and varying from this to as much as two hours in diffused light in dull weather.

G. A. T. M.

A stained-glass altar window has been placed in the Parish Church of St. Mary, Isles of Scilly.

Treasure in the Main Sewer in Thorn-gate (which had recently to be opened) was found to the extent of nineteen sovereigns, several silver coins, silver spoons, a diamond ring, and other valuables. The Urban District Council came to the conclusion that anything found in the sewers belonged to the Council.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
April 5th 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

**The St. Paul's Decorations.** THE decoration of the second of the four quarter domes has just been completed, and the effect is greatly to heighten the contrast between the somewhat gaudy brilliance of the decorated parts and the sombre dignity of the nave. In view of the controversy that Sir W. B. Richmond's work has aroused, it may be of interest to state who compose the Decoration Committee, under whose sanction the scheme is being carried out. It consists of the Dean, the four Canons, the Bishop of Bristol, Lord Lothian, Lord Brownlow, Dr. Edwin Freshfield, and Mr. Sumers Clark, the surveyor to the Cathedral. The controversy shows no signs of abating, and a question on the subject was asked a few days since in the House of Commons. Mr. Balfour replied to the effect that the matter was not one in which the Government had any power to interfere. Obviously the best course for those who are anxious to stop or modify the present scheme is to urge their views upon the Decoration Committee of the Cathedral.

### Future Plans.

WITH respect to the future course of the decorative scheme, Archdeacon Sinclair said, in the course of a recent interview, that he believed the whole of the plain stone round the dome was to be stencilled, but not below the base of the arches, and of course it was intended to fill in the other two quarter domes below the whispering gallery. The probability was that the drum of the dome all round the whispering gallery would be treated in mosaics, subjects bearing on the Conversion of St. Paul being chosen. Then it was likely that Sir W. Richmond would treat in mosaics, but in a lighter way, the north and south aisles of the choir. It is noteworthy that up to the present neither Sir W. Richmond nor any member of the Decoration Committee has made any public reply to the criticisms that have been so plentifully bestowed upon them.

### Bradford Fire Station Competition.

THE Bradford Watch Committee had before them last week the architects' protest, recently published in our columns, in regard to the award in the recent competition for plans for the new Fire Brigade Station. The committee decided that the conditions had been fully complied with, and awarded the first prize to plan No. 1 of the alternative designs sent in by Messrs. Mawson and Hudson, of Bradford. We are not much surprised at this decision. It is human to err; it is also human to refuse to admit that one has erred, and town councillors are not more willing than other people to eat humble pie. Moreover, it is quite conceivable that the committee in their ignorance, really think they have acted fairly. We can only hope that the next competition—that for the Cartwright Memorial Hall, which is now being advertised—will be conducted in a manner that will satisfy the competitors as well as the judges.

### Baptist Chapel at Sutton.

THIS building is erected in the High Street, Sutton, Surrey, and is built of undressed flints and best stone dressings. The design is an attempt to give by a simple treatment some ecclesiastical character to a building intended for congregational worship. The chapel has a single span roof, with no supports interfering with the comfort

of any sitting. Mr. H. D. Searles Wood, F.R.I.B.A., of 157, Wool Exchange, Coleman Street, was the architect; Mr. R. J. Humphries, of Sutton, was the builder.

### St. Mary's, Moorfields.

AN interesting London church, which will shortly be demolished, is the Roman Catholic church of St. Mary's, Moorfields. The present building, erected in 1820 from designs by Mr. John Newman, stands on the site of a much older building. The church contains some beautiful decorative work, including two great pictures painted by Aglio, representing the Crucifixion and the Assumption. These were originally executed in fresco, but they became so injured by the London climate that it was found necessary to repaint them in oil. The effect of the picture of the Crucifixion seen through the colonnade of the apse, with the light admitted from an invisible position, is decidedly impressive. Over a side altar in the nave is a good portrait of Sir Thomas More. The holy water stoups are held by two life-sized angels in white marble, and slabs of the same material record the memory of several bishops. There is also a memorial to Cardinal Wiseman consisting of a large slab of marble on the floor of the chancel.

### Destruction of Refuse.

ONE of the most economical and generally satisfactory ways of dealing with town refuse, is to destroy it by means of the Horsfall destructors, which are in use at Edinburgh, Bradford, Oldham, and elsewhere. A valuable report on the subject has recently been issued by Lord Kelvin and Professor Barr. Dr. Cameron, the medical officer of health for Leeds, found in recent trials that this destructor will consume daily 26½ tons of refuse per cell; but at Oldham the highest fuel value is obtained by a consumption of 10 tons, and Lord Kelvin and Professor Barr are of opinion that a low blast pressure equal only to one inch of water secures in this and other respects the best results. At such a pressure the Oldham refuse has, they find, a fuel value about one-seventh that of good steam coal; and it consists of the contents of open cottage ashpits, fish offal, and market garbage. A plant destroying 650 tons a week saves the Corporation £545 a year, and produces mortar, clinker, &c., of a value exceeding £1000 a year; while the cost of labour is about 9d. per ton—at Bradford only 6d. The refuse alone is burnt; yet the result of tests made both at Oldham and Bradford was to show that only a trace of smoke emerges from the chimneys, containing neither hydrocarbons nor carbon monoxide. "We are convinced," the report says, "that properly constructed plants, such as those inspected at Edinburgh, Bradford, and Oldham, cause no inconvenience whatever. The absence of smoke is such as is attained in exceedingly few, if in any, power plants using coal as fuel; while the complete destruction of organic matter is secured."

### Birmingham School Board and Architects.

AT a meeting of the Birmingham School Board, on March 24th, the Sites and Buildings Committee reported that they had considered the question of the employment of architects, and had come to the conclusion that it would not be in the interests of the Board or the ratepayers to make any change in the existing arrangements, by which particular architects were employed by the Board. Mr. Milward, who had originally raised the question and caused it to be referred to the Committee, said that the report did not touch in any way the points which he raised six months ago, which were that they were not enjoying the best return for their money, in not being able to contrast the plans of other architects with those whom the Board employed. There were in Birmingham at least ten architects who were constantly employed outside their native city in the erection of schools. It was an extraordinary thing that because of an old-standing resolution these gentlemen should be debarred from erecting schools in their native city. He objected strongly to the one-man system, which he

BAPTIST CHAPEL, SUTTON, SURREY. H. D. SEARLES WOOD, ARCHITECT.

considered was a gross injustice to other architects. An amendment was moved by the Bishop of Coventry, "that the report be approved, with the exception of the portion which relates to the architects." Mr. Kendrick held that the advantages of the present scheme considerably outweighed the disadvantages which usually accompanied monopolies. It was a great saving of time to the members of the Board and the committee. Open competition was very well where schools were built once in ten years, but where one was built once a year he contended it would be a serious tax on the members of the committee. The voting on the amendment was seven for and seven against. The chairman gave the casting vote against it, and the report was carried. Although this decision is very unsatisfactory, we are pleased to see such interest taken in Architecture by public bodies in Birmingham, and we wish that more was shown in London.

### Workmen's Compensation Puzzles.

We have more than once referred to the extreme uncertainty in the operation of the Workmen's Compensation Act. A grimly humorous cartoon on the subject by F.C.G. appeared in the "Westminster Gazette" a few days since. Two crippled workmen are conversing together, and part of a funeral procession is seen in the background.

"WORKMAN (*minus a leg*): What happened to me? Scaffolding gave way and I fell off the top of the house. Compensation? I didn't get a ha'porth—the lawyers said as how I didn't come within the Act, because the buildin' was only 29ft. 11in. high.

"WORKMAN (*with crippled arm*): That's bad luck. I only fell a matter of 15ft., but I got £100 at last after the lawyers had tried it three times. How was that? Well, they found out the buildin' was just 30ft. 6in. high, and that brought me inside the Act, so they said. It's a rum Act, ain't it? There's poor Jack Hodge bein' buried to-day. He was killed on Mr. Smith's farm and his widow don't get a farthing'!

"How's that?"

"Well, you see, he was only an agricultural labourer, and they don't count accordin' to the Act."

It will be remembered that one of the great recommendations of the Bill before it became an Act was that it would make litigation unnecessary.

### Art Exhibitions Abroad.

An interesting and instructive commentary upon our national scheme of art education has recently been made in connection with the exhibition on the Continent of works done by students in the schools of art of the United Kingdom. M. Radisics de Kutas, director of the Royal Hungarian Industrial Art Museum at Budapest, visited at South Kensington the exhibition of art school work which had obtained prizes in the annual competition for 1898. He was favourably impressed with the excellence of the work, and his report on it to the Hungarian authorities resulted in a request from Hungary for the loan of a number of the works for special exhibition in Budapest. The consent of the students having been obtained, the works were sent to Budapest. Many of the leading Hungarian newspapers have commented very favourably on the drawings, and the Hungarian authorities have given a very practical exhibition of their estimation of them by purchasing thirty.

### The Value of Art Exhibitions.

At the opening of the Fifth Annual Free Picture Exhibition at the Public Hall, Canning Town, Mr. Val Prinsep, R.A., made some very interesting remarks on the value of art exhibitions. He said it was the privilege of many towns in England to have public libraries where facilities were given to the public for reading the best works of the masters of literature. But in an exhibition such as that now opened, the public had a far better thing than public libraries, for in it all people could read the open book of the artist,

and could learn that there was a life above the life in which they were engaged daily, and see what the great artist of the past and present had provided for them. Art taught that there was something of beauty all around, and such pictures as those hung in that gallery were excellent examples of the old words, "Whatever thy hand findeth to do, do it with all thy might."

conference with the recently formed Coal Smoke Abatement Society, and medals, specially designed by Sir W. B. Richmond, R.A. will be awarded by the society for the three best domestic coal smoke appliances. We have previously referred to the aims and methods of this useful society, but we make no apology for reverting to a subject which must interest all who desire a cleaner and a healthier London.

## PRESTON CHURCH.

HADDINGTONSHIRE.

EAST GABLE.

Plan

SCALE OF FEET

### Preston Church, Haddingtonshire.

This quaint church is situated in the out-of-the-way village of Prestonkirk, East Linton, Haddingtonshire. It was built in 1770, enlarged in 1824, and some internal alterations were made in 1892. A panelled and carved screen was then erected, and the wall between the church and the vestry beyond, was removed. The church stands on a slight eminence, and the east gable, seen from the road, has a very pleasing effect, being partly covered with ivy. The rest of the church is rather bald in appearance. It has a square tower with an ogee-shaped roof. The measured drawings of the gable which are reproduced on this page were made by Mr. W. H. Mason.

### Coal Smoke Abatement.

ONE of the most interesting sections of the forthcoming Building Trades' Exhibition will be that devoted to coal smoke abatement appliances. The project is the outcome of a

The Society is moving along practical lines towards a goal which is not only desirable but attainable. It has some very powerful supporters; but its success will, of course, depend greatly on numbers, and also on the funds at its command. Wherefore it may not be out of place to point out that the hon. treasurer is Dr. H. A. des Vœux, of 8, James Street, Buckingham-gate, S.W.

**Cottage Homes for Chard** are to be erected in commemoration of the Diamond Jubilee. Messrs. Symes and Madge, of Chard, are the architects.

**A motor-car factory** is to be erected at Coventry, on the Radford Fields Estate, at an estimated cost of £10,000, from plans by Messrs. Harrison and Hattrell, of Coventry.

**A new church** has been built by the Kirkcaldy Unitarian Congregation in Hunter Street, and the architect is Mr. A. S. Taylor, A.R.I.B.A. The cost of the building, including the site, was about £1100.

## Views and Reviews.

### GLOUCESTER CATHEDRAL.

Gloucester possesses one of the most interesting of English cathedrals, interesting alike to the artist and to the archaeologist. The beautiful cloisters, the choir and lady chapel, and the tower, are a continual joy to the form; while to the latter, the curious way in which the old Norman work has received a later facing is a study of abounding interest. Some drawings by Mr F. S. Waller, the cathedral architect, showing how the choir was cased by Abbot Staunton, 1337-1351, and what is now left of the church of the twelfth century, explain this very clearly. The photographic illustrations, as is usual in this series, are of a high order of merit, although some of them have perhaps suffered somewhat in the printing. That of the S.E. chapel in the Crypt is particularly good. There are also a few black and white drawings, by Mr. E. J. Burrow, of features in the precincts and of various bits of old Gloucester. The author of this volume, Mr. H. J. L. J. Massé, M.A., writes with much enthusiasm, and gives a clear and pleasant account of the history and the features of the fabric, and his labour has produced a very valuable addition to the cathedral series.

The Cathedral Church of Gloucester. By H. J. L. J. Massé, M.A. London: Geo. Bell and Sons, 1898.

### A USEFUL BOOK.

A fifth enlarged and revised edition of Professor Banister Fletcher's well-known book on *Dilapidations* will be a useful addition to this year's output of works relating to the practice and business of Architecture. It is essential to the full utility of a book which assumes, as does this one, to be at once a text book, a handbook, and an epitome of the Acts and law decisions relating to dilapidations, that it should be kept closely up to date, and held abreast of those constant modifications in the law, resultant from the decisions of the courts from time to time. It is therefore satisfactory to know that the demand for the Professor's book has justified yet another edition. In this reprint the author, beside carefully revising the work, omitting all matter which has become obsolete, and adding the results of late cases, has further added the sections of the Ecclesiastical Dilapidations Act (1871), and has considerably extended the series of questions and answers upon points of practice, which has hitherto formed a useful adjunct to the main bulk of the volume. The usefulness of the work as a book of reference for the practitioner, is further augmented by a comprehensive index and a reference table to law cases cited in the text. Mr. Edward Uttermare Bullen, Barrister-at-Law, has again assisted, and has revised the legal portion of the last edition. The book is, we think, a valuable and a useful book and is, no doubt, as the author says, the result of much labour, and will save the reader from reading through many volumes; but we have to complain that with all the care that has been taken to tabulate and epitomise the information which the book contains, Professor Banister Fletcher has yet many pages, which not only do no service to any question at issue, but are a positive annoyance to those who turn to the book for the purposes of reference or study which it is designed to fill. The recondite quotation from one of Shakespeare's plays, which appears on the title page, strikes the key-note of a certain spirit of irrelevancy which pervades the book. The trite reference to Vitruvius and the wagish picture of the "young architect," which appear in the first page of the introductory chapter, serve no purpose and are tiresome and prejudicial to the volume. The stories told at intervals throughout the book, although they may have gratified the author in the telling, detract from the dignity proper to the subject, and are quite unjustified as illustrations. It is also quite irrelevant, to say the least, to recommend the reader to avoid a certain line of action, for the reason, among others, that it

is "not gentlemanly." This is gratuitous and offensive. The book is further marred by an inclination on the part of the author to break out in places into what we believe to be known as "fine writing." Whether the writing in this case is fine or not we do not pretend to decide, but such passages are quite outside the scope of a practical guide on the subject of Dilapidations, even without the quoted verses which the Professor interpolates. These passages not only gravely detract from the usefulness of the book, but in our opinion are ludicrous. They should be treated with liberal blue pencil when the sixth edition is under revision.

"Dilapidations." By Banister Fletcher. 5th edition. Price 6s. 6d. Published by B. T. Batsford.

### DECORATIONS FOR THE EAST WALL OF KIRKLY CHURCH.

Mr. Henry Holiday has been lately showing in his studio an important piece of decorative work which has been in hand since last May. It is to be placed at the east end of Kirkly Church, near Liverpool, and consists of a central panel in mosaic, which is to come above the altar, and is surrounded by a framing of alabaster, separating it from the filling of "opus sectile" which flanks it on each side, and extends to the north and south walls. For the benefit of those to whom the phrase is expressionless, it may be stated that "opus sectile" is a middle term between tiles, glass painting, and mosaic. It is made of a kind of vitreous paste, somewhat similar to that from which the tesserae of mosaic are cut, but having a granulated surface, and the material is shaped into largish pieces, very much in the way in which glass is cut for a stained glass window. Upon these pieces the lines of the design are printed, the firing subsequently making them indelible. The range of colour obtainable is considerable, but principally among delicate colours, dark and rich tones being, one supposes, more difficult to obtain. It is quite easy to produce by this means an absolutely permanent decoration which is practically part of the wall to which it is affixed, and which gets over the difficulty attending the use of mosaic for small details of drawing. To return to Mr. Holiday's work: Above the mosaic is a frieze of winged genii, also in "opus sectile," and the lateral compositions consist of standing symbolic figures of virtues, two on each side, between each pair of which an angel floats with wings extended on a higher level. The effect of the "opus sectile" in itself is excellent, further variety of material giving colour and texture having been obtained by the ingenious use of the thick, opalescent American glass with which the public eye is familiar in the highly decorated taverns so frequent nowadays. Used as Mr. Holiday has used it, it suggests precious and rare marbles, distinctly and specially suggesting some of the older marble on the exterior of St. Mark's, Venice. The central mosaic, representing the Last Supper, is a repetition, with improvements, of that which was shown at the Arts and Crafts Exhibition some years ago, and the designs of some of the other figures are also familiar. When an artist has thought out a conception of any particular virtue or quality, and has made it as expansive as he knows how, he no doubt feels that a departure from that type will be no improvement and that variety must be sought in different combinations of the same figures, in the case when the same qualities or symbolical figures are demanded. Yet such a practice has its commercial side!

It is always a difficult thing to successfully combine mosaic with other forms of decoration, particularly when, as in this case, the tesserae are small; and the two materials do not enhance each other's beauty. The mistake lies in using mosaic at all for positions nearer the eye than a distance of about 40ft. At that distance the tesserae and the ground blend together with a softness and sparkle of colour very pleasing to the eye, but a less distance tempts to greater minuteness of detail than the material will well bear, the end of which is such work as is produced in the Papal Manufactory at the Vatican to the great admiration of the ignorant. A. W.

## INSTITUTE OF DECORATORS.

THE recently incorporated Institute of British Decorators held their first annual general meeting at Painters' Hall, Little Trinity Lane, London, E.C., on Thursday, March 23rd, 1899. Members from all parts of Great Britain and Ireland attended this meeting, the primary object of which was to formally elect the general council, in which is vested the management of the business and affairs of the Institute.

Mr. J. D. Crace of Wigmore Street, London, was duly elected president of the Institute; Messrs. Thomas Bonnar of Edinburgh, George G. Laidler of Newcastle, Alexander G. White of Liverpool, J. C. M. Vaughan of Hereford, Robert J. Bennett of Glasgow, and Henry Gibson of Dublin, were appointed vice-presidents of the Institute; and Messrs. William Allon of South Shields, William Brown of Dundee, Charles Carlton of Glasgow, James Clark of Edinburgh, M. Cowtan Cowtan of London, M. E. Dockrell of Dublin, Isaac H. Donaldson of London, David Laing of London, John McIntyre of Dublin, Thomas Preston of Burnley, John Ratcliffe of Bolton, John Scott of Glasgow, James Sibthorpe of Dublin, John Smith of Sheffield, William G. Sutherland of Manchester, John Taylor of Birmingham, and John Whyte of Aberdeen, were appointed members of the general council.

Mr. I. Hunter Donaldson, the present Master of the Worshipful Company of Painter-Stainers, in whose Hall, in Little Trinity Lane, the Institute have their headquarters for the time being, at the opening of the proceedings addressed, in the name of the Painters' Company, a few words of cordial and sincere welcome to the members of the Institute, wishing them a full realisation of the hopes on which they had constituted the Institute.

Mr. John D. Crace, the president, then addressed the meeting as to the progress made by the Institute since the meeting of the Provincial Council in February last, and it was stated that 174 decorators had become members of the Institute, and that in addition upwards of sixty applications for membership had been received by the secretary, and would be brought up for consideration and election at the meeting of the General Council to be held at the close of the annual general meeting. Several matters of interest were brought to the notice of the meeting by the president, including the question of the admission of women, if duly qualified, as members of the Institute; and it was the general opinion of the meeting that, if qualified, they ought to be admitted. A further question of subdividing the Institute into a larger number of districts than at present was also considered, but it was thought that further inquiry should be made, and reports were invited from the various local associations.

The president then invited the members present to express their views as to the expediency of compelling applicants for admission as members of the Institute to submit to an examination before being admitted to membership, and pointed out that, in his opinion, to insist upon such a test, would be to kill the Institute at the very start, for it was obvious that men who had been in business for many years, and who were of established reputation, would not submit themselves to examination as a condition of admittance to an Institute only in its infancy. The president further stated that all applications for admission to membership of the Institute would have to come before the General Council for election, and every applicant would have to be nominated by two existing Fellows of the Institute. Every care would be taken, he said, both by the General Council and by the Fellows nominating, that no unsuitable persons should be elected; and that, at any rate for the present, this should afford the Institute a sufficient protection against the admission of unsuitable members. Several members present expressed themselves as to this view.

At a meeting of the General Council which was subsequently held, new members were elected to the number of fifty-six.

## Professional Practice.

**Aberchirder.**—A new mission hall has been erected at a cost of about £1000. The principal entrance, which takes the form of a porch built out from the main building, faces Main Street. The inside of the building is lined to a height of about 4ft. with narrow pitch-pine linings, the front of the gallery being finished with the same material. The rear portion of the building contains a classroom, a vestry, and a cloak room. On the east side of the back building, under the classroom, there is a heating chamber. The masonry in the front gable is of broken ashlar, with dressed corners, while the side walls are of plain rubble. All the material used is grey granite from the local Knockorth Quarry. The architects for the hall were Messrs. Duncan, Turriff, while Mr. Alexander M'Hardy, Aberchirder, contracted for the whole building and fittings. A new organ, by Story and Clark, Chicago, has been obtained for the hall.

**Bristol.**—A new adult school building has recently been opened at Barton Hill. The building consists of a large hall, which can be turned into a gymnasium, and three smaller rooms. The hall will hold about 450 people, and the entire building will accommodate about 1000 people. Messrs. Cotterell and Thorpe supplied the plans, and the building was constructed by Mr. W. Church. The entire cost of the building was £2600.

**Doncaster.**—A new theatre, erected at Doncaster by Mr. J. W. Chapman, was opened last Tuesday week. The old theatre in the Market Place, which was built in 1776, had become out of date, and the Corporation, who are the owners, intimated their intention of pulling it down for street improvements. The new building will seat 1500 persons. It is fitted up with modern appliances, the staircases are fireproof, and the building is supplied with Grinnell sprinklers. The stage is on the street level, and can be driven upon therefrom. It is 75ft. wide by 32ft. deep. Mr. Chapman, the manager, drew the plans, and Mr. P. Briggs, of Arundel Street, London, was consulting architect. The builders and contractors were Messrs. H. Arnold and Son, of Doncaster. The seating and decorations were by Messrs. Deans, of Birmingham; the electric installation by Messrs. Fisher and Allison, of Doncaster; Messrs. E. Oldroyd and Co., of Leeds, fixed the heating apparatus and fireproof curtain; and the fire hydrants and Grinnell sprinkler installation were fixed by Messrs. Dowson, Taylor and Co., of Leeds and Manchester.

**Inverness.**—Skibo Castle is about to be extended at a cost of £25,000. The present main part of the castle forms the east front, and the new additions will form the south and west fronts. There is to be a basement throughout the whole of the extensions, and, owing to the configuration of the ground on the west, the gunroom, 21ft. by 25ft. 6in., will be placed under the billiard-room. There are also to be in the basement an electric-room and furnace-room, wine cellars, workshop, and stores. On the ground floor there will be arranged the drawing-room, boudoir, library, private room, secretary's room, writing and smoking-room, and billiard-room. The drawing-room, which will open directly off the grand hall by wide folding-doors, will measure 36ft. 4in. by 24ft. 6in.; while the library will be 38ft. 4in. by 22ft. 4in. Off the hall there will run a main corridor, extending to the garden entrance in the west, and off this corridor will be the private apartments. The lower part of the west wall of the hall is to be removed, and three arches with marble columns will be formed. These will open into the new grand staircase, which is to be of white Sicilian marble, and lighted by three stained glass windows; while the ceiling is to be panelled. The first floor will consist of twelve rooms. The second floor will provide twelve guests' bedrooms and dressing-rooms with bathroom and lavatory accommodation. On the third floor are to be

situated seven servants' bedrooms. The central part of this floor is to be reserved for a recreation room, 63ft. long by 18ft. broad, which will also be equipped as a gymnasium. In the north-west corner of this floor there will be a tower-room, 32ft. by 21ft. From this apartment a separate staircase will lead to the roof of the tower, which will be flat, 24ft. by 35ft. 6in. The whole of the building is to be constructed upon fire-proof principles. Built of steel and concrete, the floors are to be as far as possible divided into sections, so constructed that any one section may be cut off by fire-proof doors. Electric fans are to be used for ventilation purposes, and electric light is to be installed throughout the building. The contractors are Messrs. A. and J. Smith, of Inverness, and the architects are Messrs. Ross and Macbeth, of Queen's Gate, Inverness.

**Leicester.**—A new isolation hospital is being erected about a mile and a half from Leicester, from the plans of Messrs. Blackwell and Thomson, of Leicester, and the foundation-stone was laid last week. The hospital, when completed, will consist of four separate one-storeyed pavilions for the treatment of scarlet fever, one pavilion for typhoid fever, and two isolation pavilions. The other buildings comprise an administration block, discharging block, and mortuary. The several buildings are connected by macadam roads. The facings of the buildings are of Ellistown brick, with stone dressings, and the roofs are covered with green slates.

**London, S.W.**—Wandsworth is to be provided with public baths. The buildings have been designed by Messrs. Spalding and Cross, and will cost about £20,000. The style is to be English Renaissance, and the front will be built of red bricks with Portland stone dressings. The building will have a frontage of 75ft., and an average depth of 246ft. A first-class swimming bath, 100ft. by 30ft., and a second-class bath, 85ft. by 30ft., are to be provided. There are to be six men's first-class slipper baths, thirty second-class, and four first and eight second-class ladies' baths. The baths will be able to be floored over for a gymnasium or public entertainments.

**Oldham.**—A new Sunday School in connection with Middleton Road Primitive Methodist Chapel was opened on March 22nd. It consists of a large hall with a balcony projecting over almost one half. On the balcony and beneath it are three class-rooms, which can be divided from the main room by folding doors, or thrown open to form one room to accommodate about 800 people. Messrs. Wild, Collins, and Wild, of Oldham, are the architects.

**Southampton.**—A monument has been erected in the Southampton Cemetery to the memory of the late Mr. A. J. Dyer, J.P. It is 8ft. in height, the plinth is 3ft. 6in. wide, is of grey Yorkshire stone, and from it rises a moulded base and pedestal of Portland stone. The whole is surmounted by a canopy supported by red Peterhead granite columns with moulded bases and carved capitals. The work was designed and executed by Messrs. Garrett and Haysom, of Southampton.
